Cabinet Terminations and Critical Events Daniel Diermeier and Randolph T. Stevenson Equilibria in Campaign Spending Games: Theory and Data Robert S. Erikson and Thomas R. Palfry

The Meaning and Measure of Policy Metaphors Mark Schlesinger and Richard R. Lau The Sovereignless State and Locke's Language of Obligation John T. Scott

Erratum:

In his Presidential Address, "The Competence of Political Science: 'Progress in Political Resarch' Revisited," which appeared in the March 2000 issue of the Review, Matthew Holden discussed the article by Frank R. Baumgartner and Beth L. Leech, "The Multiple Ambiguities of 'Counteractive Lobbying,' "American Journal of Political Science 40 (May 1996): 521-42, which is a critique of David Austen-Smith and John R. Wright, "Counteractive Lobbying," American Journal of Political Science 38 (February 1994): 25-44. In his footnote 20, page 10, Holden stated that "using J-STOR, I am surprised not to have found a response by the authors they critiqued." Austen-Smith and Wright did reply to the Baumgartner and Leech critique in their article "Theory and Evidence for Counteractive Lobbying," American Journal of Political Science 40 (May 1996): 543-64. Baumgartner and Leech then responded to the Austen-Smith and Wright reply in their article, "Good Theories Deserve Good Data," American Journal of Political Science 40 (May 1996): 565-9. On the first page of this last article, the editor of the AJPS noted, "To provide closure on the debate, Professors Austen-Smith and Wright were not asked to respond to this manuscript.

Editor's Notes

INSTRUCTIONS TO CONTRIBUTORS

General Considerations

The American Political Science Review strives to publish scholarly research of exceptional merit, demonstrating the highest standards of excellence in conceptualization, exposition, methodology, and craftsmanship. Because the Review reaches a diverse audience of scholars and practitioners, contributors should demonstrate how their analysis illuminates a significant research problem, or answers an important research question, of general interest in political science. For the same reason, authors should strive for a presentation that will be understandable to as many scholars as possible, consistent with the nature of their material.

Since the Review publishes original research, authors should not submit articles containing tables, figures, or substantial amounts of text already published or forthcoming in other places, or that are included in other manuscripts submitted for review, whether to book publishers or periodicals (including online journals), or are otherwise committed. In many such cases, subsequent publication of this material would violate the copyright of the other publisher. The APSR also does not consider papers currently under review at other journals or that duplicate or overlap with parts of larger manuscripts that have been submitted to other publishers (including publishers of both books and periodicals). Since space is at a premium, submission of articles substantially similar to manuscripts submitted or published elsewhere, or to part of a book or other larger work, is also strongly discouraged. If there is any doubt about whether these policies would apply to a particular case, the author should discuss any such publications related to a submission in a cover letter to the Editor. The Editor should also be notified of any related submissions to other publishers, whether for book or periodical publication, that occur while an article is under review at the APSR and that would fall within the scope of this policy. Copies of related publications may be requested.

For manuscripts containing quantitative evidence and analysis, authors should describe their empirical procedures in sufficient detail to permit reviewers to understand and evaluate what has been done and, in the event the article is accepted for publication, to permit other scholars to carry out similar analyses on other data sets. For example, for surveys, at the least, sampling procedures, response rates, and question wordings should be given; authors are encouraged to calculate response rates according to one of the standard formulas given in The American Association for Public Opinion Research, Standard Definitions: Final Dispositions of Case Codes and Outcome Rates for RDD Telephone Surveys and In-Person Househould Surveys (Ann Arbor, MI: AAPOR, 1998). This document is available on the Internet at http://www.aapor.org/

ethics/stddef.html>. For experiments, provide full descriptions of experimental protocols, methods of subject recruitment and selection, information about any payments and debriefing procedures, and other relevant details. It is desirable for articles to be self-contained, and authors should not refer readers to other publications for descriptions of these basic research procedures.

Please indicate variables included in empirical analyses by capitalizing the first word in the variable name and italicizing the entire variable name the *first* time each is mentioned in the text. Authors should also be consistent in using the same names for variables in text and tables, and avoid overuse of acronyms and computer abbreviations when discussing variables in the text. All variables appearing in tables should have been mentioned in the text and the reason for their inclusion in the analysis discussed.

As part of the review process, authors may be asked to submit additional documentation if procedures are not sufficiently clear; the review process works most efficiently if such information is given in the initial submission. If readers are advised that additional information is available from the author, printed copies of that information should be submitted with the manuscript. If the amount of this supplementary information is extensive, please inquire about alternate procedures.

The APSR uses a double-blind review process. Authors should follow the guidelines for preparing anonymous copies in the "Specific Procedures" section below.

Manuscripts that are largely or entirely critiques or commentaries on previously published articles will be reviewed using the same general procedures as for regular articles with one exception. In addition to the usual number of reviewers, such manuscripts will also be sent to the scholar(s) whose work is being critiqued, in the same anonymous form as they are sent to other reviewers. Comments from the original author(s) to the editor will be invited as a supplement to the advice of regular reviewers. There are several purposes for this notice to the original author(s): (1) to encourage review of the details of analyses or research procedures that might occasionally escape the notice of disinterested reviewers; (2) to enable prompt publication of critiques by supplying critiqued authors with early notice of their existence and, therefore, more adequate time to reply; (3) as a courtesy to critiqued authors. Authors of critiques should therefore send as many additional copies of their manuscripts as will be required for this purpose.

Manuscripts being submitted for publication should be sent to Professor Ada W. Finifter, Editor, American Political Science Review, Department of Political Science, Michigan State University, 303 South Kedzie Hall, East Lansing, MI 48824-1032. Correspondence concerning manuscripts under review may be sent to the same address or, preferably, by e-mail to apsr@ssc.msu.edu. Please note that the APSR does not process new manuscripts during August; new manuscripts should be mailed to arrive either before or after. Invited revisions and reviews may be submitted at any time and will be processed upon arrival.

Manuscript Formatting

Manuscripts must not be longer than 45 pages including text, all tables and figures, notes, references, and appendices. The page size guideline is based on the U.S. standard 8.5 X 11 inch paper and must be adjusted accordingly by authors who are submitting manuscripts printed on longer paper. Font size must be at least 11 point for all parts of the paper. The entire paper must be double-spaced, with the sole exception of tables for which double-spacing would require a second page otherwise not needed. All pages should be numbered in one sequence, and text should be formatted using a normal single column no wider than 61/2 inches, as is typical for manuscripts (rather than the double-column format of the published version of the Review), and printed on one side of the page only. Include an abstract of no more than 150 words. The American Political Science Review style of embedded citations should be used, and there must be a separate list of references at the end of the article. Please do not use footnotes for simple citations. These specifications are designed to make it easier for reviewers to read and evaluate papers. Papers not adhering to these guidelines are subject to being rejected without review.

For submission and review purposes, authors are encouraged to place footnotes at the bottom of the pages instead of using endnotes and may locate tables and figures (on separate pages and only one to a page) approximately where they fall in the text. However, manuscripts accepted for publication must be submitted with endnotes, and with tables and figures on separate pages at the back of the manuscript with standard indications of text placement, e.g., [Table 3 about here]. In deciding how to format your initial submission, please consider the necessity of making these changes if your paper is accepted. Authors of accepted manuscripts are also required to submit camera-ready copy of graphs or other types of figures. Instructions will be provided.

For specific formatting style of citations and references, please refer to any articles in the most recent issue of the *Review*. For unusual style or formatting issues, authors may consult *The Chicago Manual of Style*, 14th edition. For review purposes, we do not require that citations and references be in specific *APSR* format, although some generally accepted format should be used, and all citation and reference information should be provided.

Specific Procedures

Please follow these specific procedures for submission:

1. Submit five copies of manuscripts. Please review all pages of all copies to make sure all copies contain all

- tables, figures, appendices, and bibliography mentioned in the manuscript and that all pages are legible.
- 2. To comply with the *Review*'s policy of double-blind peer reviews, only one of the five copies submitted should be fully identified as to authorship and four should be in anonymous format.
- 3. For anonymous copies, if it is important to the development of the paper that an author's previous publications be cited, this should be done in a way that does not make the authorship of the submitted paper obvious. This is usually most easily accomplished by referring to oneself in the third person and including normal references to the work cited in the list of references. Under no circumstances should an author's prior publications be included in the bibliography in their normal alphabetical location but with the author's name deleted. Assuming that text references to an author's previous work are in third person, full citations should be included as usual in the bibliography. Use of other procedures to render manuscripts anonymous should be discussed with the Editor prior to submission. Authors also should not thank colleagues in notes or elsewhere in the body of the paper or mention institution names, web page addresses, or other potentially identifying information. All acknowledgements must appear on the title page of the identified copy only. Manuscripts that are not judged anonymous will not be reviewed.
- 4. Cover pages: The first page of the four anonymous copies should contain only the title and an abstract of no more than 150 words. The first page of the identified copy should contain (a) the name, academic rank, institutional affiliation, and contact information (address, telephone, fax, email) for all authors; (b) in the case of multiple authors, an indication of the author who will receive correspondence; (c) any relevant citations to the author's previous work that have been omitted from the anonymous copies; (d) acknowledgements, including the names of any colleagues who have provided comments to the author on the manuscript. If the identified copy contains any unique references or is worded differently in any way, please mark this copy with "Contains author citations" at the top of the first page.
- Please also send a loose copy of the cover page of the identified copy.
- 6. Authors having access to e-mail should send a copy of the abstract to apsr@ssc.msu.edu, when the submission is mailed. The subject line should contain the word Abstract followed by the first listed author's last name. The body of the message should contain the title of the paper, the names of all authors, and the abstract (as on the loose page described above). E-mail submission of the abstract is not required but will help us process your manuscript more efficiently.
- 7. Authors should not fax abstracts, send any part of the paper itself by e-mail, or send the abstract by e-mail before their submission packet is in the mail.

No copies of submitted manuscripts can be returned. Since submission procedures may be modified in the future, authors are encouraged to check for current instructions in the most recent issue of the *Review* or at our Internet web site, http://www.ssc.msu.edu/~apsr/.

ELECTRONIC ACCESS TO THE AMERICAN POLITICAL SCIENCE REVIEW

Full text of the American Political Science Review is available in several electronic formats and through several different venders.

Except for the last three years (as an annually "moving wall"), back issues of the American Political Science Review beginning with Volume 1, Number 1 (November 1906) are available online through JSTOR (http://www.jstor.org/). Issues through Volume 89, Number 4 (December 1995) are currently available. At present, while JSTOR's complete collection is available only via institutional subscription, individual subscriptions to the APSR part of JSTOR are now available to APSA members. Please contact Member Services at APSA for further information.

Full text access to current issues of both the APSR and PS is also available online by library subscription from a number of database vendors. Currently, these include University Microfilms Inc. (UMI) (via its CD-ROMs General Periodicals Online and Social Science Index, and the online database ProQuest Direct), Online Computer Library Center (OCLC) (through its online database First Search as well as on CD-ROMs and magnetic tape), and the Information Access Company (IAC) (through its products Expanded Academic Index, InfoTrac, and several online services [see below]). Others may be added from time to time.

APSR is also available on databases available through six online services: Datastar (Datastar), Business Library (Dow Jones), Cognito (IAC), Encarta Online Library (IAC), IAC Business (Dialog), and Newsearch (Dialog).

The editorial office of the APSR is not involved in the subscription process to either ISTOR for back issues or the other vendors for current issues. Please contact APSA, your reference librarian, or the database vendor, as appropriate, for further information about availability.

BOOK REVIEWS

All book review correspondence should be sent to the Book Review Editor, Professor Mark Lichbach, American Political Science Review Book Review, Department of Political Science, University of California, Riverside, Riverside, CA 92521-0118. E-mail: apsrbook@wizard.ucr.edu. Authors wishing their book to be considered for review should ask their publisher to send a copy to the Book Review Editor. Those interested in reviewing books should send their vita to the Book Review Editor.

OTHER CORRESPONDENCE

The American Pólitical Science Association's address, telephone and fax are: 1527 New Hampshire Avenue,

NW, Washington, D.C. 20036, (202)483-2512, and fax (202)483-2657. E-mail: apsa@apsanet.org. Please direct correspondence as follows:

Information, including news and notes, for PS Dr. Robert J-P. Hauck, Editor, PS E-mail: rhauck@apsanet.org

Circulation and subscription correspondence (domestic claims for nonreceipt of issues must be made within four months of the month of publication; overseas claims, eight months)

EXEDITING REQUESTS FOR COPYING APSR AND PS ARTICLES FOR CLASS USE AND OTHER PURPOSES

Class Use

The Comprehensive Publisher Photocopy Agreement between APSA and the Copyright Clearance Center (CCC) permits bookstores and copy centers to receive expedited clearance to copy articles from the APSR and PS in compliance with the Association's policies and applicable fees. The general fee for articles is 75 cents per copy. However, current Association policy levies no fee for the first ten copies of a printed article, whether in course packs or on reserve. Smaller classes that rely heavily on articles (i.e., upper level undergraduate and graduate classes) can take advantage of this provision, and faculty ordering ten or fewer course packs should bring it to the attention of course pack providers. APSA policy also permits free use of electronic library reserve with no limit on the number of students who can access the electronic reserve. Both large and small classes that rely on these articles can take advantage of this provision. The Copyright Clearance Center's address, telephone, and fax are: 222 Rosewood Drive, Danvers, MA 01923, (978)750-8400, and fax (978)750-4474. This agreement pertains only to the reproduction and distribution of APSA materials as hard copies (e.g., photocopies, microfilm, and microfiche).

The Association of American Publishers (AAP) has created a standardized form for college faculty to submit to a copy center or bookstore to request copyrighted material for course packs. The form is available through the CCC, which will handle copyright permissions.

APSA also has a separate agreement pertaining to CCC's Academic E-Reserve Service. This agreement allows electronic access for students and instructors of a designated class at a designated institution for a specified article or set of articles in electronic format. Access is by password for the duration of a class.

Please contact your librarian, CCC, or the APSA Reprints Department for further information.

APSR Authors

Authors of APSR articles may use their own articles in course packs or other printed materials without payment of royalty fees and may post their articles at personal or institutional web sites as long as the APSA copyright notice is included.

Other Uses of APSA-Copyrighted Materials

For any further copyright issues, please contact the APSA Reprints Department.

INDEXING

Articles appearing in the Review before June 1953 were indexed in The Reader's Guide to Periodical Literature. Current issues are indexed in ABC Pol Sci; America,

History and Life 1954-; Book Review Index; Current Contents: Social and Behavioral Sciences; EconLit; Energy Information Abstracts; Environmental Abstracts; Historical Abstracts; Index of Economic Articles; Information Service Bulletin; International Index; International Political Science Abstracts; The Journal of Economic Literature; Periodical Abstracts; Public Affairs; Recently Published Articles; Reference Sources; Social Sciences and Humanities Index; Social Sciences Index; Social Work Research and Abstracts; and Writings on American History. Some of these sources may be available in electronic form through local public or educational libraries. Microfilm of the Review, beginning with Volume 1, and the index of the Review through 1969 are available through University Microfilms Inc., 300 North Zeeb Road, Ann Arbor, MI 48106 (www.umi. com). The Cumulative Index to the American Political Science Review, Volumes 63 to 89: 1969-95 is available through the American Political Science Association.

The Competence of Political Science: "Progress in Political Research" Revisited Presidential Address, American Political Science Association, 1999

MATTHEW HOLDEN, JR. University of Virginia

Political science is two realms, the intellectual and the organizational, and the task is to consider how the organizational realm might be adapted to the highest improvement of the intellectual realm. Political science has a certain competence (domain) in the study of politics as the organization of power. It also seeks to expand competence as capability. Charles Merriam provides a point of departure. Merriam's most successful idea has been that of enhancing competence through improvements in "the field of method." Competence, however, now demands methodological flexibility, so as to probe more into the exercise of power. Four fields are strategic: public administration, political interests, urbanization, and the interpenetration of politics and economics. Competence also leads into unorthodox subjects, such as force and foolish, irrational, and pathological decision making (or "the Oxenstierna-Mullins Effect"). Finally, competence demands (and is enhanced by) the reach of political science into serious practical problems of human affairs.

n framing this address I thought about my longtime friend, Aaron Wildavsky, who was, as Paul Sniderman said recently,1 consciously or otherwise an advocate for political science. Once, he disagreed with something I said, and his query came back: "But what shall we teach the young?" He understood the folly of recruiting and helping to educate human beings and at the same time pummeling them into conscious disdain for what they do. In that sense, I take on an advocate's role self-consciously. The young scholar learns to think about where the discipline is going, and this is important. But it is so much more important to think where the discipline ought to go and to rise above pettiness in so doing. This is about the calling, or about the purpose to be served by political science and by one's work in political science.

The calling—obligation or even duty, to use a very old-fashioned word—is to enhance the competence of political science in the interest of human understanding. This depends, among other things, on ideas to guide research and on strategic conceptions about what research is worth the efforts of grown men and women. In political inquiry, human beings still see, as St. Paul said, through a glass darkly. The task that justifies the allocation of social resources to support a political science is the task of seeking knowledge that would make it possible to see through the glass a little more clearly. Thomas Hobbes ([1651] 1991) starts with two crucial issues: how to create political order and civilized life and how to discover the ways of doing so. Hobbes lived in a world of extraordinary turbulence and saw the vast ignorance with which people sought to meet that turbulence. It led him to theoretical extremes which give him the bad reputation that makes him unwelcome today. "The skill of making and maintaining commonwealths ... consisteth," he wrote, "in certain rules... which neither poor men have had the leisure, nor men that have had the leisure, have hitherto had the curiosity or the method to find out" (p. 145).

The search for the rules of politics, which will explain what is involved in the making and maintaining of commonwealths, is the calling. The world of political science is two realms, intellectual and organizational. The intellectual realm is contained in the theories, hypotheses, doctrines, facts, and so forth, that are embodied in our study and our teaching about the parameters of politics (culture, economics, climate, demography, etc.), outer limits of which are set in the extreme case by human heredity and nonhuman environment; the institutions and actual processes of action in politics (adjudication, legislation, administration, elections, coalition formation, factions, committees, wars, agitation, resistance, persuasion, etc.); and the product of politics (policies, programs as decisions subordinate to policies, operational decisions as subordinate to programs, etc.).

Political science is also an organizational realm of departments, schools, journals, editors, applications, review committees, and so on. This organizational realm is a human network with something akin to its own largely unwritten "constitution." It has a set of more or less definitive understandings as to who is a member (full, partial, or potential), who is an acceptable outsider, with some legitimate presence, and who is entirely excluded. These understandings extend to posts of honor, eligibility for them, and accession to them. They extend to decision process rules, rules as to substantive outputs (which are mandatory, which permissible, and which impermissible), and some understandings as to rules for changing the rules.

These two realms shape each other, although I think the intellectual realm is largely the expression of what people in the organizational realm do. In the organizational realm, however, the purpose of what we teach is to enable young scholars to enter, and entering, to make a contribution in the intellectual realm. Career is

Matthew Holden, Jr., is Henry L. and Grace M. Doherty Professor of Government and Foreign Affairs, University of Virginia, Charlottesville, VA 22901.

¹ Private conversation, August 1999.

mere necessity, but calling is far more important than career.

THREE LEVELS OF KNOWLEDGE

The young scholar needs to learn to understand at three levels. First, he or she must acquire what is taught expressly. That is the first level. Second, the young scholar should come to understand what lies beneath what he or she is being taught. What were the assumptions, facts, methods, and subtleties that shaped what the teacher understood clearly, but lacked time, incentive, or sometimes means expressly to communicate? Third, he or she must understand what lies beneath the beneath. What was the intellectual history and atmosphere that affected the teachers' teachers? Deep grounding in the literature is a necessity.

On such a premise, I revisit the presidential address of Charles E. Merriam (1926), entitled "Progress in Political Research." I will not go very far into the overall career of Merriam, although the temptation is great. His relationships to his students, Chicago politics and politicians, the national government under Hoover and Roosevelt, foundations, the political science and social science communities, and the University of Chicago's president, Robert Maynard Hutchins, all are worth the kind of treatment that Robert Skidelsky (1994) gave to John Maynard Keynes (see also Karl 1974).

My choice is to describe Merriam's presidential address, what political scientists have taken from it, what elements remain to be developed, and what are its implications at the end of one century and the beginning of another. When I was a graduate student, behavioralism was on its upswing. In that time of intense exchange between "behavioralists" and "traditionalists," Merriam was the scholar who seemed to have anticipated it all, but with a firm grasp of hard political realities. His expressed approach, more than that of any other scholar, provided the scope that I found helpful in going beneath the beneath. "We do not," he said, "teach all that we know, and are driven sometimes to teach what we are not so sure of." The moral is: "Take a chance intellectually, because you do not have to know that what you are proposing is true before you begin to investigate it." He also said that the existing conventional categories are by no means the only ones for studying important matters relating to power. We might, he said, "have studies of the use of force in political situations, and its opposites, passive resistance and noncooperation; ... the nature of political interests; ... use of magic, superstition, and ceremonialism in politics; ... propaganda; ... the actual process used in conference, so significant a function in modern affairs; ... the maintenance of political morale; ... leadership, obedience, cooperation; ... the causes of war as well as its diplomatic history and law" (Merriam 1926, 6). Merriam in 1925 thus issued what was a veritable charter for the more adventurous program that has characterized behavioral political science at its most expansive.

I adapt the Merriam themes by including in my title

"the competence of political science." Competence means the capacity to do something. It means what one possesses, as in a Victorian novel a young person with some trust income is described as having "a competence." It also means the domain in which one has the right to act, as in the term a "competent" court.² To claim competence is not to say there is no need for self-improvement. Of course there is a need for self-improvement.

In the culture of political science there is sometimes a certain anxiety. Young scholars learn to justify arguments with the phrase "political science has neglected." The phrase implies intellectual or moral negligence, as if people knew what they should have done but did not do it. But this bespeaks an emotional not an intellectual state. It is an inheritance from years ago, certainly after World War II. Political scientists learned a certain inverted Pharisaism: "God knows, I am not as good as other scientists are." It would surprise me not the least if similar views were entertained by many deans, provosts, and presidents across the country. The term "self-hatred" has come, from psychoanalysis, into discussions of group behavior. It is used to describe a member of a group who treats the group with disesteem and seeks acceptance into some other group of higher standing. Under such a condition, it would also not be surprising if some members of the discipline would wish to assimilate to disciplines of higher status (to be taken by economists for economists) and look down at other colleagues who do not have the same wish or capacity. (Sometimes we compensate by seeking others we can snub, although in the end that is counterproductive.3) It is hardly surprising that there is a need for a good infusion of self-respect and selfconfidence, and along with self-confidence a degree of intellectual respect that allows differences to be examined with some precision and clarity.

IN BEHALF OF OURSELVES: WE KNOW MORE ABOUT POLITICS THAN DO OTHER SCHOLARS

Of course, our discipline is greatly imperfect. What discipline, profession, or human activity is not? Law? Medicine? Theology? Psychiatry? Economics? True, some other disciplines are logically more coherent. They have a dominant set of assumptions, theories, methods, and data, although none of the social sciences approach the coherence of physics, chemistry, or biology. Some are equipped with better mathematicians. Someday we may get closer to the standards in those fields. But, as far as we are, we know more politics than

² See Garner 1999: "competence, n...2. The capacity of an official body to do something, 'the court's competence to enter a valid judgment.'"

³ One of my graduate school contemporaries, a famous political scientist I will not name, said that at a certain stage of his life, he and his friends used to stand near the education faculty as they marched into commencement and conspicuously call them "mister." If this is still our attitude, it can only obstruct our need to infuse what we know from political science into primary and secondary education.

any other discipline. It is our business to know politics, however imprecisely we state it.

There is, I contend, one common thread in politics: the organization of power. The concepts, techniques, or data of international politics, comparative politics, American politics, and so forth, are translatable each into the language of the other. Power is the key to political practice and, accordingly, to the study of that practice. The competence (domain) of political science is the study of the parameters, processes, and products of power. Its competence (intellectual capability) also extends to wherever human beings organize power, whether it is called officially "public" or "private." This is the point of view that I attribute to Charles Merriam, and I now turn to an excursus on method and then to some big issues within conventional fields where there are significant opportunities.

MERRIAM'S FORMULATION OF PROGRESS AND THE TRIUMPH OF METHOD

When Merriam (1926) chose as his subject "Progress in Political Research," the American Political Science Association was twenty-one years old. Merriam concluded that "these twenty-one years have been a period of substantial progress and solid achievement, more than justifying the expectations of those who aided in launching the Association" (p. 4). In 1999, we should recall that the original objectives were by no means theoretical only. At first, there was a proposal to create the American Society of Comparative Legislation (Dodd 1904, 6). The originators soon concluded that it would be better to have a broader society "to embrace the whole field of Political Science, and thus embrace Comparative Legislation as one of its topics" (p. 6). Comparative legislation was a practical subject, "including the operation of statutes, uniform legislation, and the promotion of publications, especially indexes and digests of record material" (p. 11).

Merriam offered a summary of where he thought there had been progress and stated an agenda. The research agenda includes both what we now regard as conventional and what he expressly described as "unorthodox." He also discussed opportunities for extending political science beyond the existing academic universe. I shall discuss these in turn to show how they are pertinent to the competence of political science at the end of this century.

More specifically, Merriam saw progress in certain fields of political science and in "the field of method." He mentions the following areas: parties (Merriam 1926, 2–3), political theory (p. 10), international relations and international law, constitutional law, public administration (including administrative law and organization), legislation, and problems of the modern city (p. 1). Indeed, he said, "it would be interesting to examine the fact-content of these various inquiries and to develop the various principles and conclusions that have been established, but the limits of this discussion will not permit such an appraisal" (p. 3).

These are now conventional (standard) fields of research and teaching. The major additions since Mer-

riam's time are comparative politics and methods. The physical and intellectual growth of the discipline has occurred primarily through specialization within all these general fields. There is still considerable scope for intellectual progress. So much has happened in 74 years, and so much remains. I return to this below.

It is in "the field of method" that the most change has occurred. The political scientist of 1925 would simply be lost in 1999 material. By the same token, new scholars in 1999 are being educated in a way that leaves them with no connection to why they are doing what they are doing, or what the changes since 1925 were intended to achieve.

"In the field of method some stirrings may be observed," Merriam (1926, 2) stated, and he was often the stirrer, as his audience would have known. "On the whole, the most striking tendency of method during this period has been that toward actual observations of political processes and toward closer analysis of their meaning—this in contrast to a more strictly historical, structural, and legalistic method of approach to the problems of politics" (p. 3).

Merriam evinced in his address an unqualified commitment to "the field of method." He advocated turning concepts and data into terms subject to mathematical measurement, and the acquisition of the data was an important element. Merriam participated in these innovations to a limited degree, particularly with the help of Harold F. Gosnell and Harold D. Lasswell (Simon 1996). He was less the doer than the inspirer, sponsor, and academic entrepreneur. Merriam put a view into the following sentence. "The quantitative study of economic and other social phenomena holds large possibilities of fruitful inquiry, providing of course that the numbers and measurements are related to significant hypotheses or patterns" (p. 7).

As the inspirer, Merriam played a significant role. Quantitative analysis of politics had not been established as a strong central concept, although it was not an unknown idea. Francis Lieber ([1853] 1877), the German-born political scientist, said in 1853 that he had long been interested in election statistics from many countries (see Freidel 1947, 292-5; Haddow 1939, 138-44; Lieber 1993, 21-32; Merriam [1903] 1969; Nevins and Thomas 1952). Some historians working on politics in the 1890s had begun this kind of work. A. Lawrence Lowell, closer in time to Merriam, was on the quantitative trail. In his 1910 presidential address, Lowell anticipated Merriam: "The more complex the phenomena to be studied, the greater the care that must be used in accepting the conclusions given by statistics, and yet in political science they are invalu-

⁴ I have consulted (1) some widely known scholars who are good judges of quantitative methods; (2) Political Analysis, the specialized journal of political methodologists; and (3) cursorlly, the last two years of the APSR, the American Journal of Politics, the Journal of Politics, and the Political Science Quarterly. In this part of the preparation, in particular, I had the excellent help of Amy Kristen Stewart. I have also had the benefit of discussion over the past several years with Paul Freedman and Marc Hetherington, whose explanations have been helpful. In this subject matter, above all, the errors are mine, and no one should blame Preedman, Hetherington, or Stewart for any of it.

able" (pp. 10-1). According to Rogers (1968, xxxi), "if there was not mathematics [in Lowell's writing], at least he used numerals."

Fifteen years after Lowell's presidency came Charles Merriam. At that time, the requirements were still more or less literary: command of the English language, sufficient ability to read German or French, and passage of the field course in political philosophy or history of political theory. As to the dissertation, it was not unusual for a student to choose a topic, or be given one, and write the project with little or no further consultation with the faculty. Merriam proposed a major change in both procedure and substance. Those who studied political science at Chicago testify that Merriam was different, including Herbert Simon (1996, 57, 63), C. Herman Pritchett, Gabriel Almond, and Robert E. Martin. 6

On the whole, political science had accepted this emphasis by the early 1930s. The most obvious form was modern polling techniques, which made it possible to go behind the mere paper record and ask the voters directly what they did and why. This is the hallmark of the work of Angus Campbell and others at the Survey Research Center in Ann Arbor. This procedure became the norm, the expected standard.

Quantification and/or mathematical analysis now appears in virtually every field—international relations, comparative politics, state and local politics, judicial behavior—with the possible exception of political theory. Some major journals are virtually closed to anything else, and most carry a great deal. Very few are predominantly narrative. The same pressure is present, although not to the same degree, in the most prestigious university presses.

Dimensional analysis, model specification, refined distinctions among different types of designs, quasi-

⁵ Thus is shown in the way Emmette S. Redford wrote his dissertation at Harvard. He had great enthusiasm and respect for Charles H. McIlwain at Harvard but decided not to work on political philosophy because he was not good at foreign languages. "McIlwain did not think one should major in political philosophy unless he knew French, German, Latin, and probably Greek." Ultimately, Redford wrote under Arthur Holcombe, who gave him a topic (constitutional problems of American economic planning). He wrote the dissertation without discussing it with anyone, as far as he remembered in later years (Redford interview by William S. Livingstone [Baer, Jewell, and Sigelman 1991, 57]). The way Redford worked at Harvard probably was about the same over the rest of the United States into the 1960s. (It was the way I worked with Norton Long at Northwestern.)

experiments and challenges to the very idea of them, operationalization or measurement of variables and concepts, time-series analysis, panel and cohort analysis, maximum likelihood estimation, Monte Carlo simulation, and bootstrapping are standard matters for the education of new scholars.

Almost twenty years ago Nathaniel Beck (1983, 557) reported the maturation of the statistical study of time series: "While this is not the place to discuss the theoretical merits of these studies, one must be impressed by the growing methodological sophistication of the discipline's graduate students who are now expected to add ARIMA (autoregressive integrated moving average) and GLS (generalized least squares) to their list of acronyms." The list of acronyms grows, as does the need to know how to perform the operations. Young scholars who do not develop this capacity to some minimal degree will be at a disadvantage. Senior scholars who never developed this capacity or have allowed it to wither have to refresh it. Otherwise, they will be like the residents of a country who cannot speak the language of a flood of new migrants.

Indeed, many of us are learning to speak the migrants' language, however ungrammatically. But what of the migrants' ideas? Has the rapid saturation of quantification/mathematical analysis been unrelievedly beneficial for progress in scientific content in politics? When one probes deeply into content, the answer is "no" or "not yet," although this answer requires some nuance. Advanced quantitative/mathematical political science has been striking in regard to electoral studies. and in a lesser degree to legislation—a point to which I return momentarily. Yet, overall, substantive improvement in the whole body of political science is not commensurate with the rate of change in quantification and mathematics. The substantive part of the Merrian program has been fulfilled to a far more limited extent, and in some respects it is virtually untested. The word "method" meant more to him than quantification merely, and in this respect Merriam has been stymied, if not entirely defeated.

If we say Merriam's substantive agenda is not worth studying, that is one answer. If we say that it is worth studying, and that others are doing it well enough already, that is another answer. Either could be advocated or opposed. But to do so explicitly is to proceed in accord with the idea that young scholars should be encouraged to think much more about calling. There is a need for far greater intensity about deciding what is worthy studying and why, actually studying it, reporting it, and distilling its essence into the aggregate body of knowledge.

The competence of political science is, in some respects, vastly enhanced by the triumph of the field of method, but not without costs. With respect, I suggest that the decision rules within our organizational realm—as practiced in the aggregate by deans, department chairs, promotion and tenure committees, conference program committees (to a lesser extent), journal editors, and grant review panels—have a tendency to suppress discovery. But discovery is the name of the game. Herbert Simon (1996), who made thinking one

⁶ Pritchett said: "We were propelled into an acceptance of the fact that political science was a social science and was obligated to use the methods of the other social sciences" (Pritchett interview by Gordon Baker [Baer, Jewell, and Sigelman 1991, 109]). Gabriel Almond stated: "While I suffered a bit at the beginning of my career because a Ph.D. in political science from Chicago was a little unconventional, I got an enormous advantage out of it in the period after World War II, when I discovered that I was about a decade ahead in terms of my training as compared with colleagues in my age group" (Almond interview by Richard A. Brody [Baer, Jewell, and Sigelman 1991, 123]). Robert E. Martin commented in the same mode, referring to himself: (I was) "the first black political scientist to do a doctoral dissertation in political science with heavy reliance on quantitative methodology my study of the AAA referenda, which produced hundreds of statistical tables and numerous graphs" (Martin interview by Russell Adams [Baer, Jewell, and Sigelman 1991, 162]).

of his many specialties, is uncertain exactly how he thinks. He is satisfied if he can form problems through loose unrigorous symbols in the mind, subject to proof later. If that is so for Simon, surely it is so for the rest of us. At least it is for me. Some costs are too high, and some adjustments are intellectually feasible.

THE OLD LITERATURE AND HISTORY STILL COUNT

The corpus of political science is, and will long continue to be, a source from which important understanding can be distilled. In this I include political theory of the grand tradition (Holden 1996, 16-20), which is not a subject I studied well. In pondering some problems of public administration, I wondered which of the earlier writers would have been concerned with such matters. By no analytical process that I can identify, Hobbes came to mind, which in a millisecond I justified on the basis that Hobbes would have to be concerned with executive power. He was. Thus, when I went to consult Hobbes ([1651] 1991, chap. 23) I found a concept of "staff" and "line" quite as serviceable as that in contemporary public administration. It is useful to know that the concept had a good formulation three hundred years before it came into American writing.

This to me was evidence not of the backwardness of American scholarship but of the underlying permanence (or at least recurrence) of the phenomenon. For instance, I find great intellectual power in the dictum that "the making and maintaining of commonwealths" depends on skills that have to be studied, not merely on practice. For look what a mess practice has produced (Hobbes [1651] 1991, chap. 20). Deutsch's (1953; Deutsch et al. 1957) movement, in an early quantitative format, from nationalism and social communication to the historical problem of integrating the European political communities is very close to this idea, and both are helpful. That does not mean my preference is limited to political theory of the grand tradition. There is also the vast store of empirical literature—based on experiential observation or reporting and not primarily normative—that has accrued over the course of political science's existence.7

The potentialities of a political science of history also warrant our attention (Holden 1999). That merely means the application of analytical questions or principles of political science to data, extracted from such records as we obtain or re-create, about the actions and behavior of people long since dead. It is highly probable that many of the things we believe about the United States (or any other country, perhaps) will be altered significantly by close study of data from the past.

Beyond this, I propose a deliberate decision to encourage "soft" research. Merriam (1926, 2) referred

approvingly to an improvement in methods: "The most striking tendency of method during this period has been that toward actual observations of political processes and toward closer analysis of their meaning." What are the ways of actual observation? One of the ways of "actual observation," is participant observation (Holden 1996). It remains the best single method of hearing and seeing directly what politicians do as they are doing it. The work produced by its most consistent and explicit advocate, Richard Fenno, receives nothing but well-merited praise (Fiorina 1996, 90). Yet, the methodologists hardly take note of his writing on the method that he himself employs (Fenno 1990).

The triumph of method to which I refer has carried us away from the aspiration toward actual observations. Reinvigorating such qualitative research is desirable because, at minimum, it is a precursor to quantitative work that may yet be years away. Participant-observation has been the subject of one article in the leading annual on methods. I am aware of no other, although in some disciplines it has been reconceived as ethnographic research (Schwartzman 1993). Merriam found that the most striking tendency in methods was the use of "actual observation of political processes and closer analysis for their meaning," but the tendency has been sharply reduced. This works against the competence (knowledge and capability) of political science.

Leaving aside the observation method for a moment, I turn to the importance of thinking. Simon (1996, 106-7) says that he used mathematics as a means of thought, and this mathematics "is relatively unrigorous, loose, heuristic," and "solutions had to be checked for correctness." He found unexpectedly that Tjalling Koopmans did not agree at all. Koopmans deemed mathematics a language of proof "to guarantee that conclusions were correct, that they could be derived rigorously" (pp. 106-7). Simon could never persuade Koopmans that "the logic of discovery is quite different from the logic of verification." Their friendship continued until Koopmans's death. Perhaps had Koopmans lived longer, Simon said they might have reconciled their different views about mathematics. "It is his view, of course, that prevails in economics today, and to my mind it is a great pity for economics and the world that it does" (Simon 1996, 107).

Anything should do if it helps one formulate the problem. It is impressive that Simon had such a view. But there is no reason the same principle is not legitimate even if the problem is formed with words or even with literal pictures in the mind. There are times when the significant intellectual problems flow directly out of the solution of an instant problem. But that is not the only way. Scientific progress demands methodological flexibility.

On this point, let me recite a fish story—from ichthyology, not the liars' bench. The salmon is born,

⁷ Due to changes in style and language, it is necessary to note that "empirical" refers to experience and can be based as well upon the naturalists' method of observation as upon structured experiment. Simon (1996, 57) makes the point that his Administrative Behavior was empirical in that sense (p. 59 n.). His "Observation of a Business Decision" (Cyert, Simon, and Trow 1956), which in my opinion contains the seeds of "bounded rationality," is similarly based.

⁸ On this I have had some encouraging comment by a young colleague (and e-mail correspondent), Patrick Wolf.

⁹ The first issue of *Political Methodology* contained an article on participant-observation by Jennie-Keith Ross and Marc Howard Ross (1974). I believe this first article may have been the last on the subject.

ranges very far from the natal stream, returns, spawns progeny, and dies (Hasler and Scholz 1983, 12). How? The movement of the salmon from birth to death has been a subject of speculation and study for a long time. Between the 1940s and the 1970s, Arthur Hasler and his students worked out the solution. Did he get the answer from literature or experiments? No. On vacation, climbing in the mountains, he encountered "a cool breeze bearing the fragrance of mosses and columbine." The odor so impressed him "that it evoked a flood of memories of boyhood chums and deeds long since vanished from conscious memory" (p. 12). The very next sentence states: "The association was so strong that I immediately applied it to the problem of salmon homing" (p. 12).

He had the answer, but he had to find the solution, the reason for believing the answer definitively. The successive steps took several years: an hypothesis that each stream contains a particular bouquet of fragrances to which salmon become imprinted before emigrating to the ocean; salmon subsequently use this odor as a cue to identify their natal tributary upon their return from the sea; the soil and vegetation of each drainage basin impart a distinct odor to the water, providing the unique cue for homing; and formalizing the hypothesis in collaboration with one of his students, Warren Wisby, in 1951 (Hasler and Scholz 1983, 12).

Imagine a political scientist saying to a tough critic: "I got this great idea!" "Yeah, how did you get that?" "I smelled a mountain breeze and it reminded me of my childhood." This excursus on "method" is to make one observation stand in bold relief. The triumph of "the field of method," as Merriam called it, has the effect of suppressing much inquiry that cannot be conducted in the forms of the most advanced quantification/mathematics. From the point of a science of politics this is counterproductive. The competence of political science is diminished if emergent political scientists increasingly are obstructed from working in simple ways—if they wish to attain the highest levels of respect—when the more advanced ways will never reach the purpose. The competence of political science is enhanced if young scholars are given greater latitude in the ways of "soft" research, from traditional theory and history to sheer thinking, all in the purpose of a stronger substantive purpose.

The strongest concentration of combining advanced methodology and substance probably is around political parties, elections, and public opinion. My guess, and it is a guess, is that the next area of concentration is "legislation," which in contemporary political science can refer to committee politics, floor politics, and congressional voting (if not otherwise characterized as floor politics). In a sense, this area analyzes politics as the production and use of information (Ferejohn and Kuklinski 1990), with some attention to money (although not much explicitly). It is about democracy as a going concern, in which most people participate at a fairly low level of intensity. There are very well-regarded studies of this type, such as the widely cited work by Lupia and McCubbins (1998).

Elections are very important to the arrangement of

power, at least in some societies and countries. But the election is not itself mainly an exercise of power. There are exercises of power in strategic and tactical decisions that will structure who gets to run for office. But in free countries these are chiefly nonelectoral and preelectoral decisions. Elections themselves are not exercises of power, except that they give the command to someone to "get out of office." Nor are they usually conceived as such by the voters. They are, as exercises of power, spasmodic at best. When the command to "get out of office" is ignored or resisted, it can be enforced only by various nonelectoral pressures (such as when powerful groups indicate that they will not cooperate with the resisters) or, ultimately, when "the popular will" is manifest by boycotts, protests, or more strenuous action.10 If I reason correctly, then the part of political science where quantitative/mathematical advance is most to be celebrated often leaves our understanding of the exercise of power relatively unaffected. It also leaves relatively unaffected the most disruptive factors in the parameters of politics, and quite often the products of politics (policy).

BIG ISSUES IN "CONVENTIONAL" FIELDS

What should follow if most of the substantive part of the Merriam program were taken into serious account in planning a research agenda on a large scale? The choices would concentrate on inquiries into the organization and exercise of power. In the near to middle term (five to ten years) there should be an intense concentration on both establishing the "fact-content" as well as developing the "principles and conclusions," which would mean a full review of all the areas mentioned and their logical and strategic interrelations. The ultimate objective would be, as the economist Alfred Marshall ([1890] 1997, xi) said of his own book, "an attempt to present a modern version of old doctrines with the aid of the new work, and with reference to the new problems of our own age." Ultimately, that means a coherent summation of the findings of empirical research and their integration across the fields of the discipline. This is notably important, as the fields themselves (American, Comparative, etc.) are more conventional social organizations-organizational subrealms, so to speak-than they are intellectually coherent units.11

My point of departure is a concern for power. Four

¹⁰ This kind of action was reported in the media regarding Indonesia in October 1999. In due course, some scholar presumably will discuss whether this is a correct interpretation of that situation.

¹¹ It also means a clear conception, clearly argued, as to what part of our present empirical and conceptual core should now be abandoned because it is not grounded in the product of the most advanced quantitative/mathematical inquiry. Conversely, it entails the clearest attention to the theoretical significance of the adaptations that have occurred, including a clear summation as to whether they are producing empirically correct results that are more than a numeralized form of contemporary institutional history. I am contemplating a matrix with the major methodological innovations and techniques on one axis and substantive fields of work on the other. This may be impractical, although I do not see why it should be more than tedious. Collegial comment would be welcome.

sets of problems are strategic within this context: public administration, the nature of political interests, the politics of urbanization, and the interpenetration of politics and economics. They would permit, and sometimes require, linkages across the existing fields.

The Centrality of Administration

If students of politics, in this country and around the world, wish to observe power in action, then the crucial focus is discretion regarding the actual use of information, money or its surrogates, and force. These are the resources necessary to induce joint action, and they are found in every society. Their use is what I mean by the centrality of administration to power. Inverting Long's (1962) insight, administration is the lifeblood of power. This is not the "public administration" of a merely technical logic. The issue is still relevant to many governments in the world, including some at the subnational level in the United States. From the point of view of the organization of control, one can develop a much deeper agenda of research.12 Within "public administration," four matters appear to me of fundamental importance: the mechanisms of power, public opinion and public administration, public administration and the plural society, and the politics of prosecu-

Three Mechanisms of Power. The expectation is that if one takes all the units in the world called "nation-states," one will discover two mechanisms of power, and in some societies a third.

Mechanism 1 is the structure for giving and receiving executive direction at very high levels. We may think of it as aggregating data that will motivate authorities at the highest level, allow them to engage in decision making, and announce, declare, or proclaim their decisions. This structure is triangular. There is a central or chief executive: president, king, prince, pope, prime minister, and so on. There is an "entourage" (which more conventional political science language used to call "staff"), a network of "friends and cronies," "young servants," and "migratory technocrats" floating around the chief executive. ¹³ The third part of this structure consists of operating entities in the giving and receiving

12 This can be said if there is effective public government. I note that there is great discussion today of "privatization" and a "New Public Management." The resonance of this language was made clearer to me in a conversation with R. A. W. Rhodes at the meeting of the Political Studies Association of the United Kingdom in March 1999. My thesis, however, is that privatization does nothing to alter the basic pattern except one of two things. (1) It reduces the scope of public government, and in that event transfers power to the corporation or some nonprofit form of private government. (2) It keeps the scope of public government in form, maintaining the form of policymaking at the highest level, and delegated, assigned, or contracted program decisions and operational detail decision to some private entity. I benefited from separate discussions of the same general subject with Lawrence Howard, who, given his values and epistemological assumptions, expressed discouragement, and with Michael B. Preston, who merely treated the issue clinically.

¹³ This formulation turns out to be convergent with studies of high level executive decision making being conducted by a group of psychiatrists (Volkan et al. 1998, 160-1).

of executive direction. In the United States, the presidency (in which the president is the center but not the totality) is mechanism 1, but every nation-state has a mechanism 1, as does every state (and most local governments of any size).

Within this mechanism is a simple process that I designate as "bargaining and command." Presidents (or the chief executives in other systems) have a common feature. They are human beings with biological and psychological demands upon them, just as other human beings are. They operate with conceptions of free choice (authority and power to do whatever they think right), but they are also subject to organizational demand from the aggregate of subordinates about what is wise and right. They are also subject to demands from the world outside official government.

Delegation, formal and informal, acknowledged and unacknowledged, enters into the decision-making process. Between chief executives and official subordinates there is a continuous and simultaneous process of bargaining and command. This is not a research finding but a synthetic statement based upon what we know (or at least what I know) from the written record. Research can be planned and executed to elaborate and test the formulation against any political system in the world for which there is any chance of obtaining data. There is likely to be some variation based upon culture, legal authority, and so forth. The president of Finland has more power within Finnish government than the president of the United States has within American government, but neither can be wholly exempt from the generalization. The formulation is also testable against the transactions between the president of the United States, the presidential entourage, and the operating agency heads (secretaries and others) from 1789 to

I make two disclaimers and a bold claim. Disclaimer 1: I know little, if anything, more of President Clinton than does any other member of our discipline, and so far as I know, he has no reason to know my name. Disclaimer 2: I know even less of George Stephanopoulos. Claim: I know George Stephanopoulos and knew him before President Clinton knew him. This is not extrasensory perception or second sight. Stephanopoulos fits my model as the ambitious young servant. This conclusion stands solely on the evidence of his own published work and the known public record (Stephanopoulos 1999).

Mechanism 1 embodies, among other things, the fact of intercollective (interagency/"bureaucratic") politics, which is remarkably widespread. What makes mechanism 1 attractive, moreover, is that I can hope for intertemporal, international comparisons. For example, it can be applied to the Roman empire, for the period described in Fergus Millar's (1992) wonderful account of the emperor as a working official, not a movie character. Similarly, from the work of Conyers Read (1960, 1961), Sir John Neale (1953), and others, it can be applied to government under Elizabeth I.

Mechanism 1 sometimes involves democracy, but not necessarily. The extreme case is Nazi Germany,

whose propaganda systems surely were the antithesis of democracy. Yet, the competing propaganda organizations reportedly fought among themselves during the war, and Hitler—der Fuhrer, remember!—was reluctant to intervene and avoided seeing the combatant agency chiefs when he could.

Mechanism 2, considered generically, meets the problem of field administration. Again, the potentiality for systematic comparison is enormous. One cannot conceive a world without field administration any more than one can conceive a world without some system for food distribution. If central decision makers could dispose of these resources perfectly, then central control should always result. Those who are granted authority in the field are presumed to act upon decision premises adopted by central decision makers. Max Weber's model of bureaucracy fits what people came to believe, at any rate.

All over the world, however, we encounter observations that tell us there is a fruitful potentiality in the study of imperfect hierarchy. Terminology is not well established for administrative practices that do not accord with the pure model of central control. The terminology that I adopt here to express some vertical stratification, but imperfect degrees of hierarchy, is "devolution" and "negotiated power-sharing." Imperfect hierarchy sometimes is precisely displayed where the theory of hierarchy is most explicit. Imperfect hierarchy is obvious but has not always been accepted into theories of administration, although in the past decade and a half American scholars concerned with implementation have rediscovered, and to some extent reemphasized, "nonhierarchical decision making" (Levin and Ferman 1985). But as political scientists we may encourage students to look more broadly, for the imperfection of hierarchy is more pervasive, in many other polities.

The actions of those who are supposed to be subordinates may deviate from what central decision makers would have preferred for at least five reasons: (1) subordinates lack the physical or mental ability to perform what the central decision maker would require; (2) field-level decision makers have been given a bigger job than they can possibly handle; (3) the field administrator is protecting his or her own self-interest, in the narrowest sense; (4) field administrators do not agree with what they have been told to do and implement the orders in ways that are more satisfactory by their own lights; and (5) field administrators feel driven to modify, or reinterpret, their orders or compliance procedures, in accord with the local environment, so as to attract support from people who will not, in their opinion, comply with the orders as initially issued.

Devolution is essentially a bargain between the most central decision maker and the principal field subordinates, who by law, fiction, or custom are allowed dependent positions of rulership. It also involves the willingness and ability of the superior to intervene, punish, and even replace the subordinate official who does not toe the line, or who becomes ineffective. The bargain that is entered provides the benefits of office and the protection of the superior authority in ex-

change for the field ruler's willingness and ability to execute the controls, practices, and policies that the central authority desires.

Negotiated power-sharing (or what is called "intergovernmental relations" [IGR] in the United States) arises when the "superior" level of government has some incentive to offer for a means of action other than compulsion but is not willing to let the subordinate unit have completely free rein. It must mitigate demands it might otherwise then make. More than three decades ago, Michael Lipsky (1982) offered the concept of street-level bureaucracy to describe the transactions between the Nth official in the authority structure and the outside persons with whom an official entity deals.

Practice at this level reveals social realities, even to a degree that those who articulate social doctrine may wish to deny. What is to be said of rights when a police officer can, within station precincts, not merely beat a prisoner but jab a stick into the prisoner's anus?¹⁴ What of Waco?¹⁵

Austin Ranney once observed that most people "almost never see anyone or have dealings with anyone other than 'administrators.' "¹⁶ The "social constitution" is manifested in the daily transactions between those who exercise administrative discretion and those with whom they deal.

Mechanism 3 exists in some polities but not others. It is the optional institutions and processes through which constraints are imposed upon administration. Constraint is limitation, but it is also imperative direction. The distinction between "constitutional" or "democratic" governmental systems, as we now use those terms, and others is whether there are mechanisms for effective constraints. Collective bodies (legislatures or assemblies) are the principal constraining institutions, but adjudicative bodies (courts) also provide means for this end result.

In the American case, at the national level, constraint is notably present in the congressional process. Conceptually, there are four types of transactions between Congress and the executive branch: (1) for the purpose of achieving some legislation; (2) for the purpose of helping constituents ("intermediation"); (3) for the purpose of "oversight" in the more technical sense of getting better administrative performance or service; and (4) for the infliction of pain upon some executive, some set of executive subordinates, or others (regardless of whether the body has any constitutional authority to inflict pain).

The peculiar power of the U.S. Congress, incomparably the most powerful collective body in the world, is directly related to its deep engagement, through vari-

¹⁴ This refers to a New York City police matter in 1999 which is now in the public reports and on which I have not carried out a detailed analysis.

¹⁵ Various allegations have been made about the conduct of federal field agents in the Branch Davidian matter in 1993. The case had yielded, by the time of writing, much senatorial criticism of Attorney General Janet Reno, much reported (but not verified) conflict between the attorney general and the Federal Bureau of Investigation, and the appointment as special counsel of former U.S. senator John Danforth.

¹⁶ Letter to the author, March 25, 1969.

ous constraint procedures, in the administrative process. Congressional investigation is a means by which Congress exercises particular influence upon the administrative process. Upon close review, it appears that at the moment there is no collective judgment among students of the legislative process about this form of congressional power.

There is a small residue of lost knowledge on the congressional investigative power, since Marshall Dimock (1929) wrote a pioneering study near the time of Teapot Dome. Dimock and two other political scientists from prior to World War II wrote books that are "lost" in the sense that no one reads them much now (Dimock 1929; Eberling 1928; McGeary 1940). In the twentieth century, the number of investigations has, presumably, been vast. I have seen no specific accounting. Nelson McGeary's (1940, 9) study, about a dozen vears after Dimock's book came out, reported 146 investigations in a ten-year period. Some material is available to us in three encyclopedia articles (Johnson 1995; Relyea 1995; Tiefer 1995); a very informative account by a participant-observer of the work of the Church Committee, a Senate committee that investigated the Central Intelligence Agency during and immediately after the Nixon administration (Johnson 1988); and one synoptic review of high publicity investigations since World War II (Mayhew 1991).

There is considerable opportunity to regain lost knowledge and to extend discovery by a deeper search into how the congressional investigation has developed and changed in the United States¹⁷ as well as a great opportunity and need for further inquiry. The question of what functions investigation now serves or accomplishes, and of what the functional equivalents are in other political systems are extremely important. Here is a momentous opportunity for some energetic scholar.

Public Opinion and Public Administration. The second area I find particularly compelling is public administration and public opinion. If public opinion is fundamental, then we should expect its manifestations in all the processes of politics (adjudication, legislation, administration). Let me offer a set of reasoned conjectures.

¹⁷ I reach this conclusion after extensive review of electronic search sources, notably J-STOR, Social Science Abstracts, and Public Affairs Information Service. In particular, in July 1999, I reviewed J-STOR for all articles on "congressional investigation" published from 1940 through 1999 in journals in political science, history, economics, and sociology. That relatively broad search yielded a total of 89 articles for the sixty-year period, in the four disciplines. Dissertation Abstracts (1983–99) shows 116 entries. Most of these entries have nothing to do with congressional investigation, but come up as artifacts of the indexing system. If they mentioned either congressional or investigation, the system identified them. My supposition has been, however, that there must be other research of which I am unaware. Accordingly, I consulted some half dozen leading scholars in congressional studies and generally found agreement that my search had about exhausted the actual material.

¹⁸ Beryl Radm (personal communication) points out that this is now very important to American public administrators, shell-shocked by other political attacks. Radm also notes ambiguities in the definition of public opinion. Patrick J. Wolf (personal communication) offers other useful comments, including the normative challenge as to whether public opinion should play a role inside administration. I

First, there is a coercive quality to public opinion. It imposes demands and prohibitions on and expresses tolerances for various actions and results. Public opinion tends, when issues are taken seriously, to a form in which debate produces great anger; side A speaks as if it wished to destroy side B. If both sides are serious, then we should expect an agency to suffer considerable pain if it chooses a decision preferred by one side, but it may be under great pressure to do exactly that. Charles McCarthy (1912, 180), writing about Wisconsin state government, stated that public sentiment might force regulatory commissions to deal perhaps harshly with regulated companies, but ultimately the companies would be protected by the courts.

Second, the power of culture over opinion is that culture underlies opinion, at least the sort of opinion that is normally measured (and perhaps the sort that is measurable). The significance of such cultural values is frequently ignored by students of administration as well as by students of public opinion. Perhaps in the rapidly emerging techniques of research there are much better instruments than poll data. But I have asserted—and not yet tested—that poll data are similar to the surface froth at the ocean known as whitecaps; what truly is important for the continuing public administrator are the beliefs and feelings more analogous to deep ocean currents.

Third, the variety of means for introducing public opinion into the administrative process is very wide: the actions of collective bodies (legislatures or otherwise), common gossip and other means of cultural communication, extralegal and illegal actions, interest groups, legal processes such as hearings and complaint procedures, opinion surveys (Key 1961), and so on.

Fourth, administrative agencies purposely act to influence opinion, which one recent private commentator noted on the draft of a cognate paper as "political entrepreneurialism." The various activities intended to produce opinion amount to public relations or propaganda (in both the narrowest and the broadest senses); the reinterpretation of any given proposal to presumptive larger policy; the reinterpretation of data to fit new circumstances; the cooperation with external organizations on favorable terms; and, on the controlling side, censorship and information control (leaking as a form of control) as well as pejorative rhetoric.

Public Administration and the Plural Society. Most states, for most of human history, have been multiethnic, not homogeneous. This is true even for Western Europe. Therefore, administrators (who have the capacity to make decisions about the definition, collection, dissemination, and use of information) will act in situations such that their purposes, interactions, and consequences will be varied as to ethnic effect. Accordingly, their actions will be varied as to consequences for political stability, change, and viability.

The Politics of Prosecution. In the terms of Merriam's (1926) agenda, prosecution is a variant on constitu-

similarly acknowledge helpful written comment by Paul Freedman and face-to-face comment by Christopher Wlezien.

tional law. The potential for convergence in the politics of prosecution of American politics, public administration, comparative politics, and international politics lies in the parameters, forms of action, and products and consequences of action by government lawyers (in the American case) against other persons.

The prosecutorial function represents great intellectual opportunity. The power of someone or some institution (1) to make some person or institution (2) present itself before some entity (3) upon some pain for failing to do so is crucial. The prosecutor applies controlled and subdued force, exercised through the forms of law, to threaten the loss of freedom, secure that loss, take away money by requiring one to spend for defense, deprive one of peace of mind and quiet sleep, and ruin good reputation. While all the powers of the prosecutor are important, the prosecutor, more than any other, is the official with the power and authority to inflict a scandal by the mere circulation of information that action is being considered.

Prosecution depends upon the collective reaction to the intersection of an act deemed an offense (since there can be no crime without a prior law), the party by whom the act is committed (the offender), the party against whom the act is committed (the victim), and the rest of the collectivity. The question is whether the rest of the collectivity thinks this intersection demands reward, penalty, or neutrality.

The more factionalism increases, the more prosecution will be a part of the struggle. For example, the discussion of abolishing black slavery became, in the 1830s, truly subversive. White people who opposed immediate emancipation held up the fear that a vast black population, out of control, would wage war against the former masters. Whites identified as abolitionists became the objects of control and suppression by those who favored slavery or even those who said they favored "colonization." The issue was not black freedom but the suppression of white debate. Prosecution could play a part. In one account I have seen, a colonizationist district attorney was intent on making a case against an abolitionist and the dangers of immediate emancipation. 19

I invite consideration of this issue from the students of comparative politics, who must have relevant evidence from a number of countries, particularly Italy and Korea, where heads of government or heads of state have been prosecuted in the context of severe domestic political controversy. Prosecution becomes, of course, irrelevant when the forms of political conflict depart from the symbolism of words and the forms of law. At that point, politics returns to its elemental form as force.

Public administration as restated here—in terms of mechanisms, public opinion, ethnic plurality, and prosecution—is emphasized as a logical, essential, central component of reframing a science of politics. I now

turn to another element of the political underpinning encompassed by Merriam's "Progress in Political Research," namely, his truncated suggestion about the nature of political interests.

The Nature of Political Interests

What Merriam meant by "the nature of political interests" is not fully explained. But the analysis of interest groups virtually always assumes the "interest" and focuses on the "group." Under Truman's (1951) adaptation of Arthur Bentley (1908), the interest group is inherent in all politics. At one level of thinking, I believe it would be useful to distill the major concepts, propositions, or implicit theory in Truman's book, separated from his data, which necessarily are time bound. The essentials then could be reviewed point by point in light of studies and specific findings that relate to them.

Baumgartner and Leech (1996, 523) offer a useful heuristic contribution. They critique an article that claims "to refute a prevailing wisdom that groups lobby legislators who already support them [and] conclude that groups tend to lobby those who oppose them, and lobby their supporters primarily to counteract lobbying by other groups." Their methods critique is impressive on its face.²⁰

There is a need at this stage in the collective research life of political scientists for a systematic comparison of the literature over several decades. Truman's (1951, chaps. 1–4) examination of groups starts with the role of groups in society and the circumstances of their activity in governing, and he drew heavily from social psychology and applied social anthropology. Broadly, he examined group organization and problems of leadership (the internal dynamics and cohesion of groups), their relations to government, and their tactics of influence (in different institutions), and he concludes with a view of group politics and representative democracy.

What of "interest" itself? In the deepest inquiry, we seek to identify the variables that will motivate political action before it occurs. In this respect, we should be looking for the driving forces of political action. Imagine that one is a consultant in Lagos, Nigeria. What should one look for in order to anticipate what the local authorities will do? One does not have sufficient knowledge if one has to depend on a catalog of existing groups.

Whether the presence of interest groups has the consequences that Lowi (1969) attributes and whether there is a possible adjustment are very important problems. But is interest truly so fundamental? Madison proposed that interest is universal, grounded in "human nature." If so, then there is a problem in discovering interest expression in a polity that does not even purport to be democratic. Most research is about

¹⁹ See Filler 1963, 75, n. 61; Goodell 1852, 437–8, which also cites Crandall 1836, 46. Filler also refers to Delaplaine 1937, 308. The trial, acquittal, self-exile, and death of Reuben Crandall are briefly described in Strane 1990.

²⁰ Indeed, though I discovered this article very late in revisions on my address, using J-STOR, I am surprised not to have found a response by the authors they critiqued. Perhaps it exists in some form other than an article (e.g., a letter) that would not have been identified by the search mode I used, i.e., asking for "articles."

the United States, then about the United Kingdom, and then about various forms of action in the advanced industrial countries since World War II.

Interest groups are largely conceived as "economic," although neither Bentley nor Truman accepts this limitation. Hirschman (1977), however, discusses the arguments for "interest" as economic factors, more suitable to regimes than less rational passions or more emotional or extrarational behavior.

The Politics of Urbanization

I regard the politics of urbanization as one of the strategic areas that may now span the fields of American Politics and Comparative Politics. But this point should be placed against the specific background of Merriam's address. Merriam argued that there has been great progress in the study of the problem of the modern city, progress related principally to the establishment of research entities that provided data to improve urban government. At the end of the twentieth century, students should recall what American cities were like at its beginning. Essentially, the city was a receptacle into which vast numbers of human beings poured rapidly from all over the world. The governance of the city was affected by the need to reconcile these multiple populations to each other. The governance was largely directed by the urban rich who controlled the economy (Almond 1998) and by the urban bosses who controlled the cities (Gosnell 1937; Gottfried 1962; McKean 1940; Zink 1930) and treated them as their own business enterprises. Students should know the practices of local politics. It may be "colorful" to tell stories of people who got jobs on the public payroll because they were diligent party workers. But those jobs were not free, waiting to be taken. They meant that others on the public payroll had to be fired, in a world where "equilibrium" included a good deal of unemployment.21 Merriam, the theorist turned politician, was with the reformers (Karl 1974). He thus could cite the work of Leonard D. White in developing the study of public administration—chiefly the study of personnel, which White raised to an art form—as an alternative to absolute patronage politics. Merriam thus celebrated the rise of research institutions that provided data and arguments to support reform of city government, in the attempt to overcome the use of the city as a place for the boss to get rich.

From the 1930s into the 1960s, for a variety of reasons, urban politics was not a growth field in political science (Herson 1957). Its revival in the 1950s with a vast amount of research on urban politics (Banfield 1960; Sayre and Kaufman 1960), metropolitan areas (Wood 1964), and notably on the "community power" themes (Dahl 1962; Hunter 1953; Long 1962) can easily be retraced by those who wish. These themes are revisited by Clarence Stone (1989) and those who are persuaded of his approach to "urban regimes." There are, in my estimation, three main threads in the political science that deals with the problems of the modern city: the city as the miniature polity, the city as local government, and the city as a manifestation of the process of urbanization. The last offers the important intellectual opportunity at this stage of the discipline.

Urbanization is important now for three reasons. First, it simply expresses the increase in scale, with the issues about participation as scale goes up (Dahl 1967, 953-70). That would be important itself. But, second, urbanization also yields a version of the Hobbesian problem of making and maintaining commonwealths because it means the drawing into one territorial area, over which control has to be exercised, multiple populations from diverse geographical, cultural, and ethnic settings. In other words, human population is not only more dense, but the multiple social systems are more closely packed together. It is likely that this becomes a more and more compelling human problem as the part of the world that is not rich becomes urbanized. Third, the politics of urbanization is qualitatively different because the very fact of urbanization produces a major shift in our relationship to the physical environment, and thus produces qualitatively different problems of conflict and decision making. Urbanization and the environmental problem are not identical, but they are intimately related.

The Interpenetration of Politics and Economics

In discussing a variety of big public problems, Merriam (1926, 8) maintained that "neither the facts and technique of economics alone, nor of politics alone, nor of history alone, are adequate to their analysis and interpretation." The issue that I raise is the interpretation of politics through contemporary neoclassical theory.²² Coase (1988) refers explicitly to "the economic theory of politics," and Williamson (1996, 251–2) refers to "the use of economic reasoning to examine politics and

²¹ Colleagues will have to endure one anecdote that I deem relevant. Somewhere around the time of the Truman administration, when the old system still existed but was collapsing, I assisted the precinct captain in the 115th Precinct of the 2d Ward Regular Democratic Organization. One resident on our block, Mrs. Walker, lived with her grandchildren and son-in-law, and she was a vigorous, outspoken, Republican. My precinct captain (Albert Grimes) was unhappy with her, though there was no chance the precinct would turn Republican. "We ought to be able to do something about her," he said. "Her son-in-law works for the city, doesn't he?" The son-in-law was a driver on the Chicago Transit Authority. Under the conditions that then existed, however, nothing seems ever to have happened, but Mr. Grimes's presumption was that something could happen and that it would have been legitimate for him to have gotten the Ward Committeeman to take the necessary action.

²² I merely note but do not analyze here the controversy between missionaries of "rational choice" (Green and Shapiro 1995) and dedicated opponents of "rational choice" (Priedman 1996). It is important, but I cannot treat it here, and I hope to get to it at some other time and place. It is rather similar to the controversy between "behavioralists" and "institutionalists" in the later 1950s and 1960s, in that the dispute is confused and exaggerated. People say very similar things to praise their fellow believers and to criticize those who do not believe. It is expected to have considerable consequence for individuals and their futures. Finally, much of what is said has little to do with the exercise of power. Perhaps I may change my mind upon further study.

political institutions." Political relationships can be stated and reasoned about using economics terminology. That which is absolutely fresh is, of course, a net advantage to all, if it is actually knowledge.

Perhaps we might call this approach the Neoclassical Economic Politics (NEP). Some colleagues of extraordinary talent and achievement may not believe there is knowledge that remains independent of adopting economics per se as our guidepost (Alt and Shepsle 1990). I am respectfully skeptical. On the one hand, it is right that we learn more about economic concepts and the practical workings of the market system. On the other hand, I think it is absolutely wrong to set political science students adrift upon the neoclassical sea with no compass. The first objection is that neoclassical economics, which is now being imported as a source of guidance on politics, is grounded in the most extraordinary political innocence.

James Buchanan (1992) provides the evidence for this innocence. At the technical level, he was a student of public finance. His work was influenced by certain Italian economists, he says, because they "routinely modeled political decision structures as part of their work" (pp. 82–4). The sentence comes from his autobiography,²³ but the Italian influence can be found in some of his writing on public finance (Buchanan 1987, chap. 10, esp. 128–9). Buchanan expressly separates himself from the U.S. tradition that treated government as a "monolithic and benevolent" actor. If that is what English-speaking economists taught their students, then they could have abandoned it a long time ago.

Economists, at least in America, have ignored political knowledge that could have been theirs. That is, they have simply rejected the institutionalism of such economists as John Maurice Clark (1957). Williamson (1996, n. 2), a leading figure in the new institutional restatement, has the following mild comment in a footnote about a view expressed by Coase: "Some concluded, too harshly I think, that the work of American institutionalists led to nothing . . . [since] without a theory, they had nothing to pass on." In other words, Williamson thinks there is some intellectual value to the institutionalist residue. In short, economists had another intellectual structure to protect, and they could not protect it if they allowed politics to enter their considerations.²⁴

All they needed to escape that blind spot was interest group politics. The only reasonable inference is that economists as a group made a collective professional decision not to learn interest group politics. People have known about interest group politics in a general way for a long time. Merriam targeted it as a potential research topic in the 1925 address. Childs (1930) and Herring (1929) published relevant work in the 1920s. Schattschneider (1935) wrote on the issue at the beginning of the 1930s, using an economic subject, the tariff,

as his source of material. Truman produced his masterful synthesis in 1951,²⁵ of which there have been many criticisms, but for which there is yet no intellectual replacement incorporating research over the past two decades.

The second difficulty is that there are aspects of economics that economists seem no longer to need to know, but these are important to students of politics. There is no reason to start with economists' concepts per se, especially as it has so often proved necessary to modify them in order to adapt them to observed politics. The adoption of economists' concepts may well be analogous to merging with a firm that is constantly restating its assets. Economists may have no need to reexamine the role of poverty in the thinking of Alfred Marshall, the history of the fight between abstract theorists and institutionalists in the United States, the long struggle between the followers of John Maynard Keynes and the followers of the Austrians and Lionel Robbins. Since the history of economic thought is disappearing from curricula, economists themselves will soon be of no value on those issues. But political scientists who absorb economics as their guidepost have such a need.

Political scientists have the capacity to contribute to broader human understanding. Their proper premise is the interpenetration of politics and economics and, in some respects, the primacy of politics over economics. The competence of political science should be enhanced and carried to a political science of industrial organization. I do not mean that nothing else is relevant, for that is shallow in the extreme. I do mean that the political scientist who starts from political science concepts will make a contribution and will discover other things of relevance. Three areas of inquiry seem reasonable: the corporation, industry sectors, and the larger arena.

Corporate Governance. Opportunities for inquiry about the interpenetration of economics and politics abound in the subject of corporate governance. This is not a new idea. It is expressed in Drucker's (1978, 262–3) writing during World War II, although Drucker believes it hurt him academically. It is expressed in a different manner in the behavioral theory of the firm, as set forth by Cyert and March (1963).

Here are some practical examples. Within the world of the American corporation, the chief executive officer (CEO) is well known. As an initial point, there would be great merit in study of the tenure and turnover of CEOs. Then there would be merit in the study of how CEOs operate, as we also have a professional interest in how public executives operate. The mythology of the CEO as absolute boss, within the limits of the law, is

²³ Buchanan cites, to this point, Viti de Marco 1936.

²⁴ My recollection is that one reason Aaron Wildavsky studied the budgetary process was his dissatisfaction with the budgetary writing of Arthur H. Smithies.

²⁵ When a Nobel Prize is created, at some remote point, for political science, Truman's *The Governmental Process* (1951) will deserve that prize. Admittedly, others would make other choices. Florina (1996, 91) speculated on the idea of Mancur Olson as such a designee. I assume Fiorina was thinking of Olson as the economist that he was. It is ironic that Olson should receive so much attention for a book that is chiefly a contribution in political science and one that is both brilliant and dubious at the same time.

everywhere. Moreover, there is a tendency for CEOs to become increasingly self-assured as they continue in office. This sometimes yields conflicts with boards or directors and, at other times, may lead boards to be acquiescent. But where is the norm in practice? (See Newman 1996.) If one adopts the "bargaining and command" model from the public sector, what would the significant differences be?²⁶

One would expect (predict) the CEO function to be affected by changes in the technological, demographic, and cultural environment of the firm. Technology arguably is a factor altering the role. The greater reliance on information technology creates another seat at some corporate executive committees for a chief information officer (CIO), but I do not know exactly how that works. Nor does anyone else.

Legal requirements, accounting requirements, and investor expectations affect the relationship of the CEO to the chief financial officer (CFO). The CEO function should be somewhat restricted, one would predict, by the growing demand by others in the investment world for better information on finances and internal management. This demand, in turn, leads to an additional demand that the CEO accept an independent audit committee in the board of directors. The audit committee chair is the only person with authority to ask questions directly of any corporate officer, without the clearance of the CEO. Indeed, in the United States, the chair might be legally liable if s/he sought such clearance. Different legal environments in some other countries, such as the United Kingdom, would also be relevant.

Industry-Level Relationships. An industry is not only a set of "economic" transactions but also a functioning political system in which people have ongoing relationships (Hamilton 1957, 6). When a large manufacturer is short of the product that the market demands, it can ration by price, or it can tell steady customers that it will deliver to each some proportion ("allocation") of what was ordered until production increases. This procedure could easily be understood by anyone who deals with the normal realms of politics.

In economic organization, one political dimension is the constant tendency toward oligopoly at the industry level, the manner in which some firms acquire chokeholds by dominating some segment of the industry (such as smelting in the copper industry). The financial community is a notable place for such examination, and we could have some evaluation of which firms provide leadership in the financial community to a greater degree than others and the structuring of syndicates (other than the objectively measurable considerations and alliance patterns within the financial community). Those who raise money, those who certify value, and those who attest to legal validity surely are involved in some dynamic political exchange.

The Larger Arena. There are, of course, questions of public politics and public policy as well as their effects on the internal governance of the corporation. Such rules are interpreted and changed, in the functioning market economy, to protect or advance "high-risk" projects that the pure free market would never sustain. Three examples are the civilian nuclear power program, the proposed Alaska Natural Gas Transportation System, and the synthetic fuels program, all adopted by Congress during the second half of the Carter administration.

Geoffrey Miller (1998), a lawyer, recently published an article in a corporate governance volume sponsored by the Sloan Foundation. The abstract states that it is harder to carry out a takeover in the United States than in the United Kingdom for two reasons. First, there is more room for antitakeover forces in state governments, whereas the centralized U.K. system squeezes those people out. Second, legal doctrine in the United States allows lawyers to make money out of takeovers, and thus "creates a strong interest group within the organized bar" (p. 629).

There is opportunity, and need, for inquiry into the politics of creating and sustaining different kinds of markets. Markets cannot exist without a definition of "mine and thine" and of the conditions under which "thine" becomes "mine." Such rules, if not derived from sheer tradition, come by application of reason, but some are ultimately products of power. Markets, except in the most primitive sense, exist not in nature but in the rules (which is to say political choices) that human beings establish (Douglas 1962, 211–33).

What may be even more fundamental is the political conditions under which rules are changed to facilitate free markets. There still remains the important issue of how, in the political sense, the market system is created or sustained. How do we explain changes that create markets more favorable to "economically correct" results, since such changes necessarily impose at least short-term penalties upon many people?²⁷

The transformation of England from a rigidly regulated market at the time of Adam Smith to a more or less free market seventy years later, at the time of Corn Laws repeal, warrants study. So does the problem of land ownership in a country such as Nigeria, where individual title is not the norm. Suffice it to say that a host of questions—including creation of new categories of gainers and of losers—can be asked about in the former socialist countries. Perhaps something of this kind is occurring in American debates over the restructuring of the electric power industry (Holden 1995).

These four sets of problems—public administration, the nature of interests, the politics of urbanization, and the interpenetration of politics and economics—refer to substantive matters where the exercise of power is displayed. The methodologies that are appropriate may be "hard" or "soft," but these are matters with which young scholars should be concerned as they

²⁶ Cyrus H. Holley, with whom I served on a corporate board for several years, read an article on this subject and said: "Oh, yes, I could apply that in my own company."

²⁷ This general concept now takes operational reality in the experience of the former Soviet Union.

pursue their calling. We seek to enhance competence (capability) in order to achieve and maintain competence (domain).

UNORTHODOX AREAS

In the creation and maintenance of competence, we may, and I believe should, teach the need for coherence and direction, for strategic inquiry into the "unorthodox" portion of Merriam's formulation. These are all matters that, as students of power, we might fit into a coherent whole, and they are all matters that the young might be facilitated to study. But here I offer only a brief thought on force, passive resistance, and noncooperation.

As to where we should place high priority, I restate the view that politics is not merely a debate or a game, it is often a fight. From a moral point of view, the game is preferable to the debate, and the debate preferable to the fight, assuming the participants are on some equality with one another. From what we can observe and what has been recorded, however, that is far from the normal situation. This should be set against the concept of information as a political resource. Insofar as politics can be mainly a game, or possibly even a debate, there is great value in information. Existing and emerging empirical democratic theory is focused on information as a political resource. But politics is not always a process of persuasion or bargaining but of coercion (Pennock and Chapman 1972). I say nothing here of passive resistance, having given it too little thought. There may be colleagues who would prefer, on scientific or moral grounds, to begin with passive resistance and noncooperation rather than force. Force was where Merriam began, although he was aware of Gandhi.

THE OXENSTIERNA-MULLINS EFFECT

When the term "decision making" became an important political science concept, we also began to talk about rationality. Perhaps we borrowed too much (Holden 1996), one evidence of "too much" being the persistent belief that synoptic rationality can and should govern decision making. Vertzberger (1998), in a study of military interventions, argues that this principle is still believed by decision analysts. He thinks it should be rejected, which is why he undertook the study. Vertzberger (p. 407) thus urges that people making decisions know "the nature of the information" they are provided and know whether disagreements in risk assessment are "embedded in different informational bases" or are "judgmental" (different interpretations of the same information). The argument is persuasive, but the solution that decision makers should be trained to do this seems far from realistic. Can the world be stabilized so that heads of government can undergo such training? Can anyone fulfill the requirements of the challenge specified?

The problem is serious, and we can see many disastrous decisions in all walks of life. In general, those who do not think synoptic rationality is real have chosen to

accept "bounded rationality," which basically says that our limited thinking ability is what hinders us. The bounded rationality idea is useful, but it breaks down at some point. It does not show what I have named the Oxenstierna-Mullins effect.

Axel Oxenstierna was chancellor of Sweden under Gustavus Adolphus, during the Thirty Years' War (1618–48) (Wedgewood 1961). On one occasion he wrote his son: "My son, my son, if you knew with what little wisdom the world is ruled" (Myrdal 1965, 20). Moon Mullins was not so elegiac but equally forceful: "Results is what you expects and consequences is what you gits."

People often expect results and get consequences by virtue of their own bad decisions and the dynamics those decisions produce. The enemies of Julius Caesar destroyed him, the republic, and many of themselves. The ruling elites of Germany, Austria, and Russia blindly moved their countries into World War I, not without calculation but without much detailed advance calculation. They were not merely displaced as rulers but destroyed as elites and sometimes as persons. The Japanese elite before Pearl Harbor trembled, as Masao Maruyama (1969, 89) wrote, "at the possibility of failure, [but] still thrust their way forward with their hands over their eyes." The result was imperfect rationality to the extent of pathology.

Force is a crucial element in both domestic and international politics. Crucial does not mean "good," necessarily. Force often leads to one aspect that nearly all social observers undervalue. Merriam (1926, 5) said "I have sometimes thought it would be worthwhile to write a history of political unreason, folly, and prejudice, in order to balance sundry discourses on political theory, and offset the possible conclusion from them that all political action is likely to follow the lines of thought indicated by the great masters of systematic political speculation." The use of force is one situation in which people frustrate the future they wish to create by failures or serious imperfections in rationality. Sometimes, they create situations of foolishness, selfdefeat, or pathology. The examples refer to very highlevel decision makers, but the Oxenstierna-Mullins effect applies to low situations. What rationality requires a police officer severely to beat a prisoner, already under arrest and inside the confines of the police station?

THE OUTSIDE WORLD

The competence of political science is enhanced to the degree that we can reach into the real world beyond the graduate seminar, the journal, and the university press book. When there is an important change, we should be altered.

Opportunity to engage the larger world always exists, and sometimes that opportunity may be unwanted. People often expect a political scientist to have some knowledge or competence about a variety of governmental relationships and problems, which Elinor Ostrom (1998) has called collective action problems. When we are unable to take into account those needs,

the social options go to others. Engagement in the world beyond the academy is often intellectually valuable and professionally compatible. Two fields of political science do make practice claims, namely, public administration and international relations. (Although some colleagues must work in a language that most practical decision makers cannot use, there is no reason to discourage other colleagues who aspire to speak in the language of practice.) David Newsom, the recent Cumming Professor of Diplomacy at the University of Virginia, is a constant advocate of the view that contemporary publications are generally too remote to be used by people who are engaged in foreign policy.28

Even when the language is standard English rather than mathematics, there is an additional impediment to understanding of those who write in scholarly terms. We cannot assume that the meaning of political science concepts will be obvious to practitioners. In part, this is just a question of semantics. The same word will often have different significance to scholars and to practitioners. But it is not just words. It will often happen that the problem perceived by one is invisible to the other and that the need for rapidity of decision will not seem the same to each. Political scientists may need at times to find some entry into the practice, for it is only in the world of practice that they will understand, and be understood by, practitioners. This is perhaps the same as the case that political scientists need to develop some equivalent of engineering, though that is an imprecise idea (Ordeshook 1996, 175-88, esp. 180-1 and 187-8; see also Dennison 1932).29

Participant and/or advisory roles offer entry for political science into some worlds of practice. We know of political theorists (such as Machiavelli and Locke) who have held political posts, whether minor or major. But we need not go so far back. The earliest American example I can cite is Francis Lieber, who had a background in international law and finally persuaded the Army to let him write about the international law of land warfare in the Civil War period. The result was General Orders 100, establishing conduct of armies in the field, which students of international law say has had wide influence elsewhere (Freidel 1947, 336-40; Nys 1947, 355–93).

The advisory role has been adopted by a large number of our colleagues in one form or another. In the local government setting, for instance, the Ameri-

can political scientist who has the inclination is sure to be invited to participate in something. From there, nature will take its course. I am not certain this is so in other countries.30 In most states, the flagship public university (and sometimes other public universities) has a research agency that conducts practical research on such questions as the incidence of taxation in the state, the organization of local government, the state legislative process, and other relatively practical matters. Political scientists, and other scholars, who work in these entities sometimes develop intense knowledge of the state government and themselves become major figures in state affairs. In general, a fairly severe separation operates, so that the work such colleagues do seldom flows back into the main body of intellectual discussion. The young political scientist can be at some professional peril due to outside engagement. One result is that young people who have strong interests outside the academy simply leave because they are unlikely to meet all the internal requirements for promotion and tenure.

The bad result, intellectually, is that their experience is not often fed back into the political science analytical process. It is intellectually counterproductive for external success to preclude feedback into the political science community. The rigidity in our collective decision rules means that other realms-management science, decision theory, schools of public affairs, schools of public administration, schools of international relations-preempt a good deal of the work that we might undertake. This rigidity is not ordained by nature. It is a function of how our organizational realm works. It is within our capacity to alter the rules and often a major intellectual (thinking) issue is contained in the practical issue. What is the explanatory theory in political science that will offer some useful guidance to realistic action? This is an idea that it is imperative to accept, if students and ambitious young scholars are to be free of the terror that "practicality" will render them "inferior." Tenure, salary, and prestige, as Ordeshook (1996, 188) rightly points out, cannot be withheld from people who allocate their time and energy to such work.

The last years of the twentieth century are not the first time we have faced this issue. Merriam's reference to "legislation" was not principally to studies of the combinations and adjustments in lobbying, committee fights, and floor fights. When he says that "significant advances were made by . . . McCarthy, whose untimely death caused irreparable injury" (Merriam 1926, 2), he is referring to Charles McCarthy, who founded the legislative research organization in Wisconsin.

McCarthy soon came into the initial group that called the meeting to create the American Political Science Association. Their interest in "comparative legislation" was in material on the form and content of legislation from one country to another, so that drafters and legislators could make use of them. This practical side of the creation of the American Political Science Association itself is lost knowledge now, but it

²⁸ Newsom was a career Foreign Service officer who retired at the level of Undersecretary of State. A similar complaint is expressed in a letter to the president and president-elect of the association by Dr. Lloyd Etheredge.

²⁹ Harold Guetzkow expressed such an idea in the 1950s when I was a graduate student, although I do not know whether he ever gave it formal published form.

³⁰ Anthony King has (in personal conversation) told me that this kind of engagement is less likely in the United Kingdom than in the United States. I am, however, aware that such a colleague as L.J.

Sharpe (Nuffield College) was a member of the Oxford City Council, although whether this is a function of the special importance of Oxford University in Oxford itself is a question. Moshe Shani, when my temporary colleague some years ago, said that such engagement was much more common in Israel, perhaps as a small country with intense demands for highly educated competence and a strong claim on the moral engagement of its people.

cannot have been lost in 1925. Most of the original participants were still active, although Merriam himself was a subsequent member. McCarthy's short professional career (twenty years at the outside) illustrates the remarkable confluence of chance, personality, and structural forces in society.³¹

Prior to World War I, the APSA was persuaded to create a Committee on Practical Training for Public Service (first called the Committee on Laboratory Methods in Political Science), chaired by McCarthy.³² McCarthy felt that any University of Wisconsin faculty member ought to be available to help the legislature at request. This was the German system, according to McCarthy. He preferred it. Moreover, Fitzpatrick (1944) said, there was one annual report of the American Political Science Association saying that a time of public service should be a prerequisite to a Ph.D. It is not surprising that idea was defeated.

Avoidance of public engagement may be warranted on the grounds that one's freedom will be compromised. One certainly cannot speak as freely if one knows something, for there will be occasions when discretion is necessary. There is almost nothing to be said for avoidance on the basis of developing or maintaining intellectual competence.³³

We have an opportunity to enter more seriously into the popular culture, but we have to want to do so. Political science is where thoughtful people go, once they can no longer depend on their own common sense and on political journalists. It is where political journalists themselves go for interpretation deeper than they can get from "inside" sources. Political science shares its domain (area of competence) with history, law, and philosophy, with sociology, psychology, and anthropology. It may be surrendering vast portions to economics, as it once surrendered a great deal of the field of administration to engineering, business, management science, and others.

Political science has to compete with common sense political theory communicated principally in the general culture. It is structured by education from kindergarten through the twelfth grade. There is also the political theory conveyed in mass media. Executives are trained in business school political theory, although it is generally not conceived as "political" and often is not described as "theory." It is both.

"Judicio-political theory [is] enunciated in law class rooms, law reviews, reformulated in lawyers' briefs, and authoritatively expressed in judicial decisions" (Holden 1996), but is in need of some challenge. That means the immediate frontier may be legal education. Political

immediate frontier may be legal education. Political

31 Charles McCarthy, a young man from Brockton, MA, had gotten
a Ph.D. in history from Wisconsin in 1907 (Fitzpatrick 1944).

32 Lowell (1910, 11) also speaks respectfully of "the bureau of legislation at Madison," but he seems to have thought of it as a

science already has, in its present content, a great deal to contribute to the education of lawyers, whose briefs will frame issues for judges, and of judges, who will decide the issues. The education of lawyers will be altered if law students and law professors debate political science.

Progress in political research also will call for some new thinking about interdisciplinarity. Merriam (1926, 8) was somewhat aware of that issue, as suggested by his list of basic problems, which would require combined efforts to resolve: "punishment and prevention of crime, alcoholism, the vexed question of human migration, the relations of the Negro, and a wide variety of agricultural and industrial problems." This would now be framed differently. Social scientists would likely speak of "the status of African Americans" or "the role of the blacks," or retreat to some other language about "color-blind" policies or "affirmative action," depending upon their ideological commitment. Little appears to be written on the assumption that the pattern of white-black transactions has any important connection to the viability of the United States as a political system. African Americans and European Americans, as groups, coexist as if they were two "nations" within one governmental authority. This calls for serious political analysis, not moral analysis (Holden 1999). The white-black relationship is not as intractable as that between the opposing sides in Northern Ireland, but it is far more so than most people appear to suppose. There is no more important social science problem, with ramifications for human societies around the world, than developing a more fundamental concept of how to create peace between large groups between whom there is a diffused hostility.

The National Science Foundation's (NSF) leader-ship has recently emphasized interdisciplinary research on major public problems. Political scientists might note, for instance, the term "biocomplexity," used by Dr. Rita Colwell, who believes "it will take biologists, computer scientists, engineers, and surely those in the behavioral sciences to understand the signals for survivability." She added that "no problems exist in isolation, whether they are scientific, social, or technical. More often, they are all three at once." NSF's Assistant Director for Social and Behavioral Sciences Bennett Bertenthal even spoke in public of a "Manhattan Project" approach to major problems and urged the social sciences to prepare to take a role so that they would not be overrun by the other sciences.

Human heredity and nonhuman environment have been the outer limits of politics. Contemporary biology raises issues about the heredity parameter that make it appear far less rigid than once thought. A similar point should be made about the biogenetic engineering of crops, which has already raised regulatory process issues in Europe (Barboza 1999).

means to produce more accurate statistics for political scientists. ³³ Indeed, John Maynard Keynes was never the pure academician. Of the first thirteen years of his professional life, six were spent as a titular civil servant, and at least four on very active duty. When he returned to Cambridge, he spent part of his time in London and engaged in public affairs for the rest of his life. The details are given in his obituary (Harris 1947, xviii).

²⁴ Address to the American Institute of the Biological Sciences, August 1998.

CONCLUSION

I have suggested what young scholars should be encouraged to pursue in the intellectual realm and how the organizational realm might be adapted to the highest improvement of the intellectual realm.

First, political science has a certain competence in that its domain is the study of politics (the organization of power), and about that domain it has competence. It is important always to seek a means to contribute to science, but certain disciplines are more or less capable in some terms or certain areas than are others. At any moment, however, a body of scholars in a given line of work can do what they can and can make very serious efforts to do new things better.

Second, Merriam set forth a number of ideas, some of which have been substantially fulfilled, and some of which have not. The most significant change has occurred in "the field of method." Quantitative and/or mathematical analysis is so pervasive that I think it worthwhile to speak of its triumph. The triumph has yielded good results, but it also has had very important side effects that diminish competence.

Third, the enhancement of competence, which is always our valid purpose, is likely to be served by coherent and strategic focus on some areas identified in the Merriam program that now are considered conventional but lend themselves to further development. The strategic areas have to do with the exercise of power and lie in the fields of public administration, political interests, the politics of urbanization, and the interpenetration of politics and economics.

Fourth, the Merriam formulation also lends itself to serious inquiry in unorthodox subjects, which are not necessarily part of the conventional agenda: (1) force, passive resistance, and noncooperation, (2) the nature of political interests, (3) magic, superstition, and ceremonialism, (4) propaganda, (5) conference, (6) maintenance of morale, (7) leadership, obedience, and cooperation, and (8) the causes of war.

I also place some emphasis on political science inquiry into force and foolish, irrational, and pathological decision making (the Oxenstierna-Mullins effect). Force (and its opposites) has a certain importance, particularly if one does not operate with a theory in which information is the central political variable. In this respect, I depart somewhat from the norm.

Finally, a component of competence that I extract from the Merriam formulation is that of extending the reach of political science into the world beyond the graduate seminar, the journal, and the university press. This means that our decision rules—ultimately expressed in pay and prestige and made or implemented by deans, chairs, promotion and tenure committees, and journal editors in the aggregate—should be altered to allow a higher degree of external engagement. This external search is not simply to further career opportunities; practical problems involve issues that evoke the most serious theoretical effort. That, in a certain way, is the ultimate indicator of the competence of political science.

Improving Quantitative Studies of International Conflict: A Conjecture

NATHANIEL BECK University of California, San Diego

GARY KING Harvard University

LANGCHE ZENG Harvard University and the George Washington University

The address a well-known but infrequently discussed problem in the quantitative study of international conflict: Despite immense data collections, prestigious journals, and sophisticated analyses, empirical findings in the literature on international conflict are often unsatisfying. Many statistical results change from article to article and specification to specification. Accurate forecasts are nonexistent. In this article we offer a conjecture about one source of this problem: The causes of conflict, theorized to be important but often found to be small or ephemeral, are indeed tiny for the vast majority of dyads, but they are large, stable, and replicable wherever the ex ante probability of conflict is large. This simple idea has an unexpectedly rich array of observable implications, all consistent with the literature. We directly test our conjecture by formulating a statistical model that includes its critical features. Our approach, a version of a "neural network" model, uncovers some interesting structural features of international conflict and, as one evaluative measure, forecasts substantially better than any previous effort. Moreover, this improvement comes at little cost, and it is easy to evaluate whether the model is a statistical improvement over the simpler models commonly used.

espite immense data collections, prestigious journals, and sophisticated analyses, empirical findings in the quantitative literature on international conflict are frequently unsatisfying. Statistical results appear to change from article to article and specification to specification. Any relationships usually are statistically weak, with wide confidence intervals, and they vary considerably with small changes in specification, index construction, and choice of data frame.¹

Instead of uncovering new, durable, systematic patterns, as is the case in most other quantitative subfields of political science (and public health, of which this field is also a part [King and Murray 2000]), students of international conflict are left wrestling with their data to eke out something they can label a finding. As a consequence, those with deep qualitative knowledge of

Nathaniel Beck is Professor of Political Science, University of California, San Diego, La Jolla, CA 92093 (nbeck@ucad.edu). Gary King is Professor of Government, Harvard University, Cambridge, MA 02138 (kmg@harvard.edu, http://gking.harvard.edu). Langche Zeng is Associate Professor of Political Science, the George Washington University, Washington, DC 20052, on leave at the Center for

We thank Richard Tucker for providing us with the data set, as well as for many helpful discussions; we also thank Jim Alt, Scott Bennett, Kristian Gleditsch, Simon Jackman, Lisa Martin, Phil Schrodt, and David Singer for helpful comments. An earlier version of this article was presented at the 1998 annual meeting of the Society for Political Methodology, La Jolla, CA. Research support was provided by the National Science Foundation (SBR-9753126 and SBR-9729884), the Centers for Disease Control and Prevention (Division of Diabetes Translation), the World Health Organization, and the National Institutes of Aging.

Basic Research in the Social Sciences, Harvard University.

¹ It is not our intention to provide a literature review. Examples of the fragility of findings and sensitivity of exact specification may be found in Thompson and Tucker's (1997) exchange with Farber and Gowa (1997) and Mansfield and Snyder (1997) on the role of democracy in preventing conflict, or in Oneal and Russett (1997), Barbieri (1996), and Beck, Katz, and Tucker (1998) on the role of trade in preventing conflict. We stress that our examples involve current best practice, so the problems we mention are not the result of data errors or simple methodological mistakes.

the subject are rarely persuaded by conclusions from quantitative works (see Bueno de Mesquita 1981; Geller and Singer 1998; Levy 1989; Rosenau 1976; Vasquez 1993). The field has a number of important successes to its credit, such as the democratic peace, and many important and very promising research programs, but the discontinuity between the beliefs of most experts and many quantitative results remains.

A symptom of the fragility of the various models is their poor forecasting performance. To our knowledge, no legitimate statistical model (using annual data) has ever forecast an international conflict with greater than 0.50 probability, and certainly none has done so while also being correct. Political scientists have long eschewed forecasting in favor of an emphasis on causal explanation, and it is clear that any proposed new method must allow for causal interpretation as well as improved forecasting. But causal theories are considerably harder to verify than forecasts, and forecasts have the advantage of being observable implications of the same theories as the causal hypotheses. This means that accurate forecasts can be used at least in part to verify claims about causal structure. In particular, a claim to have found a causal explanation that is a structural feature of the world but changes unpredictably over time (and so is of no help in forecasting) is of dubious validity and marginal value.

Although political scientists are less likely to evaluate models by their forecasting properties than are, say, economists, forecasting properties underlie all evaluations of the performance of statistical models. For example, all likelihood or goodness-of-fit assessment procedures merely ask whether one specification has superior in-sample "forecasting" properties. Yet, all statistical analysts must be concerned about whether they are taking advantage of some idiosyncratic features of the data to improve fit at the expense of detecting structure and hence out-of-sample performance. To guard against this problem, which is more of a worry with powerful statistical models, out-of-sample

forecast accuracy is generally considered the gold standard for model assessment. Even if we have no interest in prediction per se, the poor forecasting performance of standard models indicates that we can improve on them to provide better knowledge of real-world causal relationships. Forecasting is thus of critical, albeit indirect, interest as a key test of whether we have really found causal structure.²

The scholarly attacks on this problem have come from every angle. The most venerable tradition has been to improve the data and measures of international conflict and its correlates (Jones, Bremer, and Singer 1996). Others have modified existing statistical models to accommodate some of the special features of conflict data (Beck and Tucker 1998; King 1989; King and Zeng 1999). Yet others have attempted to derive statistical models from formally stated rational choice theories based on the motivations of states, political leaders, or other domestic actors (Signorino 1999; Smith 1998). We believe progress will ultimately require advances on all three fronts as well as a convergence in theoretical and statistical models and data.

Our approach is based on the belief that a portion of the problem lies in a somewhat overlooked but key substantive issue that is reflected in the mismatch between available data and the set of statistical methods commonly applied. International conflict is a rare event, and the processes that drive it where it is more common are likely to be very different from those elsewhere. As a result, many qualitative researchers expect the relationships to be highly nonlinear, massively interactive, and heavily context dependent or contingent. Because these characteristics would be missed with standard statistical approaches, particularly the typical linear-normal models imported from studies of American politics, we adopt a form of the highly flexible "neural network model." This type of model is well suited to data with complex, nonlinear, and contingent relationships. It is not a panacea or always appropriate, but it provides an immensely useful tool that has not been sufficiently exploited in this field to date.

As an analogy, consider the use of survey data to assess the consequences of lifestyle on the onset of a relatively rare disease. A supposedly healthful lifestyle may be helpful in warding off the disease for everyone, but a simple logit of disease on lifestyle (and other explanatory variables) would, at best, show a weak relationship, since most survey respondents are unlikely to get the disease in any event. Thus, the logit analysis of disease, like a logit of conflict, will average many small effects with a few large ones. If we could

predict that behavioral changes would have a major effect on avoiding disease for those who are at greater risk for it, this would be a great accomplishment. Similarly, if we could show that autocracy dramatically increases the likelihood of conflict for dyads at risk of conflict, this also would be important. In short, we conjecture that many quantitative international conflict studies lack robustness because they look only for the effects of variables averaged over all dyads, whereas in reality the effects vary enormously over dyads and are only substantively large for those already at relatively high risk of conflict.

We find that our models are able to predict international conflict to a degree. Whereas all previous models are unable to predict the occurrence of any conflict, our out-of-sample forecasts pick up about 17% of these disputes. There is still a long way to go to produce highly accurate forecasts of all these rare and unusual events, if that is ever even possible, but our analyses confirm that there is structure in these data. As for causal interpretation of the underlying structure, our more appropriate techniques find hints of robust and replicable patterns.

In the next section, we propose a simple conjecture that seeks to remedy some of the problems found in the quantitative analysis of conflict. We believe the idea may explain some of the anomalies and nonfindings in the literature and why our model is able to forecast reasonably well. It also highlights the features that an appropriate method would need to uncover stable patterns in this field. We then discuss appropriate methods, apply them to real data, and offer conclusions. The Appendix contains some technical details on Bayesian neural network models.

THE PROBLEM WITH CONFLICT STUDIES

A Conjecture

Our conjecture about conflict studies is quite simple, and aspects of it are implied in much of the literature. The idea is that the effects of most explanatory variables are undetectably small for the vast majority of dyads, but they are large, stable, and replicable when the ex ante probability of conflict is large. For example, Swaziland and St. Lucia have essentially no chance of going to war today. Should either become slightly less democratic, conceivably the probability of war would increase a bit, but the increase would be so small that it would be undetectable and unimportant. In contrast, if Iran and Iraq were to become slightly more democratic, then the probability that they would go to war might drop dramatically. If our conjecture is right, then the effects of the causes of conflict differ by dyad, with trivially small effects for the vast majority and larger effects for a few. That is, it is the effects of the explanatory variables, not merely the levels of the variables, that vary.

To be clear, this conjecture addresses the large literature on country-year dyads. Different processes and theories might apply to data based on daily events series or other more finely grained data collections. We

² Of course, accurate forecasts of international conflict would be of tremendous practical value, as a large portion of the foreign policy bureaucracy in many countries is devoted to this task. A quantitative "expert system" to help guide policymakers could be of considerable use. Forecasts of political conflict also would be of interest to political-business risk analysts, public health researchers, and many others. In informal discussions, several former U.S. policymakers indicated that, aside from occasional commissioned studies, no such quantitative expert system is presently in use. To our surprise, they also indicated that even annual forecasts would be of considerable use in policymaking.

do believe that our simple conjecture may help explain diverse features of the quantitative literature on the causes of international conflict. At the least, it appears to be consistent with several observable implications.

First, most scholars use statistical procedures that assume the effects of their explanatory variables are nearly the same for all dyads. (Some use interaction effects that allow more variation over the dyads, but the degree of variation represented is still quite limited.) The estimates these analyses produce are roughly the average of essentially zero effects for the vast majority of observations and larger effects for a tiny fraction of the cases. Unless the effect is enormous in the small set of dyads with a high ex ante probability of war, estimates from most analyses will appear very small or resemble random noise. Indeed, small to nonexistent and highly variable effects are dominant in the literature.

Second, when effects are huge in the dyads with high ex ante probability of war, the average over all the dyads is large enough to be detected reliably with most methods. (Nonetheless, the estimated effect would be too large for most dyads and far too small for a few.) Some uncontroversial variables in this at-risk subset of dyads include contiguity and time since the last war, indeed, these are among the few variables that often give reasonably robust results across specifications.

Third, if only a few observations have large effects, then small changes in the set of dyads included in a statistical analysis will sometimes have disproportionate effects on the results. This also appears true and may account for some of the apparent instability of results in the literature from article to article.

Fourth, a similar observable implication results from the strong priors most scholars derive from their considerable qualitative knowledge about the field. What can we expect to find when strong priors are combined with statistical methods that assume causal effects are the same for all dyads and when data have a low signal-to-noise ratio? We expect researchers to push their data analyses extremely hard in search of effects they believe are there but are difficult to find. Unfortunately, this would make the results differ from investigator to investigator, just as they seem to, since answers will depend very sensitively on otherwise minor coding decisions.

Fifth, some scholars make coding decisions that seem consistent with our conjecture when they discard all dyads but those deemed "politically relevant" or "at risk," in other words, those with a high ex ante probability of war.³ If our hypothesis is correct, then these coding decisions are problematic methodologically. Such problems are often recognized by the authors, who have little choice but to put some restrictions on an otherwise endless data collection. The difficulty is that coding rules amount to dropping many cases without war and a few with war, which in some instances may generate two types of selection bias. (1) Intentional selection may bias the effect upward if the

relevant population to which one is inferring is all dyads and otherwise may correctly increase the effect. (2) Except when the definition of "politically relevant" is clearly based on one of the explanatory variables (e.g., Maoz 1996), these rules also select on the dependent variable, which biases estimates of the probability of conflict. Whatever the goal of the inference, studies that address the problem by selecting cases in this way may give answers that are too small or too noisy, which appears to be the case throughout the literature. The results from these selection rules will be somewhat stronger than when using the entire data set but not as large as qualitative experts expect. Indeed, this seems to fit the literature.

Finally, if our conjecture is right, then the application of an appropriate statistical technique will confirm the existence of sizable and robust effects in the high exante probability of war dyads and tiny effects elsewhere. For many variables at least, the direction, magnitude, and nature of the large effects should not be wildly inconsistent with our qualitative knowledge of international relations, unless there is a clear reason. If this method indeed finds real features of the international system, rather than some idiosyncratic sample characteristics that result from our specification choices or coding rules, then out-of-sample forecasts ought to predict similar patterns in the next data set.

The first five of these observable implications of our conjecture are consistent with observations from the literature. Testing the sixth will occupy most of the rest of this article.

According to our idea, international conflict data differ from other rare events data sets in two ways. The effect of any single explanatory variable changes markedly as a function of changes in the other explanatory variables (that is, there are strong and complicated interactions), and the dependent variables are, in principle, powerful enough to predict whether conflict occurs if the appropriate model is used. Some other rare events data, such as in epidemiological studies of disease, may fit this description, but only if all these characteristics apply.⁴

STATISTICAL MODELS OF INTERNATIONAL CONFLICT

Relative to other types of data and processes studied in political science, international conflict data have some unusual characteristics. They are based on thousands of dyads (combinations of countries taken pairwise) or directed dyads (the actions of A toward B and of B toward A are separate observations in the same data set). Whether the universe of dyads should include only originators of conflict, all nations, or some group in between is by no means clear. Most outcome variables

³ See Bremer 1992 for this argument in its modern statistical guise and Richardson 1960 for some early intuition.

⁴ The leading alternative explanation for the problems in this field as that the data are so bad that it is impossible to discover patterns. Data problems clearly exist (e.g., Vasquez 1993), and may be more severe than in other fields, but they are not unique to international relations.

are dichotomous. The data often concern rare events, with hundreds of times more 0's (peace) than 1's (conflict). Often the explanatory variables are neither dichotomous nor quite continuous, with distributions that are asymmetric or with multiple mass points (such as at the end or midpoint). The indices often are necessarily complicated combinations of diverse measures. In addition, assuming our conjecture is correct, very small parts of very large data sets contain most of the interesting information.

The statistical method we introduce here is a version of a neural network model, first introduced to political scientists by Schrodt (1995) and Zeng (1999, 2000).5 There is an immense literature supporting this technique in engineering, computer science, statistics, psychology, linguistics, neuroscience, medicine, finance, and other fields. Neural network analysts have adopted an extensive and essentially unique terminology. The language is useful because it helps emphasize the rough analogies between these statistical models and some theoretical models of the way human brains may work. Using this language to describe concepts known to political scientists by other names can be counterproductive. Therefore, we introduce these models as straightforward generalizations of logistic models, which are the most commonly used statistical models of international conflict.

In the following subsections, we make the transition from logit to our neural network models. We examine various issues related to estimation, interpretation, and inference with our model, and we introduce the main ideas of Bayesian methods for neural networks adopted here. We also discuss several potential objections to neural networks.

From Logit to Neural Networks

Our dependent variable, Y_i , takes on a value of 1 if dyad i (i = 1, ..., N) is engaged in an international conflict, 0 if it is at peace. If conflict and peace are coded as mutually exclusive and exhaustive (which we make true by definition), then a Bernoulli distribution fully describes this variable. The only parameter of a Bernoulli distribution is π_i , the probability of an international conflict. Let a vector of a constant term and k explanatory variables be denoted $X_i = \{1, X_{1i}, X_{2i}, ..., X_{kl}\}$.

The next step is to specify the relationship between π_i and X_i . The simplest possibility is a linear function, which results in what is known as the linear probability model:

$$Y_{i} \sim \text{Bernoulli}(\pi_{i}),$$

$$\pi_i = X_i \beta = \beta_0 + \beta_1 X_{1i} + \cdots + \beta_k X_{ki}, \qquad (1)$$

where $X_i\beta$ is merely a matrix expression for the linear relationship between π_i and X_i ,

$$\pi_i = \operatorname{linear}(X_i),$$

and the $(k+1) \times 1$ vector β includes a constant term and k weights (or coefficients) on each of the k explanatory variables. The problem with the linear probability model is that it can generate impossible values of π_i (greater than 1 or less than 0), so even values within the correct range near the boundaries are questionable. Moreover, the full posterior distribution for π_i generated by the linear probability model never makes sense in any application because at least some density always falls outside the unit interval. These problems were known long ago, and the linear model was almost entirely supplanted by logit models when these became computationally feasible.

The logit model is similar to the linear probability model except for the functional form:

$$Y_i \sim \text{Bernoulli}(\pi_i),$$

$$\pi_i = \operatorname{logit}(X_i \beta) = \frac{1}{1 + e^{-X_i \beta}}.$$
 (2)

The logit model maps the linear functional form $X_i\beta$, which can take on any value, into the [0,1] interval required for π_i by applying the logit function. The vast majority of analyses in conflict studies use some form of this method. For our purposes, it is important to recognize that the second line of equation 2 specifies the underlying probability of conflict, π_i , as a logit function of a linear function of X_i ,

$$\pi_i = \operatorname{logit}(\operatorname{linear}(X_i)).$$

The logit is thus a generalization of the linear probability model, created by adding an extra level of hierarchy. Our neural network model will generalize the logit by adding an additional level of hierarchy.

The logistic model in equation 2 improves on simple linear probability models by avoiding impossible probability values and assuming a more plausible relationship between the explanatory variables and the probability of an outcome. The effect of each explanatory variable varies across observations, however, and depends on the values of other explanatory variables only slightly more than does the linear model. These effects also depend only trivially on the ex ante probability of conflict (see Nagler 1991). One way to look at changes in the effects of explanatory variables is to examine the derivative of the probability π , with respect to one of the explanatory variables, say, X_{1i} . For linear models this derivative is β_1 , which is obviously constant. For logit models, the derivative is $\pi_i(1-\pi_i)\beta_1$, which is better. But since π , is within a small range above zero for all but a few observations (and, given the logit model's inflexibility, virtually all observations in practice), this is a highly restrictive and nearly constant

⁵ General references on neural networks include Rumelhart et al. (1986), Muller and Reinhardt (1990), and Hertz, Krogh, and Palmer (1991). Detailed discussion of neural networks as statistical models can be found in, for example, Bishop (1995), Cheng and Titterington (1994), Kuan and White (1994), Ripley (1996), and White (1992). A recent application in political science is Eisinga, Frances, and Van Dijk (1998), who estimate a constrained neural network model similar to a generalized additive model. While this application is completely different from our conjecture, it does show the great flexibility of neural nets and their applicability to many complicated data problems.

specification. To avoid this weakness, two different types of generalizations might be considered, either of which would be an improvement, but neither of which is sufficient.

First, we might specify a random effects model. Instead of leaving β fixed at one set of values, as in equation 2, we could let it vary randomly over the observations in some form, such as $\beta_i = \beta^* + \epsilon_i$. Although some assumption about randomness may be better than logit's more restrictive assumption of constant effects, our conjecture is not that the coefficients vary randomly across dyads; rather, they vary systematically with the ex ante probability of conflict as a function of complicated conjunctions of all the explanatory variables.

Second, standard interaction effects can be applied. For example, we might let the effect β_d of democracy X_{di} be a function of whether the states in the dyad are contiguous X_{ci} , by specifying, say, $\beta_{di} = \gamma_0 + \gamma_c X_{ci}$. Substituting this expression back into the second line of equation 2 produces an interaction effect that is easy to estimate: Merely include $X_{dr}X_{cr}$ as an additional variable in X_i and use any standard logit package. This strategy will work in some cases, but it requires a good deal of prior knowledge of the types of interactions to specify. If one does not have sufficiently detailed knowledge, then the number of interactions one would include generally would not be precisely estimable with available data. In fact, too many interaction terms can result in severe problems of numerical instability due to colinearity. In conflict data, massive interaction effects are suspected, most of which are concentrated in tiny areas of the parameter space. Standard interaction-based logit models are too restrictive, require too many interactive terms, and do not address the expected degree of nonlinearity.

Our preference for an approach to this problem is the massively interactive and highly nonlinear neural network model, in particular, the single hidden layer feed-forward perceptron. This biological language sounds complicated, but it can be expressed as a statistical model that is a straightforward generalization of the logit model.

Logit models use an "S-shaped" curve to approximate the relationship between the probability, π_l , and the explanatory variables, X_l . Imagine how much better the approximation could be if more than one such curve were used simultaneously, each with a different curvature and orientation; roughly speaking, that is what neural network models allow. In order to approximate the relationship between π_l and X_l with a set of M logit curves, we use a neural network model with the same distribution as but a different functional form from the logit and linear probability models:

$$Y_{t} \sim \text{Bernoulli}(\pi_{t}),$$

$$\pi_{t} = \text{logit}[\gamma_{0} + \gamma_{1} \text{logit}(X_{t}\beta_{(1)}) + \gamma_{2} \text{logit}(X_{t}\beta_{(2)}) + \cdots + \gamma_{M} \text{logit}(X_{t}\beta_{(M)})].$$
(3)

This neural network model is a type of discrete choice model that differs from the logit only in the shape of the curve. It is easiest to compare this relationship with the standard logit in the special case when M=1, since the second and third lines of equation 3 are then just a logit function of a linear function of a logit function of a linear function:

$$\pi_i = \operatorname{logit}(\operatorname{linear}(\operatorname{logit}(\operatorname{linear}(X_i)))).$$

The larger the value chosen for M (known in the literature as the number of "hidden neurons," but of course nothing is hidden), the more logit curves are used at the third level of generalization and, as a result, the larger variety of shapes the entire expression can approximate.

To be more specific, β in the logit model in equation 2 is a $(k + 1) \times 1$ vector of effect parameters (corresponding to a constant term and the weights on the k explanatory variables). After the β 's are multiplied by their respective X_i 's and summed up, logit $(X_i\beta)$ is then one number, which we also label π_i . In contrast, the $\beta_{(1)}, \ldots, \beta_{(M)}$ parameters in the second and third lines of equation 3 are each $(k+1) \times 1$ vectors, so that each expresses a different weighting of the k explanatory variables. Then the logit function is applied to each of the different weighting schemes $X_i\beta_{(1)}, \ldots, X_i\beta_{(M)}$ to yield a set of M numbers: $logit(X_i\beta_{(1)}), \ldots, logit(X_i\beta_{(M)})$. A weighted sum of these M numbers is taken (with the γ 's as adjustable weights in this linear expression), and the logit is taken one final time to make sure that the entire expression yields a number for π_i that is between 0 and 1. The result is, as we shall see below, a remarkably flexible functional form.

Neural networks meet the needs of conflict research because they allow the effect of each explanatory variable to differ markedly over the dyads, as required by our conjecture about international conflict. As in the case of linear probability and logit models, this can be made clear by examining the partial derivatives of π , with respect to the independent variables. After some straightforward calculus, this yields

$$\frac{\partial \pi_{i}}{\partial X_{ik}} = \pi_{i}(1 - \pi_{i}) \sum_{j=1}^{M} \gamma_{j} \beta_{(j)k} \operatorname{logit}(X_{i} \beta_{(j)}) \times [1 - \operatorname{logit}(X_{i} \beta_{(j)})],$$

where h indexes explanatory variable h in X_i and element h in β_j . From this expression, it is clear that our neural network model allows much more range in the marginal effects of independent variables across dyads than do the linear probability or logit models: The effect varies not only with π_i across dyads but also with X_i and all the logit curves. Although each element in the summation is limited in size, the combination of all the terms can produce wide differences.

More generally, what makes neural network models attractive as statistical models is that they provide a class of functional forms that can approximate any hypothetical relationship between π_i and X_i , given a large enough choice for the number of logit functions

M (Hornik 1990; White 1992, 12-28).6 Although the functional form in equation 3 has a fair number of adjustable parameters (M(k + 2) + 1), in comparison to other flexible functions that also have general approximation capabilities, such as those based on polynomial spline or trigonometric functions (e.g., Gallant 1981), neural networks normally require far fewer parameters to model the same level of complexity (Barron 1993). They are often described as occupying a middle range between standard parametric models, with a small number of parameters, and nonparametric models; with almost infinite flexibility (Ripley 1996). Neural networks allow for a wide variability of marginal effects, and their flexibility and general approximation capabilities far outperform standard logitbased interaction models.

Is there a middle ground between the simple logit model and the more complicated neural network approach? One possibility is generalized additive models (GAMs), which are more flexible than logit because they permit nonmonotonicities in the probability of a conflict, but they do not allow relationships as rich as neural networks because most interactions are disallowed (Beck and Jackman 1998). Our extensive experiments with these and other approaches caused us to conclude that only neural network models capture the full nature of the substantive relationships in these data. Of course, one could go even farther, toward more flexible relationships, such as through the use of nonparametric methods. Perhaps future researchers will find some of these techniques appropriate, but to date we have not found that the additional flexibility is warranted. Finally, we do not believe that neural network models should in all cases replace logit models in quantitative studies of international conflict, but our results seem to indicate they have a place in the toolkit of international relations researchers. Further work is needed to build theories based on the structure uncovered, and other research may indeed discover more parsimonious methods.

Issues in Neural Network Modeling

The use of neural networks involves the same issues of model selection, estimation, interpretation, and inference as for any other statistical model. Some of these issues are more common in models with flexible functional forms, like ours, and so demand special attention. For example, in equation 3, how do we choose the size of M? How do we compare results from the different models? For a given model, how are the parameter values determined? How are they inter-

preted? How does statistical inference proceed, and how do we handle uncertainty?

Recent developments in Bayesian methods for neural networks allow disciplined treatment of each of these questions. We adopt the Bayesian framework with normal approximation (MacKay 1992a, 1992b, 1992c, 1994), which is discussed in the Appendix. Here we highlight some of its basic ideas in connection with the questions raised above.

The central feature of the Bayesian approach is to treat everything as probabilistic. Hence, instead of estimating the "true" values of some fixed parameters, we look for their posterior distributions given the data. Model building and inference is then a process of updating our beliefs about the world using the information we receive from empirical data. In the normal approximation framework for neural networks, we assume normal prior distributions for the parameters B and y that are centered on zero; that is, we believe it more likely that the parameters take smaller values than larger ones. This prior merely reflects the common belief that a certain degree of "smoothness" in the underlying data-generating function is likely (smaller parameter values result in smoother functions, since the logit transformation is flattened as the parameter values decrease). We then apply Bayes's theorem to evaluate the posterior distribution of the parameters used to evaluate the predictive distribution of the dependent variable (by integrating out the parameters). For complex functions like neural networks, there are no analytical solutions for the integration, and Monte Carlo methods of sampling the distribution are computationally very burdensome. Hence, we follow MacKay (1994) and approximate various intermediate distributions with normals, since they are analytically easy to treat and simple to sample (see the Appendix). This enables us to arrive at the posterior probability of π_i , given our data.

How to Select M and Avoid Overfitting. In conventional (non-Bayesian) neural networks, selection of M, the number of logit curves, is an important issue, as too large M can cause "overfitting." Overfitting is a danger with any statistical model, but especially so for very flexible forms. A model that is too flexible picks up idiosyncrasies unique to a particular data set rather than the structural features of the world that pertain to out-of-sample data. The danger is always real, and many attempts have been made to develop procedures that protect against it. Of course, "underfitting" (or missing relationships of interest) is a danger as well, so there is good reason to think that M > 1.

In the Bayesian framework, the presence of smooth priors for the parameters significantly alleviates the problem of overfitting. Instead of searching for the set of parameter values that maximize the model performance on the training data, we look instead for solutions that at the same time punish model complexity. More important (in principle at least), in the Bayesian paradigm no single model is the correct one. Rather, because each alternative is correct with some probability, different models can be compared by examining the

⁶ The large variety of neural network models includes many that are even more general than equation 3, as they allow additional levels of hierarchy, stacking functions within functions, and feed-backward effects (as in the so-called recurrent neural networks [Holland 1998], which are appropriate for modeling time series data). In addition, one can choose functions other than logit or even mix several different functions in the same analysis. Neural network models also can be used with stochastic components other than Bernoulli to model different types of dependent variables.

measures of evidence for them.⁷ In practice, however, there is a fairly straightforward test of whether one is finding structure or overfitting ephemera. The procedure is to set aside a portion of the data as a "test set," fit the model to the remaining data (the "training set"), and see whether the forecasts hold up.⁸ Because there is always the tendency to iterate back and forth between fitting models to the training set and verifying the model in the test set, we set aside two test sets, the second of which we did not consult until all exploratory work was completed. This second test set was used only to compare the performance of the chosen neural network specification and the corresponding logit specification.

Interpretation. The neural network literature is concerned almost exclusively with pattern recognition and forecasting, and the issue of interpreting the effect of the explanatory variables on π_i has not received much attention. In political science research, however, interpretation of causal effects is equally critical. The problem is that the functional form is so flexible, and the estimated relationships between π_i and X_i can be so complicated, that the parameters $(\beta_{(1)}, \ldots, \beta_{(M)})$ and $\gamma_0, \ldots, \gamma_M$) are almost impossible to interpret directly. We have created a graphical device that enables us to produce highly interpretable results. For example, we can plot the expected value of (and confidence intervals for) the probability of conflict by one or two explanatory variables, while holding the remainder constant at chosen values. Of course, since neural networks allow estimation of different effects for different observations, the values held constant are critical features of interpretation. The identical methods can be used with regression models but are not needed because the effect parameters are constant, and so the whole functional relationship can be easily summarized with a single number. We elaborate on these methods of interpretation later.

Of course, in practice, interpretation is a problem for any statistical model beyond the very simple linear additive setup. That is why we introduce several graphical procedures for interpreting the results of neural networks.

Possible Objections to Neural Networks

Neural networks come with considerable baggage; some criticism is deserved, some not. Before going into

⁷ There are theoretical results that can help with overfitting. For example, Neal (1996) proves that a Bayesian neural network can use an infinite number of logit curves without causing improper behavior in the output function, provided that the prior variances are properly scaled. He suggests one should choose the most complicated model that is computationally feasible (the largest possible M) and scale the variance of the priors so that it is related to model complexity. This way, one has a model capable of extracting as much information as possible, but the data are taxed to the same degree. Unfortunately, this requires use of extremely time-consuming computational algorithms, as discussed in the Appendix.

*Validation with training and test sets can be improved in theory with such techniques as cross-validation, which breaks the data set into all possible splits. In practice, most users keep a single test set aside.

a detailed analysis using neural nets in the study of conflict, it would be helpful to put to rest a few issues that may come to mind when the term "neural networks" is used.

First, neural networks are sometimes treated as a black box for classifying very complex data patterns in the absence of theory (e.g., handwriting recognition). In contrast, we hypothesize that for international conflict data there are massive nonlinear interactive effects, and only the confluence of many causal factors leads to a nontrivial increase in the probability of war. This allows us to interpret the output of the model in a way that is useful for the international relations scholar, not simply as a black box that does a good job of classifying which observations are more or less likely to be conflictual.

Second, why neural networks? Would simpler and more well-known interactive methods work better? The answer is no. Linear or logit models can include multiplicative interactions, but these have not worked well in practice. Even bivariate multiplicative interactions have not performed well because of multicolinearity. Our evidence indicates that interactions in international conflict are considerably complicated. We need a method that can deal with massively nonadditive interactions, not one that can be grudgingly "tricked" into allowing for a few simple interactions.

Third, early research in neural networks stressed nonstatistical pattern recognition, but we rely on more recent work that puts neural networks on a firm statistical foundation. We use more complex variants of well-known statistical models, and they come with all the standard apparatus for validating and comparing models and avoiding unnecessarily complex specifications. If our conjecture is false, and simple logit performs as well as complex neural net models, then the in-sample and especially the out-of-sample forecasts will clearly indicate this. The statistical basis of our work means we need not fear that neural nets are just very good at picking up in-sample idiosyncrasies in the data.⁹

Fourth, we guard against overfitting by relying extensively on out-of-sample forecasts to validate our models. If neural nets do not detect "real" properties of conflict data, merely idiosyncratic patterns, then they will yield good in-sample but poor out-of-sample forecasts. Many of the problems associated with early nonstatistical neural network models can be avoided by using only models with a firm statistical basis and then evaluating the performance of all models with out-of-sample forecasts.

In brief, neural nets have a venerable history with

⁹ The simple logit is not formally nested within the neural nets we use, but in the data analysis presented below, the forecasting performance of the neural network is so overwhelmingly superior that any criteria for discriminating between nonnested alternatives would clearly choose it over the logit. This does not imply the choice of neural network specification, or any other statistical specification, is a purely mechanical task. Art is involved in any model choice, and no less so in the choice of a particular neural net specification. But the out-of-sample forecast test guards against being "too artful."

numerous success stories. Many criticisms apply to the early nonstatistical variants. Modern neural nets are as firm a part of statistics as are its simpler variants, starting with the logit. As long as we use techniques that allow empirical work to discern whether the additional complexity is both necessary and useful, there should be no reason to fear and much to gain from the newer, more sophisticated, methods.

FORECASTING AND EXPLAINING POSTWAR CONFLICT

In this section we discuss the data and model, forecasting performance, and causal structure in the model results.

Data and Model

In order to test our conjecture, we use the standard dyad-year design, with the same data and variables employed repeatedly in the scholarly literature. This eliminates the possibility that the improved performance of our model is due to better data. For similar reasons, we limit ourselves to politically relevant dyads (PRDs), that is, pairs of essentially contiguous states or with at least one major power, on the grounds that non-PRDs are unlikely to engage in militarized conflict. We thus focus on the harder test of finding variable effects among this more selected homogeneous set of dyads.

Specifically, we use data compiled by Richard Tucker (1997) from a variety of sources. ¹⁰ The set contains 23,529 dyad-years between 1947 and 1989. The dependent variable is coded one for dyad-years with a new "militarized interstate dispute" (MID), zero otherwise (Gochman and Maoz 1984; Jones, Bremer, and Singer 1996), with years of MID after onset dropped. MIDs are rare, occurring in only 976 (4.1%) of dyad-years.

The explanatory variables include dummies for whether the dyad contains geographically contiguous countries (Contiguous) and is allied in defense pacts, neutrality pacts, or ententes (Ally). The similarity of state preferences between two partners (Similarity) is measured, as usual, by the resemblance in their alliance portfolios. The similarity data we use here are from Tucker (1999) and are based on a measure developed by Signorino and Ritter (1999); the measure runs from −1 to 1, where 1 indicates maximal alliance portfolio similarity. The imbalance of power within the dyad (Asymmetry) is measured by the Ray and Singer (1973) index of relative capabilities of the dyadic partners. It is continuous, ranging from 0 to 1; 1 indicates that all military capability is held by one partner, whereas 0 indicates an exact division between the two.

The key variable in many conflict studies is the degree of democratization of the dyad. We use a slightly updated measure from the Polity III (Jaggers and Gurr 1996) data set. As is common, we measure

each partner's democracy by the difference between its "democracy" and "autocracy" scores. This differenced measure ranges from -10 (extreme autocracy) to +10 (maximal democracy). Conflict scholars have debated about the proper way to construct a single dyadic democracy index from the two measured democracy scores, but it is easy enough to enter both (Dem a and Dem b) into the analysis.¹¹

Finally, we use the number of years since the last conflict (*Peace Years*) as a measure of temporal dependence (Beck, Katz, and Tucker 1998). This variable controls for the possibility that conflict is more likely to erupt after previous disputes than after a long period of peace. As Beck, Katz, and Tucker show, the addition of this variable turns an ordinary logit analysis into a grouped proportional hazard model.¹²

We divided the data into an in-sample training set, 1947–85, which we use to fit the model, and a test/validation set, 1986–89, which was used only once to evaluate the forecasts. We fit the neural network model in equation 3 to the training set. Without looking at the test set, we experimented with setting M to various values. We did this by putting aside different portions of the 1947–85 data and trying different values of M (in the spirit of cross-validation). Only after we completed this testing did we look at the 1986–89 data. We also fit a standard logit model to the training set for comparison.

We found that an *M* set around 25 provided about the right level of flexibility and predictability for our data (see the Appendix). This seemingly large value is counterbalanced by our priors, which favor small values for all parameters. This means the model in total is a very flexible functional form that heavily favors smooth curves with few bends. Deviations from this smoothness only occur when the data provide clear evidence to the contrary. That is, unlike logit models and other low-dimensional parametric forms, when the data speak loudly enough, the fit responds.

¹⁰ The measures are more fully described m the Appendix. The data set is archived on the *APSR* web site.

¹¹ For each observation, we randomly assign A to one dyadic partner and B to the other, which is consistent with the hypothesized symmetric effect (and confirmed by our empirical analyses). The traditional approach of creating a single index similarly treats the two countries as symmetric and exchangeable. For simplicity of presentation, we chose not to do this for asymmetry as well, although it would be a reasonable approach to explore.

¹² For most complicated maximum likelihood models, such as for duration or count data, neural nets can be used to replace the simple specification that the underlying mean is a linear function of the data with one that the mean is a massively interactive function of the data. As of now, no off-the-shelf software can do this, but programming these more complicated models is straightforward if nontrivial. We focus here only on the binary outcome case.

¹³ The 1947-85 data were randomly divided into training and test sets of equal size. The random split was possible because the peace years variable induced conditional temporal independence. As a further check on the choice of *M*, the pre-1986 data were split again, and the choice of *M* was rechecked and validated with the new test set. We chose to do final validation on the data split temporally, that is, the last four years of the data set, to provide a tougher test for the neural net forecasts. The use of this hold-out set also makes our validation look more like a true forecasting exercise.

Year	Conflict: % Correct		Number	Peace: % Correct		Number
	LogIt	NN	of 18	Logit	NN	of 0s
1947–85	0	25.3	892	100	99.58	20,155

Total	ñ	24.6	976	100	99.57	22,553

Forecasts

Table 1 gives one view of the comparative forecasting performance of the logit and neural network (NN) models. In the table, we divide the forecasts into conflict (1) and peace (0). The left-hand portion reports success at forecasting conflict when it occurred, and the right-hand portion gives success at forecasting no conflict when there was none. As is clear, since the logit model never forecasts that a conflict will occur in any one dyad (i.e., the probability never reaches 0.50), it forecasts incorrectly for all the cases of conflict and correctly for all the cases of peace. This is no great success, of course, since the optimistic claim that conflict will never occur is correct 96% of the time!

The table indicates that the neural network model performs substantially better than the logit, using the identical set of explanatory variables. It is nearly as good as the logit at predicting peace, with all probabilities exceeding 99% correct. More important, when military conflict occurs, the neural network model makes a successful forecast 16.7% of the time. This is not high in an absolute sense, but it is much better than the logit success rate of zero. Given the high costs of military conflict and the tremendous benefits of knowing ahead of time when a war will occur, this improved forecasting performance could be of significant policy value. More significant, from our perspective, is that the model's forecasting performance confirms a durable causal structure. The relatively high percentage of successful predictions is within a reasonably narrow range, from 12.5% to 23.1%, for each of the four out-of-sample years, which further confirms the overall result with separate, although not independent, observable implications. Furthermore, most of these figures are lower than their fit to the training set, which is as it should be if we expect not only structure but also change in the real world. The model predicts 25.3% of conflicts correctly in-sample but only 16.7% correctly out-of-sample, which indicates either slight overfitting (the difference is just outside the 95% confidence interval) or change in the real world after 1985.¹⁵

Table 1 demonstrates that the neural network model discriminates far better than the logit model by assigning very different probabilities of international conflict to the available dyads. It does not indicate whether either model's probability values are correct except for above and below the 0.50 mark. For example, if we observe 1,000 dyads with a 0.10 probability of going to war, none of these individual pairs would be predicted to fight, but we would expect to see 100 wars from somewhere in the set. We now evaluate the extent to which the two model's predictions have this desirable characteristic.

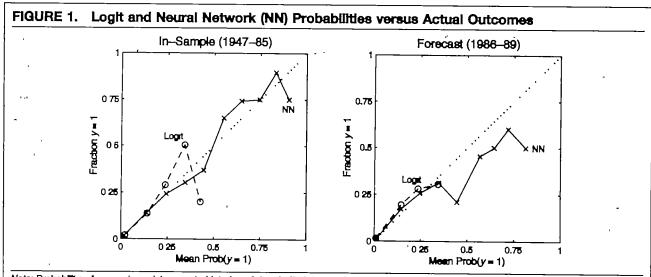

We begin by computing predicted probabilities for each dyad from the logit and neural network models. We then sort these into bins of 0.1 width: [0, 0.1), [0.1, 0.2), ..., [0.9, 1]. Within each bin, we compute the mean predicted probability (which presumably will be near its respective midpoint) as well as the observed fraction of 1s in each bin. We compare the two to check the fit of the model in the training set and to evaluate the forecasts in the test set. Figure 1 plots these numbers for both statistical models.

The in-sample graph in Figure 1 shows that the predicted probabilities and observed fraction of conflict match fairly closely for the neural network model. The logit model is reasonably close as well when the mean probability is 0.25 or less, but it does much worse for higher (i.e., more interesting) predicted probabilities. This is especially important from our perspective: The logit model not only predicts peace breaking out all over but also becomes more inaccurate as the probability of conflict increases, even though these cases are very rare. ¹⁶ In contrast,

¹⁴ If the costs of misclassifying wars versus peace differ, then decision theory indicates that one should merely change the threshold of prediction from the 0.50 that is used here and in virtually all the literature. But that would merely increase the predictions of 1 and correspondingly decrease the predictions of 0 with no other changes in the statistical model and/or interpretation, so we retain the traditional 0.50 cutoff. Figure 1, below, demonstrates that the neural net, but not the logit, fits well for any chosen threshold. The 0.50 threshold seems the most appropriate to us, but none of our comparisons depend on it, and there is no choice of threshold that would make the logit's performance close to the performance of the neural net.

¹⁵ The logit model is the standard in international relations, but it is interesting to compare our results to that of a GAM. Using identical explanatory variables, the GAM forecast slightly better than logit but much worse than a neural network. Using the same comparisons as in Table 1, the GAM correctly predicted 5.6% of all in-sample disputes (and 99.9% of all nondisputes). Similarly, the GAM equivalent of Figure 1 showed performance that was slightly better than the logit but much worse than the neural network.

¹⁶ The one possible exception is the last mean probability bin for the logit, which has very few observations, so the fraction of conflicts has much higher sampling variability. (We chose not to add error bars for each point so that the graphs are easier to read; the precision with which each point is estimated is higher at the left than the right of the graph.)

Note: Probabilities from each model are sorted into bins 0.1 wide (0, 0.1; 0.1, 0.2, ...) and averaged. These averages are plotted horizontally and the actual fraction of ones in the bin are plotted vertically. A line for a model that fits the data will differ from the (dotted) 45 degree line only by random chance. In both the in-sample graph (on the left) and the forecast out-of-sample graph (on the right), the fit is better for NN than logit, and, in addition, NN predictions exact for much higher probability bins than logit predictions.

when the neural network model gives a probability, it is a reasonably accurate assessment of the odds of a conflict occurring within the sample. Of course, an equally important difference between the two models is the much more acute discriminatory power of the neural network model, which we can see because the logit never yields any predicted probability of conflict above 0.50.

Whereas the in-sample graph in Figure 1 evaluates the fit of the two models to the same data, the out-of-sample graph uses the same technique to evaluate forecasting success. Again, there is a reasonably close correspondence between the estimated probabilities and observed fraction of conflict for both models. They track each other very well for the lower probability bins, indicating the same high level of success. (The fact that the logit model did not fit well to the last two points in-sample but did fit the out-of-sample plot seems to be a lucky coincidence.) More interesting is that whereas the logit model has no forecasts in the high-probability region. the neural network model tracks the observed fractions reasonably well even for the sparsely populated high probability bins. One possible problem is the noticeable overestimation of conflict for the neural network model in this high-probability region (which indicates that our forecasts could be improved), but the observed numbers are both fairly small and not that far off.

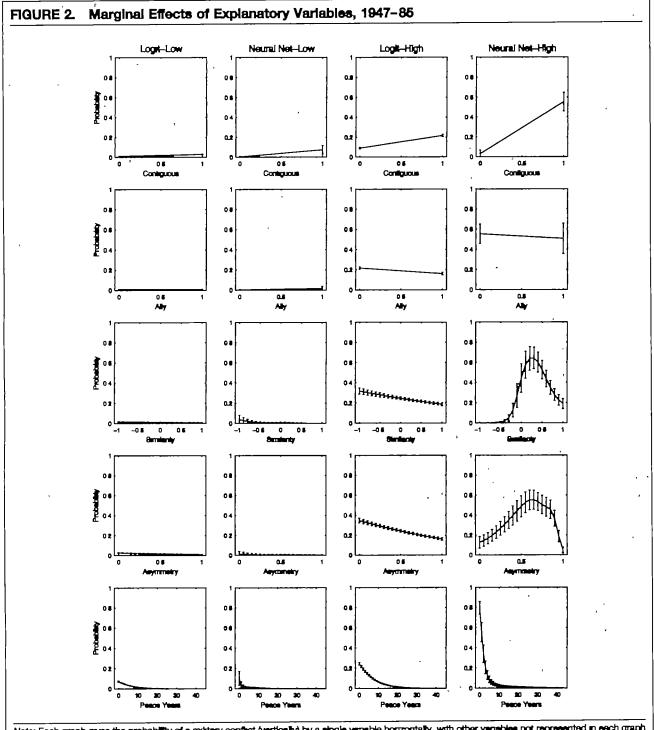

We believe these forecasts are quite solid, and although many uncertainties remain, they seem to be far better than any previously produced. They are also more accurate than many scholars thought would be possible. This clearly indicates that the neural net model we use is superior to the logit model in our data.

Causal Structure

We believe our model reveals clear evidence of structure in international conflict data. This evidence is consistent with that predicted by our conjecture about models of conflict. To interpret the results, we created what we call marginal effect graphs that plot the probability of conflict by one explanatory variable, holding all the others constant at a designated value. Since our conjecture about conflict studies holds that the effect of most variables will be larger (i.e., more discriminating) when the ex ante probability of war is greater, we hold constant the other variables at two values: high and low probability of conflict. (For simplicity, we compute these by the median of each explanatory variable among observations, where Y = 1 and Y = 0, respectively.)

Figure 2 presents these graphs for the logit and neural network model for each of the explanatory variables except democracy (which we will discuss separately). The low and high controls for the logit model appear in columns one and three, and for the neural nets these are given in columns two and four. Each explanatory variable appears in a separate row; the vertical lines on the graph are one-standard-error bars surrounding the predicted probability. (Examining results as we do, by grouping dyads according to the ex ante probability of conflict, creates no selection bias, nor does selecting cases based on the probability of conflict, because the analysis has already been conducted with all dyads.)

Substantively, the neural network analysis in Figure 2 shows a few similarities to conventional logit analysis, but it also demonstrates features consistent with our conjecture. As can be seen by comparing the first and third columns, logit analysis allows for greater effects of the explanatory variables when the ex ante probability of conflict is high, but the differences are small, and virtually all the logit effects are substantively small. Even in the high ex ante case (column 3), only contiguous and peace years have a notable substantive effect on the probability of conflict. Thus, the logit model presented here is similar to the typical logit model of conflict: democracy (see Figure 3).

Note: Each graph gives the probability of a multipry conflict (vertically) by a single variable horizontally, with other variables not represented in each graph held constant at designated values that govern high or low ex ante probabilities of conflict. Note how the effects are much larger for the neural network than logit columns, and especially large for high ex ante probability of conflict dysids under neural networks.

contiguity, and peace years have statistically significant, though substantively small, effects on conflict, whereas the other variables have statistically insignificant (or marginally significant) and very small substantive influence.

In contrast, the neural network model produces much larger changes in the effect of any variable as we move from a low to a high ex ante probability of conflict (compare the second and fourth columns). This is

particularly obvious for some of what normally might be considered "control" variables. For example, contiguity has a strong effect on the probability of a dispute in the logit analysis, but this effect is more than doubled for the high-probability case in the neural network analysis. The effect of contiguity is so strong that it is not hidden by the logit analysis, but allowing for complex interactions shows that it has the extremely strong influence that we would expect but that previous researchers were unable to demonstrate.

The neural network analysis also reveals the importance of duration dependence (peace years) when the ex ante probability of a dispute is high. Although the logit analysis finds some evidence of this dependence, it is quite modest. For high ex ante probability of war situations, with a conflict occurred last year, the probability of another under logit analysis is less than 0.25, compared to almost 0.80 under neural network analysis. It takes about a decade for this probability to recede to nearly zero. Clearly, both analyses give a similar pattern of decay, but the more flexible NN gives a much higher maximum probability of a dispute. The effect of the duration of peace on the probability of a dispute is clearly underestimated in the logit analysis. Duration dependence is sufficiently strong to emerge in the logit analysis to some degree, but the lack of interactions in that model does not allow us to discern how critical time is in forecasting future disputes.

NN also reveals that two important determinants of disputes, similarity and asymmetry, have a very strong but nonmonotonic effect on probability. The logit analysis assumes that all effects are monotonic and so cannot detect these kinds of relationships. The NN analysis reveals a stronger and more complex association between these variables and conflict.¹⁷

Our findings of nonmonotonic effects are consistent with the more game-theoretic studies of Bueno de Mesquita and Lalman (1992) and Signorino (1999). Both similarity and asymmetry are the two standard measures of the benefits and costs of conflict. For example, these theories assume that as one side acquires comparatively more military capability, the probability of conflict will rise and then fall, but no logit model in the literature or here supports this claim for either asymmetry or similarity, or even indicates that either has results of any kind of important size. In contrast, the NN results reveal both are very important in high ex ante probability dyads in just the manner predicted by theory. Indeed, in the high ex ante probability dyads, a large change in either similarity or asymmetry can increase or decrease the probability of conflict by more than 50 points.

Finally, NN models show a clear influence of dyadic democracy on the probability of conflict. The logit analysis, which averages effects over all dyads, shows a small but significant pacific effect of democracy. The linear nature of the logit model requires that the effects of each partner's democracy scores be additive. The

contour plots implied by the NN model, given in Figure 3, show that the pacific effect of democracy is nil when the ex ante probability of conflict is low but is strong when the probability is high. In the latter case, the maximal influence of a movement on the democracy scale is about 40 points, much larger than any effect found in the logit analysis. The nonmonotonicity and nonadditivity allowed by the NN model reveals that the pacific effects are strongest when both partners score high on the democracy scale and are much smaller substantively in the rest of the plot. Interestingly, the most quarrelsome dyads are those in which both partners have a middling democracy score.¹⁸

Dyads containing an extreme autocracy are more likely to fight than are very democratic dyads, but they are less likely to fight than dyads with middling democracy. This effect is found only in the NN analysis, which both allows for massive interactions and nonmonotonic effects of individual variables. In other words, democracy does have pacific effects, but only among dyads that are otherwise likely to be conflictual and only among the most democratic nations. A portion of that effect is strong enough to emerge even in the logit model, which averages small and large effects, but its substantial influence is seen only in the NN analysis. Thus, democratic peace theorists such as Maoz and Russett (1994) appear to be right, although they heavily underestimate the pacific effect when democracy is important and overestimate it in cases in which democracy matters little.

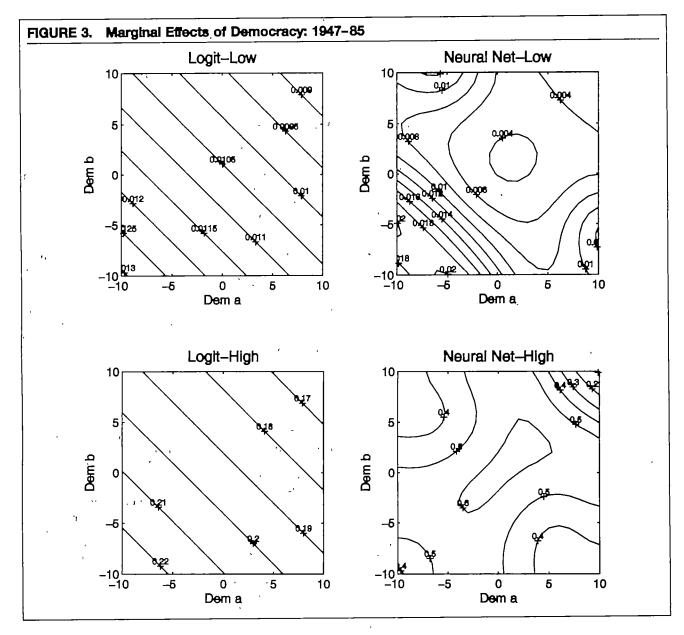

The simple plots we provide here cannot, of course, demonstrate the full structure of the neural network or its power. That is more clearly shown in its ability to forecast disputes much better than any linear or additive analysis. Yet, these plots do show that our results are stronger than those found by more standard methods and that neural nets can find contingent causal structures missed by the simpler, uncontingent, logit model.

CONCLUDING REMARKS

We have proposed a simple conjecture that appears to explain a significant and well-known problem with international conflict studies. The conjecture is consistent with a variety of implications we can observe from the literature. It also suggests a set of specific problems with the most common statistical model used in the field. To evaluate our conjecture, we adapted a statistical model that better matches the features of our conjecture and, as a consequence, the substantive concerns of quantitative and qualitative researchers. The result is a superior statistical model of international conflict. It appears to be the only large-N statistical model that estimates the probability of any international conflict at some level higher than 0.50

¹⁷ As a diagnostic, we also applied generalized additive models to the data. GAMs reveal nonmonotonic effects for these two variables, but their influence, which is averaged over all cases, is substantively much smaller than the effects found by the neural net for the high ex ante probability cases. Furthermore, the GAM effects, which are the "average" of the NN effects over all combinations of the other independent variables, are dissimilar to the NN effects shown. This must be the case if the NN effects at the differing combinations of the independent variables are different; the GAM cannot accommodate this. Of course, logit models can be "tricked" into allowing for nonmonotonicities, although these must be specified in advance As with linear regression, in practice it is hard to get good logit estimates of nonmonotonic effects because of multicolinearity and the arbitrariness of nonmonotonic specifications.

¹⁸ In the postwar data there are relatively few dyads in the interior of the plot. Therefore, the confidence intervals, which would be difficult to show in this type of graph, are much wider in the middle region. Since the confidence intervals for Figure 3 are a function of several model parameters, they would be most easily computed using the simulation technique described in King, Tomz, and Wittenberg 2000.

(ours exceeds 0.90 for some cases). We are able to predict about 17% of conflicts from data on the years prior to the conflict.

This forecasting result can only be driven by an underlying structure of international politics that stays relatively stable over time. Confirming the existence of and understanding this structure has been a holy grail in quantitative conflict studies, and we believe our neural network approach represents progress toward this goal. Along with the graphical tools we introduce, these models may have the potential to uncover structure in other areas.

Neural networks are computationally and intellectually complex, but they are no more than extensions of standard interactive models. While early neural network research often seemed to overfit the data, new Bayesian analysis can surmount much of that problem. It seems unlikely that the effect of any variable commonly used in the field is completely independent of the levels of other variables, as standard approaches

assume. Neural networks are designed to unlock such complicated structures. There is no question that they do a wonderful job of recognizing patterns in other disciplines, but they also can find complicated structural regularities in standard international relations conflict data.

APPENDIX: BAYESIAN METHODS FOR NEURAL NETWORK MODELS

The Model

The basic neural network model we estimate is given in equation 3. To it we add a standard Bayesian setup to shrink the parameter space.¹⁹ We do this by adding two levels of hierarchy. First, we assume independent normal distributions $N(0, 1/\alpha_k)$ for each group of the parameters (and hence the

¹⁹ The explanatory variables are normalized before being input to the neural net to improve computational accuracy. All interpretations in this article are based on the original, unnormalized measures.

index h), with one for the constant terms β_0 , one for each element of β other than β_0 , and one for the set of elements of γ . In addition, for each of the α_k elements, which control how strongly any parameter is influenced by its prior to be small, we assume an (uninformative) improper uniform prior distribution (which is one way of expressing a degree of ignorance or uncertainty about which values are more or less likely).

As discussed in the text, we select M in the model by comparing the test set performance of models with different M's. M should be large enough for the model to be adequately complex and is theoretically unrestricted in magnitude in the Bayesian setting. In the interest of model parsimony and computational efficiency/feasibility, we follow the general practice of searching for the smallest possible M that gives satisfactory performance and restricting the total number of parameters in the resulting model (M(k + 2) + 1, where k is the number of independent variables) to not exceed n/10. To this end we experimented with M set at 5, 10, 15, 20, 25, 30, 35, 40, 50.20 Since the test/validation set performance of models with M around 25 was obviously better than around 20, and an M larger than 25 did not yield significant improvement, we set M at 25.21

The Posterior Distribution of the Parameters

By Bayes's theorem, the posterior distribution is, of course, the product of the prior distributions and the likelihood function:

$$P(\gamma, \beta, \alpha | Y) \propto \left(\prod_{k=1}^{k+2} N(0, 1/\alpha_k) \right) \left(\prod_{i=1}^{n} \pi_i^{Y_i} (1 - \pi_i)^{1-Y_i} \right), \tag{4}$$

where π_i , the probability of conflict, is defined in the second and third lines of equation 3.22

Ideally, we would be able to draw random samples of γ , β , and σ directly from this posterior distribution to compute quantities of interest. Indeed, this has been accomplished with a hybrid version of Markov Chain Monte Carlo (MCMC) methods (Neal 1996). Yet, runs that provide exact draws from the posterior with MCMC methods take an inordinately long time to complete. The method also has all the usual problems caused by a lack of agreement on how to assess stochastic convergence in MCMC algorithms.

After trying Neal's approach, we felt that more time to experiment with different specifications to understand the data was necessary, so we adopted the normal approximation approach (MacKay 1992a, 1992b, 1992c, 1994).²³ It approximates the posterior distribution of the model parameters as multivariate normal, which makes analytic solutions possible. As in standard maximum likelihood estimation, the variance matrix of the parameter estimates is found by inverting the Hessian.²⁴

Posterior Probabilities of Conflict

One of our goals is to generate forecasts of international conflict. The other is to see how these forecasts would change in accord with various configurations of the explanatory variables, X_i . For both goals, we need to specify the posterior probability of the forecasts.

Conceptually, computing the forecast posterior is simple and in principle can be accomplished by the usual simulation methods that apply to virtually every other statistical model (see King, Tomz, and Wittenberg 2000). That is, draw random samples of β , γ , and α from their posterior distribution in equation 4 (or their asymptotic normal approximation), insert them into the functional form in the second and third lines of equation 3 to compute π_i , and take a random draw from a Bernoulli distribution with this parameter (the first line of equation 3). In practice, we use MacKay's (1994) faster analytical approximations to accomplish the same task.

The Data

The data set used here was provided by Richard Tucker (1997), and corresponds to the data used in Beck and Tucker (1998). The data set consists of observations on PRDs from 1947-89 (or a shorter period if earlier data was either not available or the dyad became a PRD after 1947, usually because one partner became independent later than 1947). The peace years variable until the first dispute was coded as the time since a dyad became a PRD, that is, the first year a dyad was at risk of a dispute was the year it became a PRD. Dyads that involved a major power in a region in which it had little or no interest (e.g., China in Latin America) were excluded; operational rules for this exclusion are in Tucker (1997). Note that excluding these dyads affects the affinity measure. These coding rules yielded 23,529 dyad-years. Both alliance data (for the similarity measure) and national capabilities data (for the asymmetry measure) were taken from data sets created by the Correlates of War project; this project also defined the domain of nation states which were used to construct the PRDs. The actual alliance data were provided by J. David Singer, the capabilities data were from Singer and Small 1993 and the system membership data were taken from the Peace Science Society (International) web site (http://pss.la.psu.edu/DATARES.HTM).

Coordination, Moderation, and Institutional Balancing in American Presidential and House Elections

WALTER R. MEBANE, JR. Cornell University

oters have been coordinating their choices for president and House of Representatives in recent presidential election years, with each voter using a strategy that features policy moderation. Coordination is defined as a noncooperative rational expectations equilibrium among voters, in which each voter has both common knowledge and private information about the election outcome. Stochastic choice models estimated using individual-level NES data from 1976–96 support coordination versus a model in which voters act nonstrategically to moderate policy. The empirical coordinating model satisfies the fixed-point condition that defines the common knowledge expectation voters have about the outcome in the theoretical equilibrium. The proportion of voters who split their ticket in order to balance the House with the president has been small but large enough to affect election outcomes. Moderation has usually been based on voters' expectations that the president will be at least an equal of the House in determining postelection policy.

o Americans coordinate their votes for president and for Congress? Suppose a voter knows that policy outcomes are compromises between the positions taken by the president and Congress and believes the two political parties push for distinct policy alternatives. Then the voter believes that different combinations of party control of the presidency and Congress will produce different policy outcomes. If the voter cares about the policy outcomes, then the voter's choices among candidates should depend on the combination of party control the choices will help bring about. Some voters would do best to vote a party-line, straight ticket, while others would do best to split their ticket to try to bring about a "moderate" policy outcome, that is, an outcome in some sense between the parties' positions (Alesina and Rosenthal 1989, 1995, 1996; Fiorina 1988, 1992, 73-81; Ingberman and Villani 1993). To cast the most effective vote, each voter should consider how likely it is that the election will produce each possible combination of party control. Coordination occurs when each voter makes the best possible assessment of what the election outcome will be and then uses that assessment to choose candidates in the way most likely to produce the best possible result for the voter.

Moderation does not necessarily imply coordination.

Walter R. Mebane, Jr., is Associate Professor of Government, Cornell University, Ithaca, NY 14853-4601 (wm1@cornell.edu).

Earlier versions of this paper were presented at the 1998 Summer Methods Conference, University of California, San Diego, July 23-26; 1998 annual meeting of the Midwest Political Science Association, April 23-25, Chicago, IL; and 1997 Summer Methods Conference, Ohio State University, Columbus, July 24-27. I worked on the paper while vanting during fall 1997 at the Department of Social and Decision Sciences at Carnegle Mellon University, at the invitation of Bill Keech. I thank Jasjeet Sekhon, Jonathan Wand, Jonathan Cowden, and Matthew Wexler for helpful comments, Jonathan Cowden and Jasjeet Sekhon for letting tron and lapo help macht with the computing, and Jonathan Hoffman for assistance in preparing the final copy of the manuscript. Data were made available m part by the Cornell Institute for Social and Economic Research and the Inter-University Consortium for Political and Social Research. All errors are solely the responsibility of the author. All data and computer programs used to produce results reported in this article are available on the APSR web site.

Moderation refers to the relationship between the policy outcome intended by the voter and the parties' policy positions. There is moderation if the intended policy outcome is an intermediate combination of the parties' positions. Coordination refers to a relationship among different voters' choices among candidates. There is coordination if each voter's choice is in a strategic sense in equilibrium with every other voter's choice. I interpret this to mean three things: Each voter's strategy for choosing among candidates is in equilibrium with every other voter's strategy for choosing among candidates; each voter's beliefs about every other voter's preferences and strategy are compatible with the voter's own strategy; and each voter's beliefs are compatible with every other voter's beliefs.

Coordination among voters is not the same as cooperation among them. In a financial market, economic agents who possess private information and act strategically may coordinate their decisions to buy or sell based on the system of prices that all agents know, without the need for sets of agents to reach binding prior agreements about how to act. The information that the agents have in common may be enough to let the market operate in a state of strategic equilibrium among agents (e.g., Grossman 1989). In the theoretical model I develop in this article, voters do not cooperate; each voter is able to make an equilibrium strategic choice among candidates, in accurate anticipation of the aggregate result of the choices all other voters intend to make, by using information that all voters know. Alesina and Rosenthal's (1989, 1995, 1996) theory of moderation features coordination-each voter's choice depends on an expected election result that everyone knows and that is an equilibrium—but Fiorina's (1988, 1992, 73-81) theory does not (Alesina and Rosenthal 1995, 66-71). In Fiorina's theory, voters do not act strategically at all. Voters act strategically in

¹ Studies of electoral coordination often focus on the "wasted vote" logic of Duverger's Law, which is said to keep the number of parties receiving votes small (e.g., Cox 1997; Fey 1997; Palfrey 1989). I examine coordination that relates not to the number of parties—two are assumed—but to possible moderation in voting for president and the House of Representatives.

Alesina and Rosenthal's treatment, but no one has any private information about the election outcome. In the model developed here, different voters have beliefs about the upcoming election results that are very similar but not exactly the same in equilibrium. The similarity is a result of the common knowledge they have, while the differences that remain are due to private information each voter has about concerns that affect the voter's preferences among candidates.

I use National Election Study (NES) data from presidential election years 1976 through 1996 to estimate a stochastic choice model that closely matches the theoretical model. Based on the empirical results, I argue that in recent years American voters' choices for president and the House of Representatives have been coordinated, with each voter using a strategy that features policy moderation. In both the theoretical model and the empirical model, each voter forms preferences about the candidates based on a personally distinct idea about what the parties' policy positions are. The coordination takes the form of a rational expectations equilibrium among voters. The notion of voter equilibrium here is similar to the concept of a "fulfilled expectations" equilibrium (Kreps 1977) developed for elections by McKelvey and Ordeshook (1984, 1985a, 1985b).²

The models of moderation-with-coordination developed by Alesina and Rosenthal (1989, 1995, 1996) have implications for the midterm loss phenomenon and for election-related fluctuations in economic phenomena such as growth. The latter have been tested using aggregate time-series data, with mostly positive results (Alesina, Londregan, and Rosenthal 1993; Alesina and Rosenthal 1995; Alesina, Roubini, and Cohen 1997).

Evidence that individuals coordinate has been lacking. Several authors report individual-level (Alvarez and Schousen 1993; Born 1994a) or aggregate-level (Burden and Kimball 1998; Frymer 1994) tests aimed at Fiorina's (1988; 1992, 73–81) theory of moderation, with controversially (Born 1994b; Fiorina 1994) negative results. As previously noted, Fiorina's theory does not posit coordination among voters. The tests of his theory have not examined whether voters' expectations about the election outcomes affect their choices. I use the NES data to estimate a stochastic choice model that implements Fiorina's theory and test it against the coordinating model.

The heart of the formal model of coordination that I develop and test empirically is a fixed-point theorem that defines the common knowledge belief that all voters have about the upcoming election results. The election results are summarized in the values of two aggregate statistics: (1) the proportion of the two-party

vote to be cast nationally for Republican candidates for the House and (2) the probability that the Republican presidential candidate will defeat the Democrat. Each voter cares about those values because they affect the loss each voter expects to experience from policies the government will adopt after the election. Each voter chooses among candidates so as to minimize that loss. Therefore, each voter's belief about the aggregate values affects the voter's choices. In general, if there is a single pair of values that every voter believes the aggregate statistics to have and every voter chooses based on that belief, then the aggregate result of all their choices may be expected to differ from the values they all believed. In that case, beliefs and expected actions are inconsistent with one another. The fixedpoint result demonstrates that a pair of aggregate values exists for which there is no such inconsistency: When every voter chooses based on belief in the fixed-point aggregate values, the aggregate result to be expected from all their choices is the very same pair of aggregate values. In that case, beliefs match expected actions. Common knowledge of the fixed-point values is not quite enough to establish an equilibrium, because the common knowledge does not include private information each voter has about the voter's actual choice. If each voter's belief equals the common knowledge values adjusted by amounts that correspond to the voter's choices, then the belief each voter has about the aggregate result is consistent with the choices the voter knows it will make. Despite knowing that every other voter is also acting on the basis of beliefs that differ slightly from the common knowledge values, no voter knows any other voter's private information, and so no voter can do any better than to use the common knowledge values as its aggregate expectation for what everyone else is going to do. Because all voters are situated similarly, it is common knowledge that every voter is forming beliefs in that way. Thus there is an equilibrium in which every voter has a slightly different expectation regarding the upcoming election results.

The fixed-point result that determines what voters' beliefs are in equilibrium in the theoretical model imposes a constraint on the statistical model to be used to estimate the parameters of the model with survey data. The empirical model is defined to correspond as closely as possible to the theoretical model. Both models use the same functional forms for each voter's loss function as well as the same specifications for the statistical distribution of the random disturbances that affect the candidate choices each voter makes. Hence, both models specify the same stochastic choice model for each voter. The special constraint is that the estimates of the parameters of the empirical model must be such that the aggregate election summary statistics estimated from the survey data satisfy the fixed-point condition. Stochastic choice models of electoral behavior have not previously imposed such a constraint, and their introduction here is an important innovation in the empirical model specification. The empirically determined fixed-point values are the estimates for the aggregate values that are common knowledge in equilibrium in the theoretical model. A distinc-

² McKelvey and Ordeshook's (1984, 1985a, 1985b) equilibrium concepts are similar in that they use rational expectations, but they differ technically because their models feature purely spatial utility rather than probabilistic voting, assume the existence of a single policy dimension (although some voters are uninformed about candidates' positions), and have each voter voting for only one office rather than two. Enclow and Hinich's (1982, 1983a, 1983b) probabilistic vote choice models also emphasize voters' expectations regarding other voters' votes.

tion between the empirical and theoretical models is that, because of limitations on what we can observe with survey data, the empirical model treats the fixedpoint values as the belief that every voter has regarding the upcoming election outcome. The empirical model does not refine each voter's belief to take the voter's private information into account.

The theoretical and empirical models use assumptions about what individual voters know that are unquestionably unrealistic and unbelievable. It may help to put both the theory and the empirical findings in what I think is the most productive perspective if I say something about this at the outset. In the Conclusion, I briefly outline how in reality a coordinating voting equilibrium must depend on a collection of institutions to aggregate and broadcast information that the current model treats as common knowledge among voters. My analysis is therefore implicitly conditional on the existence of an appropriate institutional context. In a way that I touch on briefly in the Conclusion,3 I think voters possess a variety of beliefs about things the current model treats as common knowledge; the values that are common knowledge in the current model are more like the mean of the distribution of individuals' beliefs than they are values that every individual actually possesses. Even if the current model correctly characterizes the mean, it understates the variability across individuals.

A MODEL OF COORDINATING VOTING WITH MODERATION

The model treats the election as a game among all voters, assumed to be a large number. Voters act noncooperatively. The model focuses on the choices each voter makes between two candidates for president and two candidates for a House seat. The votes for president occur in the context of the Electoral College. There are many House districts, but each voter votes in only one of them. There are two parties, Democratic and Republican, and each race has one candidate running for each party. Both whether an incumbent is running and the incumbent's party vary over districts. Each voter's preferences regarding pairs of candidates depend on the expected election outcome and, therefore, on the choice strategy every other voter is using. Equilibrium occurs when, given everything each voter knows-including the voter's own intended choice and accurate expectations regarding other voters' strategies-no voter expects to gain by using a different strategy.

The preferences each voter has regarding the candidates are based in part on spatial comparisons between the voter's ideal point and the policies the voter believes will result from various election outcomes. Those policies are functions of the policy position the voter expects each party will act on after the election. The expected postelection policy position for each party is a combination of two positions that may differ: the position the voter associates with the party on the

basis of previous turns in office and previous campaigns, and the position the voter thinks the party's current presidential candidate has adopted. All presidential candidates do not have the same ability to move their parties to the position the candidate supports. For each election, the expected party position is a weighted average of the candidate's position and the prior party position. The more influential the candidate, the greater is the weight of the candidate's position.

I use ϑ_{Di} , ϑ_{Ri} , ϑ_{PDi} , and ϑ_{PRi} to denote values in the interval [0, 1] that voter $i, i = 1, \ldots, N$, has in mind at election time for the prior position of the Democratic party (ϑ_{Di}) and Republican party (ϑ_{Ri}) and for the position of the Democratic presidential candidate (ϑ_{PDi}) and Republican presidential candidate (ϑ_{PRi}) . The Democratic positions need not be to the "left" of (i.e., numerically less than) the Republican positions. The policy positions voter i expects the Democratic party and the Republican party to act on after the election are, respectively,

$$\theta_{D_{\mathbf{I}}} = \rho_{D} \vartheta_{PD\mathbf{I}} + (1 - \rho_{D}) \vartheta_{D\mathbf{I}}, \quad 0 \le \rho_{D} \le 1, \quad (1a)$$

$$\theta_{Ri} = \rho_R \vartheta_{PRi} + (1 - \rho_R) \vartheta_{Ri}, \quad 0 \le \rho_R \le 1.$$
 (1b)

If the Democratic party's position is expected to be very close to that of its presidential candidate, then the weight ρ_D is near one. If the Democratic party's position is expected to remain close to its previous value, then ρ_D is near zero. The parameter ρ_R has an analogous relationship to the position voter i expects the Republican party to act on after the election.

The policy expected to result from each possible election outcome depends on four factors: the parties' expected policy positions (just defined); the position expected to be supported in Congress; the president's strength in comparison to the House; and which party's candidate is elected president. To represent the expected position of Congress, I simplify by ignoring both the Senate and all internal structure in the House, such as seats, committees, bills, and rules; the expected position of the House is simply a weighted average of the expected positions of the two parties. Each party's weight is equal to the proportion of the vote that i expects to be cast nationally for the party's House candidates. Using \bar{H}_{l} to denote the expected Republican proportion, the expected position of the House is $\bar{H}_i \theta_{Ri} + (1 - \bar{H}_i) \theta_{Di}$.

The postelection policy expected given any particular value of \bar{H}_l is then a weighted average of the expected position of the House and the expected position of the president's party. The weight of the president represents the president's strength in comparison to the House. For each value of \bar{H}_l there are two expectations for postelection policy, depending on the president's party:

$$\begin{split} \boldsymbol{\delta}_{D_i} &= \alpha_D \boldsymbol{\theta}_{D_i} + (1 - \alpha_D) [\bar{H}_i \boldsymbol{\theta}_{R_i} + (1 - \bar{H}_i) \boldsymbol{\theta}_{D_i}], \\ & 0 \leq \alpha_D \leq 1, \quad \textbf{(2a)} \\ \boldsymbol{\delta}_{R_i} &= \alpha_R \boldsymbol{\theta}_{R_i} + (1 - \alpha_R) [\bar{H}_i \boldsymbol{\theta}_{R_i} + (1 - \bar{H}_i) \boldsymbol{\theta}_{D_i}], \\ & 0 \leq \alpha_R \leq 1. \quad \textbf{(2b)} \end{split}$$

³ See especially note 28.

Policy θ_{Di} is expected to occur if a Democrat is president, and policy θ_{Ri} is expected to occur if a Republican is president. The weights, α_D and α_R , represent the strength a president from each party is expected to have. The value $\alpha_D=1$ means that a Democratic president is expected to dictate policy, so that the legislature would play no role, while $\alpha_D=0$ means that the legislature is expected to determine policy, with the president being irrelevant. The interpretation of α_R is analogous for a Republican president. The functional forms of θ_{Di} , and θ_{Ri} are essentially the same as the simplest policymaking formalism considered by Alesina and Rosenthal (1995, 47–8).

The preference each voter has for each possible election outcome is measured by the loss the voter expects given that outcome. The loss depends on the absolute discrepancy between the voter's ideal point, denoted $\theta_i \in [0, 1]$, and the policy expected given the election outcome: The absolute discrepancy is $|\theta_i - \theta_{Di}|$ with a Democratic president and $|\theta_i - \theta_{Ri}|$ with a Republican president. A voter's expected loss always increases as the absolute discrepancy between the voter's ideal point and the expected policy gets larger.

I use a functional form for the loss that is flexible in two ways. First, an exponent q>0 allows the loss to be a concave (0 < q < 1), linear (q=1), or convex (q>1) function of the absolute discrepancy between θ_i and each expected policy. Second, a variable β_i , $0 < \beta_i < 1$, represents the possibility that voters do not treat the two discrepancies equally. If $\beta_i < \frac{1}{2}$ ($\beta_i = \frac{1}{2}$, $\beta_i > \frac{1}{2}$), voter i weights a discrepancy associated with a Republican president more than (the same as, less than) a discrepancy of the same magnitude associated with a Democratic president. The voter's expected losses with, respectively, a Democratic and a Republican president are

$$\begin{split} \lambda_{D_i} &= \beta_i |\theta_i - \hat{\theta}_{D_i}|^q + \xi_{D_i}, \\ \lambda_{R_i} &= (1 - \beta_i) |\theta_i - \hat{\theta}_{R_i}|^q + \xi_{R_i}, \end{split}$$

where the continuous random variables ξ_{Di} and ξ_{Ri} represent other things besides the policy-related discrepancies that affect the voter's expected loss.

At the time of the election, the voter does not know for sure which candidate will be elected president. I assume that the voter computes an expectation for the expected loss, by using the probability that each candidate will win in a standard expected-value formula. \bar{P}_i denotes voter i's expectation for the probability that the Republican wins. The voter's expected loss is

$$\lambda_{i} = (1 - \bar{P}_{i})\beta_{i}|\theta_{i} - \tilde{\theta}_{Di}|^{q} + \bar{P}_{i}(1 - \beta_{i})|\theta_{i} - \tilde{\theta}_{Ri}|^{q} + \xi_{i},$$
(3)

where $\xi_{i} = (1 - \bar{P}_{i})\xi_{Di} + \bar{P}_{i}\xi_{Ri}$.

The specifications of equations 2a, 2b, and 3 have functional forms that are quite similar to those used by Alesina and Rosenthal (1995), but there is an important difference in what the current model says about the information that voters have. The specifications of equations 2a, 2b, and 3 differ from Alesina and

Rosenthal's (1995) theory in allowing the expected policies θ_{D_i} and θ_{R_i} and the expected election outcomes \bar{H}_i and \bar{P}_i to vary over voters. In the theory of Alesina and Rosenthal (1995, 1996), the expected policies and expected election outcomes have values that all voters have identically in common. The variations in the values over voters in the current model mean that the current model endows voters with private information in a way that the theory of Alesina and Rosenthal (1995, 1996) essentially does not do. The current model, therefore, in an important way generalizes the approach taken by Alesina and Rosenthal (1995, 1996).

A voter chooses the pair of candidates—one candidate for president and one for the House-that minimizes the voter's expected loss, λ_i . I measure the effect on λ_l of choosing any one pair, as follows. Let $\bar{P}_{l,R}$ denote the expected probability that the Republican presidential candidate wins if the voter chooses the Republican, and let $\bar{P}_{i,D}$ denote the probability that the Republican wins if the voter chooses the Democrat. Because the effect of a single voter's choice on P_i is very small, the effect on λ_i of the voter's choosing the Republican presidential candidate rather than the Democrat is well approximated by $(\bar{P}_{i,R} - \bar{P}_{i,D})d\lambda_i/d\bar{P}_i$. If $(\bar{P}_{i,R} - \bar{P}_{i,D})d\lambda_i/d\bar{P}_i$ is positive, then voting for the Republican increases the voter's expected loss. Likewise, let $\bar{H}_{i,R}$ $(\bar{H}_{i,D})$ be the proportion of the national two-party vote received by Republican House candidates if the voter chooses the Republican (Democrat) running in the voter's district. Then $(\bar{H}_{l,R} - \bar{H}_{l,D})d\lambda_i/d\bar{H}_i$ closely approximates the effect on λ_i of the voter's choosing a Republican House candidate. Sums and differences of such quantities measure the effect on λ_i of each of the four possible pairs of candidate choices. I use $\lambda_{i,p,k}$ to denote such a measure of the effect of voter i's choosing the presidential candidate of party p and the House candidate of party h. For simplicity, I ignore the differences in voter population sizes across states. Instead, I assume that $\ddot{P}_{i,R} - \bar{P}_{i,D}$ and $\ddot{H}_{i,R} - \bar{H}_{i,D}$ are constants that are the same for all voters: $b_P = \ddot{P}_{i,R} - \bar{P}_{i,D}$ and $b_H = \bar{H}_{i,R} - \bar{H}_{i,D}$. The effects are

$$\begin{split} \lambda_{i,RR} &= b_P \frac{d\lambda_i}{d\bar{P}_i} + b_H \frac{d\lambda_i}{d\bar{H}_i}, \quad \lambda_{i,RD} = b_P \frac{d\lambda_i}{d\bar{P}_i} - b_H \frac{d\lambda_i}{d\bar{H}_i}, \\ \lambda_{i,DR} &= -b_P \frac{d\lambda_i}{d\bar{P}_i} + b_H \frac{d\lambda_i}{d\bar{H}_i}, \quad \lambda_{i,DD} = -b_P \frac{d\lambda_i}{d\bar{P}_i} - b_H \frac{d\lambda_i}{d\bar{H}_i}. \end{split}$$

Choosing the candidate of party p for president and the candidate of party h for the House increases the voter's expected loss if $\lambda_{i,ph} > 0$ and decreases the voter's expected loss if $\lambda_{i,ph} < 0$.

To compute an explicit rule for the voter's choice, I make two more simplifying assumptions. I assume that β_i is not a function of either \bar{P}_i or \bar{H}_p so that $d\beta_i/d\bar{P}_i =$

⁴ Let $\lambda_{i,R}$ denote voter i's loss if i chooses the Republican candidate, and let $\lambda_{i,D}$ denote the loss if i chooses the Democrat. Obviously, $\lambda_{i,R} - \lambda_{i,D} = (P_{i,R} - P_{i,D})(\lambda_{i,R} - \lambda_{i,D})/(P_{i,R} - P_{i,D})$, if $P_{i,R} - P_{i,D} > 0$. But if $P_{i,R} - P_{i,D}$ is very small, then $(\lambda_{i,R} - \lambda_{i,D})/(P_{i,R} - P_{i,D}) \sim d\lambda_{J}dP_{i}$.

 $d\beta/d\bar{H}_l = 0$. And I assume there are constants b_{HP} and b_{PH} such that $b_{HP} = d\bar{H}/d\bar{P}_l$ and $b_{PH} = d\bar{P}/d\bar{H}_l$. The effects of the possible choices on the voter's expected losses are then

$$\lambda_{t,RR} = (b_P + b_H b_{PH}) w_{Pt} + (b_H + b_P b_{HP}) w_{Ht} + \xi_{RRt},$$
(4a)

$$\lambda_{L,RD} = (b_P - b_H b_{PH}) w_{Pi} + (b_P b_{HP} - b_H) w_{Hi} + \xi_{RDi};$$
(4b)

$$\lambda_{t,DR} = (b_H b_{PH} - b_P) w_{Pt} + (b_H - b_P b_{HP}) w_{Ht} + \xi_{DRi};$$
(4c)

$$\lambda_{t,DD} = -(b_P + b_H b_{PH}) w_{Pt} - (b_H + b_P b_{HP}) w_{Ht} + \xi_{DD},$$
(4d)

with

$$\begin{split} w_{P_l} &= (1 - \beta_l)|\theta_l - \tilde{\theta}_{Rl}|^q - \beta_l|\theta_l - \tilde{\theta}_{D_l}|^q; \\ w_{H_l} &= q(\theta_{D_l} - \theta_{R_l})[(1 - \alpha_R)\bar{P}_l(1 - \beta_l)|\theta_l \\ &- \tilde{\theta}_{R_l}|^{q-1}\operatorname{sgn}(\theta_l - \tilde{\theta}_{R_l}) + (1 - \alpha_D)(1 - \bar{P}_l)\beta_l|\theta_l \\ &- \tilde{\theta}_{D_l}|^{q-1}\operatorname{sgn}(\theta_l' - \tilde{\theta}_{D_l})], \end{split}$$

where $\operatorname{sgn}(x) = -1$ if x < 0, $\operatorname{sgn}(x) = 0$ if x = 0, and $\operatorname{sgn}(x) = 1$ if x > 0. The variables ξ_{RRI} , ξ_{RDI} , ξ_{DRI} , and ξ_{DDI} are defined in Appendix A. The voter's choice rule is: choose the candidate combination that corresponds to the smallest of the four values, $\lambda_{I,RR}$, $\lambda_{I,RD}$, $\lambda_{I,DR}$, and $\lambda_{I,DD}$. If we represent the two candidates the voter chooses by a random variable Y_I that takes values in the choice set $K = \{RR, RD, DR, DD\}$, then we may write the voter's choice rule as

$$Y_{i} = \underset{ph \in \mathcal{K}}{\operatorname{argmin}} \lambda_{i,ph}. \tag{5}$$

Equation 5 defines a strategy for each voter in a large-scale game in which all voters participate. The moves available to each voter are the four possible pairs of candidate choices. I assume that all voters move simultaneously, that each voter plays the game noncooperatively, and that each voter knows that every other voter is playing the game the same way. Both w_{Pl} and w_{Hl} depend directly on the parties' shares of the national House vote (\bar{H}_l) , and w_{Hl} depends directly on the parties' chances of winning the presidency (\bar{P}_l) . The voter's best choice therefore depends on what every other voter is going to do. The strategy defined by equation 5 is an equilibrium if it is the rule that minimizes each voter's expected loss when each voter assumes that everyone else is using the same rule.

For such an equilibrium to exist, each voter must assign values to \bar{H}_i and \bar{P}_i in a way that accurately corresponds to the choices every other voter is likely to make according to equation 5. To be able to do that, each voter must know something about the losses other voters expect to incur from the possible election outcomes. With sufficient information about those losses,

each voter can anticipate what other voters will do in response to each electoral circumstance that may arise. Knowledge of that response pattern allows each i to determine the mutually consistent values of \bar{H}_i and \bar{P}_i . The pair (\bar{H}_i, \bar{P}_i) is mutually consistent if, given everything i knows, i chooses in such a way that—taking i's own choice into account—the proportion Republican that i expects among votes for the House is \bar{H}_i and the probability with which i expects the Republican presidential candidate to win is \bar{P}_i . In equilibrium, all pairs (\bar{H}_i, \bar{P}_i) , $i = 1, \ldots, N$, are mutually consistent.

I assume it is common knowledge (Fudenberg and Tirole 1991, 541-6) that every voter i has an expected loss λ_i as defined by equation 3, and that every i is choosing candidates so as to minimize λ_i . I assume that the common knowledge includes the values of all parameters, including ρ_D , ρ_R , α_D , α_R , q, b_P , b_H , b_{PH} , and any parameters in β_i , ξ_{RRi} , ξ_{RDi} , ξ_{DRi} , or ξ_{DDi} . It is then common knowledge that, for some values of the policy position and other variables, equation 5 is every voter's choice rule.

No voter knows the values of the ideal point, the party or presidential candidate policy positions, or the other variables on the basis of which any other voter is choosing via equation 5. Each voter does know the probability distribution of those values. Let Z_i be an ordered set that includes all the observable variables in $\lambda_{i,RR}$, $\lambda_{i,RD}$, $\lambda_{i,DR}$, and $\lambda_{i,DD}$. That includes θ_i , ϑ_{Di} , ϑ_{Ri} , ϑ_{PDi} , and ϑ_{PRi} ; any variables that make up β_i ; and the component z_{phi} of each ξ_{phi} , $ph \in K$, that may be observed using some generally known technology (e.g., an opinion survey). There are $M \ll$ N mutually exclusive and exhaustive groups of voters, denoted V_k , k = 1, ..., M. For every voter $i \in V_k$, the election-time value of Z_i is generated, independently across individuals, by a process that takes values in a set \tilde{Z} and has unimodal probability measure f_k , $\int_{\tilde{Z}}$ $df_k(Z_i) = 1$. Let ε_{phi} denote the component of ξ_{phi} not covered by Z_i , $ph \in K$. These variables—collectively, the disturbance $\varepsilon_i = (\varepsilon_{RRi}, \varepsilon_{RDi}, \varepsilon_{DRi}, \varepsilon_{DDi})$ —have a joint probability distribution that is the same for every voter. The joint cumulative distribution function is

$$\Pr(\varepsilon_{RR_1} < x_{RR}, \varepsilon_{RD_1} < x_{RD}, \varepsilon_{DR_2} < x_{DR}, \varepsilon_{DD_1} < x_{DD})$$

= $F_{PH}(x_{RR}, x_{RD}, x_{DR}, x_{DD}),$

where F_{PH} is a generalized extreme value (GEV) distribution, independent of each f_k . I assume that M, Z, f_k , $k = 1, \ldots, M$, the number of voters in each group (M_k) , and the fact that ε_i is identically and independently distributed as F_{PH} are all common knowledge.

A GEV distribution arises in a natural way as a model for the disturbance vector ε_r . Suppose that, as

See Maddala 1983 for an introductory discussion of GEV choice models.

⁵ Strictly speaking, to define P_i , with reference to the Electoral College, I will assume that the number of voters in each of the M groups in each state is common knowledge.

time goes by, voter *i* randomly encounters a large number of pieces of information about the alternative candidate pairs but remembers only the best piece of information about each pair. That is, the voter remembers the information about each pair of candidates that makes the loss from that pair seem the smallest. For a wide range of random processes that may generate the information each voter encounters, the distribution of the information the voter remembers about each pair is a GEV distribution (Galambos 1987, 286–314; Resnick 1987, 263–90).

I assume that the pieces of information each voter randomly encounters have a special form of dependence. Information about the two-Republican candidate pair (RR) arrives independently of information about the two-Democrat pair (DD), and the information about those two pairs arrives independently of information about either of the two mixed pairs (RD or DR); but information about one mixed pair does not arrive independently of information about the other mixed pair. In this case, ε_{RRi} is independent of ε_{DDi} , and ε_{RRi} and ε_{DDi} are both independent of ε_{RDi} and ε_{DRi} , but ε_{RDi} and ε_{DRi} vary together. The most natural way to think about this pattern is that a voter accumulates information about each party and also about the possibility of casting a split-ticket vote, but in so doing the voter tends not to distinguish sharply one split-ticket alternative from the other.

To specify the GEV distribution that such a pattern of dependence produces, start by defining

$$x_{RRI} = (b_P + b_H b_{PH}) w_{Pi} + (b_H + b_P b_{HP}) w_{Hi} + z_{RRi};$$
(6a)

$$x_{RDi} = (b_P - b_H b_{PH}) w_{Pi} + (b_P b_{HP} - b_H) w_{Hi} + z_{RDi};$$
(6b)

$$x_{DRi} = (b_H b_{PH} - b_P) w_{Pi} + (b_H - b_P b_{HP}) w_{Hi} + z_{DRi};$$
(6c)

$$x_{DD_i} = -(b_P + b_H b_{PH}) w_{P_i} - (b_H + b_P b_{HP}) w_{H_i} + z_{DD_i}.$$
(63)

Using
$$v_{phi} = \exp\{-x_{phi}\}, ph \in K$$
, define $G_i = v_{RRi} + (v_{RDi}^{1/1-\tau} + v_{DRi}^{1/1-\tau})^{1-\tau} + v_{DDi}, \qquad 0 \le \tau < 1$

Parameter τ measures the dependence between ε_{RDI} and ε_{DRI} . If ε_{RDI} and ε_{DRI} are independent, then $\tau=0$. The GEV distribution function is $F_{PH}(-x_{RRI}, -x_{RDI}, -x_{DRI}, -x_{DDI}) = \exp\{-G_i\}$.

Given Z_i but ε_i known only to have the distribution F_{PH} , the choice rule of equation 5 implies that the probability that voter i chooses each candidate pair is

$$\Pr(Y_i = ph|Z_i) = \frac{v_{phi}}{G_i} \frac{\partial G_i}{\partial v_{phi}}, \quad ph \in K \quad (7)$$

(Börsch-Supan 1990; McFadden 1978; Resnick and Roy 1990). Define $\mu_{phl} = \Pr(Y_l = ph | Z_l)$, $ph \in K$. The probability that i votes Republican for the House is $\eta_i = \mu_{RRi} + \mu_{DRi}$, and for president, $\pi_i = \mu_{RRi} + \mu_{RDi}$.

To characterize the conditions under which mutually consistent pairs (\bar{H}_i, \bar{P}_i) exist when each voter i knows all its own attributes, that is, knows Z_i and ε_i , I first consider what happens when each voter knows only to which group the voter belongs. Because M, M_k , \bar{Z} , f_k , and F_{PH} are common knowledge, no voter then has any information that would produce an expectation about the election outcome different from what the common knowledge would imply. No voter has any relevant private information. Therefore, if a set of mutually consistent pairs exists, the expectations (\bar{H}_i, \bar{P}_i) will be the same for all voters (Aumann 1976; Nielsen et al. 1990). Let (\bar{H}, \bar{P}) denote the common value that all the pairs have in this case.

Knowing only the group V_k to which voter i belongs, and therefore knowing only the range Z and probability measure f_k of the variables in Z_i , every voter determines the same probability for i to choose each candidate pair, by using f_k to integrate over the unknown data:

$$\Pr(Y_i = ph | i \in V_k)$$

$$= \int_{\tilde{Z}} \Pr(Y_i = ph \mid Z_i) df_k(Z_i), \quad ph \in K. \quad (8)$$

Define $\bar{\mu}_{phk} = \Pr(Y_i = ph | i \in V_k)$, $ph \in K$, and $\bar{\eta}_k = \bar{\mu}_{RRk} + \bar{\mu}_{DRk}$. Using f_{k_i} to denote the measure for the group to which i belongs, the expected House outcome is

$$\bar{H} = \underbrace{\int_{\bar{Z}} \cdots \int_{\bar{Z}} \left(N^{-1} \sum_{i=1}^{N} \eta_{i} \right) \prod_{i=1}^{N} df_{k_{i}}(Z_{i}),}_{N \text{ times}}$$

by common knowledge,

$$=N^{-1}\sum_{k=1}^{M}\sum_{i\in\mathcal{V}_{k}}\int_{\tilde{Z}}\eta_{i}\,df_{k}(Z_{i}), \qquad \text{by independence,}$$

$$=\sum_{k=1}^{M}\frac{M_k}{N}\bar{\eta}_k. \tag{9}$$

⁷ It is possible to specify GEV distributions in which there is also dependence among all the pairs that include a candidate from one party. That is, ε_{RR} , ε_{RD} , and ε_{DR} are dependent, or ε_{RD} , ε_{DR} , and ε_{DR} are dependent. In an analysis reported in Mebane 1998, using the same NES data, tests show neither party-based pattern of dependence to be present, as long as party identification is included among the variables in $(z_{RR}$, z_{RD} , z_{DR} , z_{DD}). Given those empirical results, I simplify the current model by ignoring the possibility of party-based dependence.

⁸ To accommodate the combination of continuous and discrete variables that Z_i may contain, the integral in $\Pr(Y_i = ph | i \in V_k)$ may be thought of as a Riemann-Stieltjes, or if necessary Lebesgue-Stieltjes, integral (Billingsley 1986, 230).

The expected probability that the Republican candidate wins the presidency is more complicated, because \bar{P} is the probability that the Republican wins a majority of the Electoral College. Let C_j denote the number of Electoral College votes for state $j, j = 1, \ldots, S$, with $\sum_{j=1}^{S} C_j = C = 538$. Let $C^{[r]}$ denote the set of all subsets s of states such that $\sum_{j \in s} C_j = r$. The expected presidential outcome⁹ is

$$\vec{P} = \frac{\sum_{r=C/2}^{C} \sum_{s \in C^{(r)}} \left(\prod_{j \in s} \bar{y}_{P_j} \right) \left[\prod_{j \notin s} \left(1 - \bar{y}_{P_j} \right) \right]}{\sum_{r=0}^{C} \sum_{s \in C^{(r)}} \left(\prod_{j \in s} \bar{y}_{P_j} \right) \left[\prod_{j \notin s} \left(1 - \bar{y}_{P_j} \right) \right]}, \quad (10)$$

where \bar{y}_{P_j} , defined in Appendix A as a function of $\bar{\pi}_k = \bar{\mu}_{RRk} + \bar{\mu}_{RDk}$, is the probability that the Republican candidate wins a majority of the vote in state j.

I assume that the functional forms of equations 9 and 10 are common knowledge. It then follows that the set of possible values of \bar{H} and \bar{P} is common knowledge. If only the group membership of each voter is known, then the mutual consistency condition requires that the \bar{H} and \bar{P} values must reproduce themselves when they are used to compute the functions $\bar{\mu}_{nhh}$, $ph \in K$, and hence equations 9 and 10. In technical terms, the pair of computed values must be a fixed point of the mapping $[0, 1] \times [0, 1] \rightarrow [0, 1] \times [0, 1]$ that equations 9 and 10 specify. In Appendix A (theorem 2) I show that such a pair (H, P) always exists (except on a set of measure zero). Necessary or sufficient conditions for \bar{H} and \bar{P} to be uniquely determined by the parameters of the model and the measures f_k are not clear.

The result when each voter i knows Z_i and ε_i may be expressed as a collection of small deviations from a fixed point (\bar{H}, \bar{P}) . Let $\bar{\eta}_{k_i}$ and $\bar{\pi}_{k_i}$ denote the group-specific probabilities for the group V_k to which i belongs. Let $\tilde{\mu}_{phi}$ indicate the value of Y_i of equation 5 when voter i knows Z_i and ε_i but for other voters has only the common knowledge: $\tilde{\mu}_{phi} = 1$ if $Y_i = ph$, $\tilde{\mu}_{phi} = 0$ if $Y_i \neq ph$, $ph \in K$. Define $\tilde{\eta}_i = \tilde{\mu}_{RRi} + \tilde{\mu}_{DRi}$ and $\tilde{\pi}_i = \tilde{\mu}_{RRi} + \tilde{\mu}_{RDi}$. The values of $\tilde{\mu}_{phi}$, $ph \in K$, depend on $H_i = H_{i\vec{\eta}_i}$ and $\bar{P}_i = \bar{P}_{l\vec{\eta}_i}$, where $H_{i\vec{\eta}_i}$ and $H_{i\vec{\eta}_i}$ are obtained by replacing one instance of $\tilde{\eta}_{k_i}$ in equation 9 with $\tilde{\eta}_i$ and one instance of $\tilde{\pi}_{k_i}$ in equation 10, via equation 18 (see below), with $\tilde{\pi}_i$:

$$\bar{H}_{i\eta_i} = \bar{H} + (\bar{\eta}_i - \bar{\eta}_k)/N, \qquad (11a)$$

$$\vec{P}_{\mathbf{rf}_i} = \bar{P} + g_i(\tilde{\pi}_i - \bar{\pi}_{\mathbf{k}}), \tag{11b}$$

where $g_i(\cdot)$ is the function that makes the adjustment from \bar{P} , $g_i(0) = 0$. Notice that, because i knows Z_i and ε_i , the vote choice is not random as far as i is concerned: Given \bar{H}_i and \bar{P}_i , one of the four choices in

K will certainly be best according to equation 5.10 An equilibrium set of choices Y_i and expectations (\bar{H}_i, \bar{P}_i) , i = 1, ..., N, is therefore given by the following.

THEOREM 1. There is a coordinating voter equilibrium if, with all voters using the same fixed point (\bar{H}, \bar{P}) computed from common knowledge, each voter i has $(\bar{H}_i, \bar{P}_i) = (\bar{H}_{H_i}, \bar{P}_{i+1})$ and $Y_i = ph$ for whichever of the four possible pairs of values $(\bar{H}_{H_i}, \bar{P}_{i+1})$ produces the smallest value of $\lambda_{i,ph}$, $ph \in K$, where $(\bar{H}_{i1}, \bar{P}_{i1})$ sets $\lambda_{i,RR}$, $(\bar{H}_{i0}, \bar{P}_{i1})$ sets $\lambda_{i,RR}$, $(\bar{H}_{i1}, \bar{P}_{i0})$ sets $\lambda_{i,RR}$, and $(\bar{H}_{i0}, \bar{P}_{i1})$ sets $\lambda_{i,RR}$.

Proof. Plainly the expectations $(\bar{H}_i, \bar{P}_i) = (\bar{H}_{i \uparrow i}, P_{i \uparrow i})$ that minimize $\lambda_{l,ph}$, $ph \in K$, match the choices voter i makes according to equation 5. And while each voter i knows that every other voter i' also has expectations $H_{i'}$ and $\bar{P}_{i'}$ as defined by equations 11a and 11b, \bar{H} and P are the best estimates of the election outcome—not taking into account the choices i will make—available to i in the absence of knowledge of the particular values of $Z_{i'}$ and $\varepsilon_{i'}$: Based on the common knowledge, the expectation of $N^{-1} \sum_{i=1}^{N} (\bar{\eta}_i - \bar{\eta}_{k_i})/N$ is zero, and $N^{-1} \sum_{i=1}^{N} g_i(\bar{\pi}_i - \bar{\pi}_k)$ converges in probability to zero as the size of the population of voters increases;11 there is no information beyond the common knowledge with which to produce estimates that have smaller variance. Since it is common knowledge that all voters are similarly situated (i.e., exchangeable), it is common knowledge that (\bar{H}, \bar{P}) is every voter's best estimate of the election outcome, not counting the voter's own Q.E.D.choices.

A MODEL FOR ESTIMATION WITH SURVEY DATA

For the coordinating voting model to be empirically estimable, the fixed point (\bar{H}, \bar{P}) that is the basis for the voter equilibrium must satisfy a condition of local stability. To understand what is needed, imagine that every voter's belief about (\bar{H}, \bar{P}) undergoes a small perturbation from the fixed-point values, say to $(\bar{H}^{(1)}, \bar{P}^{(1)})$. If each voter uses the perturbed values in equation 8 and hence evaluates equations 9 and 10, the result will in general be values $(\bar{H}^{(2)}, \bar{P}^{(2)}) \neq$

$$\begin{split} \int_{\hat{\mathbf{Z}}} \int_{\mathbf{R}^4} \left(\tilde{\mu}_{\mathbf{j}\mathbf{k}} - \bar{\mu}_{\mathbf{j}\mathbf{k}\mathbf{k}} \right) \, df_{\mathbf{E}}(\mathbf{E}_{\mathbf{i}}) \, df_{\mathbf{k}}(Z_{\mathbf{i}}) &= \int_{\hat{\mathbf{Z}}} \int_{\mathbf{R}^4} \tilde{\mu}_{\mathbf{j}\mathbf{k}} \, df_{\mathbf{E}}(\mathbf{E}_{\mathbf{i}}) df_{\mathbf{k}}(Z_{\mathbf{i}}) \\ &- \bar{\mu}_{\mathbf{j}\mathbf{k}\mathbf{k}\mathbf{k}} \int_{\hat{\mathbf{Z}}} \int_{\mathbf{R}^4} df_{\mathbf{E}}(\mathbf{E}_{\mathbf{k}}) \, df_{\mathbf{k}}(Z_{\mathbf{i}}) = \int_{\hat{\mathbf{Z}}} \mu_{\mathbf{j}\mathbf{k}} \, df_{\mathbf{k}}(Z_{\mathbf{i}}) - \bar{\mu}_{\mathbf{j}\mathbf{k}\mathbf{k}} = 0, \\ ph \in \mathbf{K}, \qquad \iota = 1, \ldots, N \end{split}$$

We have immediately that N^{-1} $\sum_{i=1}^{N}$ $\int_{\mathbf{Z}} \int_{\mathbb{R}^{4}} (\bar{\eta}_{i} - \bar{\eta}_{k_{i}})/N \ df_{\mathbf{z}}(\varepsilon_{i})$ $df_{k}(Z_{i}) = 0$ and, by Slutzsky's theorem based on the continuity of g_{i} and using $\mathbf{M} \ll N$, N^{-1} $\sum_{i=1}^{N}$ $\int_{\mathbf{Z}} \int_{\mathbb{R}^{4}} g_{i}(\mathbf{\hat{\tau}}_{i} - \bar{\pi}_{k_{i}}) \ df_{\mathbf{z}}(\varepsilon_{i}) \ df_{k}(Z_{i}) \stackrel{\Sigma}{\to} 0$.

P is the expected probability that the Republican wins or ties in the Electoral College. I ignore the complications involved in breaking a tie by votes in the House.

¹⁰ An exact tie between two $\lambda_{n,p,h}$ values, $ph \in K$, is a measure zero event that may be ignored.

¹¹ Let f_a denote the density of ϵ , on \mathbb{R}^4 (the real line four times). The

 $(\bar{H}^{(1)}, \bar{P}^{(1)})$. The fixed point (\bar{H}, \bar{P}) is locally stable if a sequence $(\bar{H}^{(1)}, \bar{P}^{(1)})$, $(\bar{H}^{(2)}, \bar{P}^{(2)})$, ... thus produced by repeated cycling through equations 8, 9 and 10 converges to (\bar{H}, \bar{P}) . Perturbations being inevitable, it is easy to see that any equilibrium that occurs in reality must have such a property: even the smallest change would set voters on a path leading rapidly away from any unstable pair (\bar{H}, \bar{P}) .

Assuming that the equilibrium does exist, that the likelihood function that defines the empirical model specification is correct, and that the variables that affect voters' choices in that specification are measured sufficiently well, the stability condition allows an iterative estimation algorithm such as the one described in Appendix A to converge to the parameter estimates that characterize the choices voters make in equilibrium. The need for the computed pair (\bar{H}, \bar{P}) to be a fixed point imposes an additional condition for the estimation algorithm to be judged to have converged. In addition to the usual conditions for having found parameter estimates that maximize the likelihood function, the estimated values (\bar{H}, \bar{P}) must be constant over successive iterations of the estimation algorithm. The requirement from the theoretical model that (H, P) be a fixed point imposes a fixed-point constraint on the maximum likelihood solution.

With NES survey data we can observe the candidate choices Y, reported by each sampled voter i and a number of variables that affect vote choices—a set of variables Z_i . We can use the observed Z_i values and a set of parameter estimates (not necessarily the maximum likelihood estimates [MLEs]) in equation 7 to compute estimated choice probabilities $\hat{\mu}_{phi}$, $ph \in$ K, for each sampled voter, and hence $\hat{\eta}_{k} = \hat{\mu}_{RR} + \hat{\mu}_{DR}$ and $\hat{\pi}_i = \hat{\mu}_{RRi} + \hat{\mu}_{RDi}$. I use such estimated probabilities to compute (H, P) for each set of parameter estimates without having to specify any particular set of groups V_k . The method is to use the sampling weight associated with each voter in each survey to estimate the totals in the formulas for \bar{H} and P. The sampling weight for voter i is proportional to $1/\omega_i$, where ω_i is the probability, determined by the sampling design, that i is included in the sample. Ratio estimates based on such weighted totals implicitly average over groups, without requiring explicit definition of the groups. To compute \hat{H} for a sample of n voters, I use

$$\hat{\bar{H}} = \frac{\sum_{i=1}^{n} \hat{\eta}_{i}/\omega_{i}}{\sum_{i=1}^{n} 1/\omega_{i}},$$
(12)

which is a design-consistent estimator that does not require any group information. 12

I use four different methods to compute \bar{P} , three of

which take the Electoral College into account. Those three methods are based on a ratio estimator of the proportion y_{Pj} of the vote the Republican presidential candidate is expected to win in each state j for which we observe data (NES samples do not have observations from every state). To define the ratio estimator, let \bar{v}_j denote the set of voters in the survey sample from state j. If \bar{v}_j is not empty, then the ratio estimator is

$$\hat{y}_{P_j} = \frac{\sum_{i \in \mathcal{V}_j} \hat{\pi} / \omega_i}{\sum_{i \in \mathcal{V}_i} 1/\omega_i}.$$
 (13)

For the first three methods to compute \hat{P} , I use functions of the \hat{y}_{Pj} values to estimate \bar{y}_{Pj} , the expected probability that the Republican wins a majority of the vote in j and therefore wins all the electoral votes from j. For states from which there are no sample observations $(\bar{v}_j = \emptyset)$, I assign all the electoral votes to the candidate who actually won the state: $\hat{y}_{Pj} = 1$ if the Republican won, and $\hat{y}_{Pj} = 0$ if the Democrat won. Let ζ_R denote the proportion of electoral votes the Republican will win. Given probabilities \hat{y}_{Pj} , its expectation is $\bar{\zeta}_R = \sum_{j=1}^{51} \hat{y}_{Pj} C_j / 538$.

Each of the first three methods uses a different approach to estimate $\Pr(\zeta_R > .5)$. Method one treats g_{Pj} directly as if it were a probability rather than a proportion, setting $\hat{y}_{Pj} = g_{Pj}$, then uses $\hat{\zeta}_R$ directly as the estimate for \bar{P} : With $\hat{y}_{Pj} = g_{Pj}$, for states with sample data, $\bar{P} = \bar{\zeta}_R$. Method two also uses $\hat{y}_{Pj} = g_{Pj}$ but defines \bar{P} as the upper tail of a beta distribution defined to match the variance of ζ_R given \hat{y}_{Pj} ; details are in Appendix A. Method three uses the sampling error of g_{Pj} to estimate $\hat{y}_{Pj} = \Pr(y_{Pj} > 5)$ via a normal approximation. Treating the parameter estimates as fixed numbers, the standard error of g_{Pj} is approximately $g_{pj} = [g_{Pj}(1 - g_{Pj})/(\Sigma_{1 \in V_i} 1/\omega_i)]^{1/2}$. Method three sets $\hat{y}_{Pj} = 1 - \Phi((5 - g_{Pj})/\sigma_{pj})$, where $\Phi(\cdot)$ denotes the standard normal cumulative distribution function, then uses \hat{y}_{Pj} in a normal approximation for $\Pr(\zeta_R > 5)$; details are in Appendix A.

The fourth method ignores the Electoral College and estimates \bar{P} as the simple proportion of votes expected to be received by the Republican: $\hat{P} = (\sum_{i=1}^{n} \frac{1}{\mu_i}/\omega_i)/(\sum_{i=1}^{n} \frac{1}{\omega_i})$. This is tantamount to using the Republican share of the (two-party) popular vote.

For two reasons, (\hat{H}, \hat{P}) is the best we can do to estimate (\bar{H}_i, \bar{P}_i) with survey data. Using $\hat{\eta}_i$ and $\hat{\pi}_i$ to estimate $\bar{\eta}_{k_i}$ and $\bar{\pi}_{k_i}$ in equations 11a and 11b would underestimate the magnitudes of $(\hat{\eta}_i - \bar{\eta}_{k_i})/N$ and $g_i(\hat{\pi}_i - \bar{\pi}_{k_i})$. And with $N > 10^8$, survey samples are too small to detect the effects of the deviations from (\bar{H}, \bar{P}) . For every sampled voter I therefore set $(\hat{H}_i, \hat{P}_i) = (\hat{H}, \hat{P})$.

Given $T \ge 1$ samples each containing n_t observations of the choices Y_t and variables Z_t , with each observation being chosen with probability ω_t from a large population $(\omega_t > 0, i = 1, ..., N_t)$ for each election year t = 1, ..., T, the parameters of the model may be estimated by maximum likelihood. Let

¹² Isaki and Fuller (1982) rigorously develop the relevant concept of consistency. See Sarndal, Swemson, and Wretman (1992, 166-85) for an overview.

 $y_{phi} = 1$ if $Y_i = ph$ and $y_{phi} = 0$ if $Y_i \neq ph$, $ph \in K$. The log-likelihood is

$$L = \sum_{t=1}^{T} \sum_{i=1}^{n_t} \sum_{ph \in K} y_{pht} \log \mu_{pht}. \tag{14}$$

Iterations to estimate the parameter values by maximizing the log-likelihood recompute (H, P) separately for each year at each iteration, as described in Appendix A.

Table 1 displays the principal points of correspondence between the theoretical and empirical models. Both assume the same choice set, K, for each voter. The choices that each voter makes in the theoretical model are assumed to be the choices observed in the survey data. The models use the same definition, equations 6a-6d, for the observable effects that the choices voter i makes have on voter i's loss. Detailed specifications using NES data for equations 6a-6d's variables z_{ph} , $ph \in K$, appear in equations 17a-17d below. The definition of each voter's probability of making each choice, equation 7, is the same in both models. The functional forms for the expected election outcomes differ, due to the need to estimate \bar{H} and \bar{P} from survey samples, but in both models the aggregate statistics satisfy the fixed-point condition that defines the statistics' values as common knowledge in equilibrium in the theoretical model.

TESTS OF COORDINATION

I use two kinds of tests of whether voters coordinate. I check whether the estimated values of particular model parameters satisfy certain conditions necessary for coordination to exist, and I compare the performance of the coordinating voting model to a model that does not have coordination among voters but is otherwise similar.

If the president solely determines policy ($\alpha_D = \alpha_R = 1$), then there is no coordination among voters because $\tilde{\theta}_{Di} = \theta_{Di}$, $\tilde{\theta}_{Ri} = \theta_{Ri}$, and $w_{Hi} = 0$, so that

voters' strategies do not depend on \bar{P}_i or \bar{H}_i . A necessary condition for coordination is, therefore, that at least one of $\alpha_D < 1$ or $\alpha_R < 1$ is true. The test against the specification with $\alpha_D = \alpha_R = 1$ is important also because the constrained model is the familiar kind of model that includes a unidimensional spatial comparison along with nonspatial characteristics: In equations 4a-4d, $w_{Pi} = (1-\beta_i)|\theta_i - \theta_{Ri}|^q - \beta_i|\theta_i - \theta_{Di}|^q$ and $w_{Hi} = 0$. I use confidence interval estimates and likelihood-ratio (LR) tests to check whether the estimates for α_D and α_R differ significantly from the value that annihilates the possibility of coordination.

Other conditions necessary for the choice models to describe coordination are that q>0 and that both b_P and b_H are positive. If q=0, then we have the degenerate values $w_{Hi}=0$ and $w_{Pi}=1-2\beta_i$. If $b_P=b_H=0$, then whatever the discrepancies $|\theta_i-\tilde{\theta}_{Di}|^q$ and $|\theta_i-\tilde{\theta}_{Ri}|^q$ may be, they have no effect on voters' choices. The estimated parameters b_P and b_H do not equal the theoretical differences $\bar{P}_{i,R}-\bar{P}_{i,D}$ and $\bar{H}_{i,R}-\bar{H}_{i,D}$, but they are proportional to those values. So for compatibility with the derivation of $\lambda_{i,ph}$, $ph \in K$, we must have $b_P>0$ and $b_H>0$.

The alternative model to which I compare the coordinating voting model implements Fiorina's (1988; 1992, 73–81) noncoordinating (indeed, nonstrategic) theory of ticket splitting. According to that theory, each voter chooses the mix of party control of the presidency and the legislature—either unified or divided government—that would produce a policy outcome nearest the voter's ideal point, but those choices are not affected by the anticipated election results.

To focus the test as powerfully as possible on the existence or nonexistence of coordination, I formulate the noncoordinating vote choice model to resemble the coordinating model as closely as possible. I replace the terms involving w_{Pi} and w_{Hi} in the coordinating model

¹³ If $\text{var}(e_{phi}) = \frac{1}{6}\pi^2\sigma^2$, $ph \in K$ (see Johnson, Kotz, and Belakrishnan 1995, 12), then the estimated parameters correspond to $b_F = P_{i,R} - P_{i,D}$ and $b_H = H_{i,R} - H_{i,D}$ divided by σ .

with terms that are suitable for the noncoordinating theory but otherwise leave the model unchanged. In particular, for the noncoordinating model, policy outcomes under unified government are θ_{Di} or θ_{Ri} of equations 1a and 1b, while policy outcomes under divided government are

$$\begin{split} & \theta_{DR_i} = \alpha_D \theta_{D_i} + (1 - \alpha_D) \theta_{R_i}, \qquad 0 \le \alpha_D \le 1, \\ & \tilde{\theta}_{RD_i} = \alpha_R \theta_{R_i} + (1 - \alpha_R) \theta_{D_i}, \qquad 0 \le \alpha_R \le 1. \end{split}$$

 $\tilde{\theta}_{DRi}$ is the policy that voter *i* believes will occur with a Democratic president and Republican-controlled House, and $\tilde{\theta}_{RDi}$ is the policy with a Republican president and the House controlled by the Democrats. For the observed attributes of each choice define, instead of equations 6a-6d,

$$\begin{aligned} x_{RRi} &= b_{NC} \beta_{RRi} |\theta_i - \theta_{Ri}|^q + z_{RRi}; \\ x_{RDi} &= b_{NC} \beta_{RDi} |\theta_i - \delta_{RDi}|^q + z_{RDi}; \\ x_{DRi} &= b_{NC} \beta_{DRi} |\theta_i - \delta_{DRi}|^q + z_{DRi}; \\ x_{DDi} &= b_{NC} \beta_{DDi} |\theta_i - \theta_{Di}|^q + z_{DDi}. \end{aligned}$$

where $b_{NC} > 0$, and β_{RRi} , β_{RDi} , β_{DRi} and β_{DDi} are defined in Appendix A.¹⁴ The key feature of the model is that x_{RRi} , x_{RDi} , x_{DRi} , and x_{DDi} are functions of neither the expected Republican House vote proportion (\bar{H}_i) nor the expected probability that the Republican presidential candidate wins (\bar{P}_i) . Nothing in the noncoordinating model makes the choice of voter i depend on the choice or likely choice of any other voter; each voter responds solely to what each believes about the parties and the candidates.

The noncoordinating model has one more free parameter than the coordinating model does, but it does not nest the coordinating model. I use a likelihoodbased method for nonnested hypotheses (Dastoor 1985) to determine which model is superior. Let $L_{\rm C}$ and $L_{
m NC}$ denote, respectively, the log-likelihood functions for the coordinating and noncoordinating models, both having the form of equation 14, and let $L_{\rm C}$ and $L_{
m NC}$ denote, respectively, the values of $L_{
m C}$ and $L_{
m NC}$ computed using the MLEs for each model, estimated separately. If $L_{\rm C} > L_{
m NO}$ a test of whether the noncoordinating model may be rejected in favor of the coordinating model may be based on the MLE of ψ in the log-likelihood function $L_{\text{TEST}} = (1 - \psi)L_{\text{C}} +$ $\psi L_{NO} \ 0 \le \psi \le 1$. If $\hat{\psi}$ is significantly different from one, the noncoordinating model is rejected. If $L_{
m C}$ <

 $L_{
m NC}$ a test of whether the coordinating model may be rejected in favor of the noncoordinating model may be performed by reversing the roles of $L_{
m C}$ and $L_{
m NC}$ in $L_{
m TEST}$. Inability to reject either model may indicate that some voters are coordinating, with behavior best described by $L_{
m C}$ while others are moderating without coordinating, their behavior being best described by $L_{
m NC}$.

DETAILED CHOICE MODEL SPECIFICATIONS

To estimate the models I use data from the NES surveys of 1976, 1980, 1984, 1988, 1992, and 1996 (Miller and Miller 1977; Miller and the National Election Studies 1982, 1986, 1989; Miller et al. 1993; Rosenstone et al. 1997). If I pool the data over all years. Some parameters are constant over all years while others vary over years.

I use the observed responses to several seven-point (and one four-point) NES survey scales to measure θ_i , θ_{Di} , θ_{PDi} , θ_{Ri} , and θ_{PRi} . I use the variables' empirical cumulative distributions to code the responses in the [0, 1] interval. The idea is to make the responses comparable across the substantively different scales by using relative units of measurement. In formulating their theory in terms of a uniform distribution of voters' ideal points, Alesina and Rosenthal (1989; 1995, 22, 86) use relative units: The value of each ideal point and policy position corresponds to the cumulative proportion of support for that position among voters. McKelvey and Ordeshook (1985a) similarly use relative measurement of positions.

The codes I use for the NES scales are to be interpreted as measuring the proportion of all survey respondents who support a position as liberal as or more liberal than the indicated position. Each scale either refers to liberal-conservative ideological labels or pertains to a policy issue. Each of the values θ_i , ϑ_{Di} , ϑ_{Ri} , ϑ_{PDi} , and ϑ_{PRi} averages the values for the named referent-self, Democratic or Republican party, Democratic or Republican presidential candidate—over only the scales for which voter i placed all five referents on the scale. The values for different voters may therefore be computed using different subsets of the substantive scales in each survey. There is no assumption that every voter is using the same substantive policy dimension. Appendix A lists the scales used from each of the surveys and describes in detail the method used to compute codes for each scale.

I specify β_i to be a function of each voter's retrospective evaluation of the national economy. To measure economic evaluations I use a variable, EC_i, that is

¹⁴ Born's (1994a) implementation of Fiorina's theory is similar to the noncoordinating model, the differences being that Born constrains $\alpha_D = \alpha_R$; assumes uncorrelated disturbances ($\tau = 0$); fixes q = 1; uses a single, constant parameter for each of the coefficients here allowed to vary over voters via $b_{NC}\beta_{phi}$, $ph \in K$; measures ideal points and policy positions differently; and includes m z_{phi} variables to measure "Evaluation of President's Job Performance" but not retrospective economic evaluations. Born does not estimate the $\alpha_R = \alpha_D$ parameter simultaneously with the rest of his model but instead repeatedly reestimates the model for several values in the range .5 to .85.

¹⁵ Ingberman and Villani (1993) study a model in which there are both strategic and nonstrategic voters

¹⁶ Data and documentation for 1976-92 are from the "ANES 1948-1994 CD-ROM" of May 1995 (ICPSR CD0010). Data and documentation for 1996 were obtained by ftp from ICPSR in June 1997.

based on responses to a question asking whether the national economy has gotten worse or better over the past year. EC, ranges from -1 to 1; EC, =-1 corresponds to a judgment that the economy is "much worse," and EC, =1 corresponds to a judgment that the economy is "much better" (see Appendix B, 1). The definition of β_i is

$$\beta_i = (1 + \exp\{-b_{E0} - b_{E1}EC_i\})^{-1},$$
 (16)

where b_{E0} and b_{E1} are constants. One reason economic evaluations may affect β_i is that voters may believe a worsening economy calls for increased government intervention to protect or create jobs, or in other ways to help the vulnerable. A voter with such beliefs who thinks economic conditions are worsening may give more of the benefit of the doubt to the party with the stronger reputation for choosing such policies. During 1976-96, the Democratic party had a stronger reputation for choosing interventionist policies than did the Republicans (e.g., Palmer and Sawhill 1984). A voter with the indicated beliefs who thinks economic conditions are worsening may therefore weigh the policy discrepancy associated with a Republican president more heavily than the discrepancy with a Democrat $(\beta_i < .5)$. When economic conditions are improving, presumably it is the Democratic party that receives closer scrutiny ($\beta_i > .5$). Another possibility is that voters believe declining economic conditions call for reduced government intervention, or at least for a reduced rate of expansion, because that is when the country can least afford it. In this case, we should have $\beta_i < .5 \ (\beta_i > .5)$ for voters who think economic conditions are improving (getting worse).

The other observed attributes $(z_{phi}, ph \in K)$ that pertain to the vote choices include retrospective economic evaluations, individual partisanship, and House incumbent advantage.

Many have examined the effects that retrospective economic evaluations may have on vote choices (e.g., Fiorina 1981; Markus 1988). According to Alesina and Rosenthal (1995), such evaluations may be relevant to a voter's choice as an expression of two considerations: the voter's taste for macroeconomic outcomes (pp. 167-71); and the voter's judgment of the competence of the incumbent administration (pp. 191-5).17 Alesina and Rosenthal treat those considerations in the context of particular models that they specify to describe the relationship between output and inflation in the actual economy. The current analysis does not rely on any such model. Rather, I assume that each voter reports its evaluation when responding to the question used to measure EC. I multiply EC, by a variable (PP_i) that changes sign depending on the incumbent president's party: PP, = 1 if Republican; PP, = -1 if Democrat.

Party identification has long been known to affect vote choices, particularly ticket splitting (e.g., Camp-

bell and Miller 1957). Party identification is in part an index of tastes for policy outcomes and of judgments accumulated over time about the competence of the parties' successive administrations (Fiorina 1981; Franklin 1984; Franklin and Jackson 1983; Jackson 1975; Markus and Converse 1979; Page and Jones 1979). People who support different parties also tend to have different policy preferences and perceptions (Brady and Sniderman 1985). I measure party identification with six dummy variables that correspond to the levels of the NES seven-point scale measure of partisanship, using "strong Democrat" as the reference category: PID_{Di}, PID_{ID}, PID_{II}, PID_{IR}, PID_{IR}, and PID_{SRI} (see Appendix B, 2).

To take incumbent advantage into account, I use a pair of dummy variables that indicate whether a Democrat or Republican is running for reelection or whether there is an open seat: $DEM_i = 1$ if a Democrat is running for reelection in individual *i*'s congressional district, otherwise $DEM_i = 0$; $REP_i = 1$ if a Republican incumbent is running, otherwise $REP_i = 0$ (see Appendix B, 3). If $DEM_i = REP_i = 0$, then the district has an open seat. Alesina and Rosenthal (1995) use district-level data for 1950–86 to show that midterm cycle effects predicted by their theory operate pretty much independently of incumbency effects.¹⁸

To understand the functional form I use for z_{phi} , $ph \in K$, recall that in equations 6a-6d an increase in x_{phi} represents an increase in the loss voter i expects from choosing the pair of candidates $ph \in K$. G_i is specified to decrease as x_{phi} increases, via $v_{phi} = \exp\{-x_{phi}\}$, $ph \in K$, so that, by equation 7, the probability that voter i chooses a candidate pair decreases if the loss expected from choosing that pair increases. In equations 6a-6d, an increase in z_{phi} implies an increase in x_{phi} , $ph \in K$. So any variable that should increase the probability of choosing the candidate pair $ph \in K$ and that is included with an additive effect in z_{phi} should have a negative coefficient.

The functional form for z_{phi} , $ph \in K$, is

$$z_{RRt} = -c_{P0} - c_{H0} - c_{REP} REP_{i} - (c_{P1} + c_{H1}) PP_{i}EC_{i}$$

$$- c_{D}PID_{Di} - c_{ID}PID_{IDi} - c_{I}PID_{Ii} - c_{IR}PID_{IR,i}$$

$$- c_{R}PID_{Ri} - c_{SR}PID_{SR,i}; \qquad (17a)$$

$$z_{RDi} = -c_{P0} + c_{H0} - c_{DEM}DEM_{i} - (c_{P1} - c_{H1}) PP_{i}EC_{i}; \qquad (17b)$$

$$z_{DRi} = c_{P0} - c_{H0} - c_{REP}REP_{i} + (c_{P1} - c_{H1}) PP_{i}EC_{i}; \qquad (17c)$$

$$z_{DDi} = c_{P0} + c_{H0} - c_{DEM}DEM_{i} + (c_{P1} + c_{H1}) PP_{i}EC_{i} + c_{D}PID_{Di} + c_{ID}PID_{IDi} + c_{IP}PID_{Ii} + c_{IR}PID_{IR,i}$$

$$+ c_{R}PID_{Ri} + c_{SR}PID_{SR,i}, \qquad (17d)$$

¹⁷ Alesma, Roubini, and Cohen (1997) further review "rational retrospective voting" models.

¹⁸ The district-level analysis is subject to ecological inference biases.

where c_{P0} , c_{P1} , c_{H0} , and c_{H1} are coefficients constant in each year, and c_D , c_{ID} , c_I , c_{IR} , c_R , c_{SR} , c_{DEM} , and c_{REP} are coefficients constant over all years. Coefficient signs should be c_{P0} , $c_{H0} < 0$ and c_{P1} , c_{H1} , c_{DEM} , c_{REP} , c_D , c_{ID} , c_I , c_{IR} , c_R , $c_{SR} > 0$. The following examples help understand the signs expected for the coefficients.

First, consider the effects of party identification. Other things equal, we expect a strong Democrat to suffer a smaller loss from choosing Democratic candidates than from choosing Republican candidates. Ignoring the effects of incumbency and economic evaluations (that is, suppose $c_{REP} = c_{DEM} = c_{P1} = c_{H1} =$ 0), that is so in equations 17a-17d for presidential candidates if $c_{P0} < 0$; in that case $z_{DD_i} < z_{RD_i}$ and $z_{DRi} < z_{RRi}$. Likewise, it is so for House candidates if $c_{H0} < 0$; in that case $z_{DDi} < z_{DRi}$ and $z_{RDi} < z_{RRi}$. Other things equal, a strong Republican should experience a bigger loss from choosing a Democratic candidate than a strong Democrat would experience; hence, $c_{SR} > 0$. In omitting separate effects for the levels of party identification in the specifications for z_{RDI} and z_{DRI} , I am assuming that the partisan effects for presidential candidates are equal to those for House candidates, so that they cancel one another when a voter is evaluating the split-ticket alternatives.

Next consider the effects of incumbency status. Other things equal, the loss from choosing a Democratic House candidate should be smaller when that candidate is an incumbent; hence, $c_{DEM} > 0$. The motivation for $c_{REP} > 0$ is analogous.

Finally, consider the effects of retrospective economic evaluations. If there is a Republican president, one voter who thinks the economy has been going well and another voter who thinks the economy has been going badly, then a simple retrospective voting hypothesis says two things. First, other things equal, the voter who views the economy favorably should experience a smaller loss from choosing Republican candidates than does the voter with the unfavorable view. Second, other things equal, the voter with the more favorable view should experience a larger loss from choosing Democratic candidates than does the other voter. If there is a Republican president, we have $PP_{r} = 1$. A voter who thinks the economy has been getting better has $EC_i >$ 0, while a voter who thinks the economy has been getting worse has $EC_i < 0$. If $c_{P1} > 0$, then the voter with the positive view of the economy has values of z_{RR} , and z_{RD_t} that are more negative than those of the voter with the negative view. The voter with the positive view has values of z_{DRi} and z_{DDi} that are more positive than those of the other voter. If $c_{H1} > 0$, then the values of z_{RRi} and z_{DRi} are more negative for the voter with the positive view of the economy than they are for the other voter, while the values of z_{RD_i} and z_{DD_i} are more positive for the voter with the positive view than they are for the voter who views the economy unfavorably. With a Democratic president we have $PP_i = -1$, so that the orderings of the expected losses, given the voters' opinions about the economy, are reversed.

To measure vote choices Y_i (equivalently y_{phi} , $ph \in K$) I use the postelection choices reported by individuals who said they voted (see Appendix B, 4). The sample size of voters used, pooled over the six NES surveys, is 4,859 (by year, 1976–96, the sizes are 683, 627, 976, 719, 980, 874). Only those who voted for either a Democrat or a Republican for both president and House seat are included. Seven percent of such voters (386/5,245 cases) are omitted because they have data missing due to failure to measure the policy position, economic evaluation, or party identification variables (see Appendix B, 7).

MODEL ESTIMATES AND RESULTS OF TESTS OF COORDINATION

The coordinating and noncoordinating models produce similar results, but the former is superior. MLEs and standard errors (SEs) for the parameters of both models appear in Table 2.19 The coordinating model estimates in Table 2 use method two (beta approximation) to compute P. Most of the parameters that have the same interpretation in both models have statistically indistinguishable estimates. The MLEs for c_{P1} and c_{H1} in each year have the correct signs for the usual kind of retrospective voting effect in which candidates of the president's party lose votes among those who think economic conditions have gotten worse, although not all the estimates are statistically significant. The MLEs for c_{P0} , c_{H0} , c_D , c_{ID} , c_I , c_{IR} , c_R , and c_{SR} are appropriate for the usual effects of party identification—slightly larger in the noncoordinating model. The MLEs for c_{DEM} and c_{REP} point to a substantial incumbent advantage, slightly larger for Republicans than for Democrats. The function β , in the coordinating model and the corresponding functions in the noncoordinating model imply similar patterns of sensitivity to retrospective economic evaluations (discussed below).20 But the coordinating model log-likelihood ($L_{\rm C} = -3186$) is much greater than that of the noncoordinating model ($L_{\rm NC} = -3225$). Using L_{TEST} , the MLE for ψ is $\hat{\psi} = 0$, with a profilelikelihood 95% confidence interval (Barndorff-Nielsen and Cox 1994, 90) of (0, .05). The nonnested hypothesis test clearly rejects the noncoordinating model and does not reject the coordinating model.

For every year except 1976, the coordinating voting model passes the parameter-based tests of the conditions necessary for it to describe coordinating behavior. This entails rejecting the spatial model that arises when $\alpha_D = \alpha_R = 1$. Table 3 reports the LR test statistics for the constraint $\alpha_D = \alpha_R = 1$, imposed separately for

²⁰ Indeed, using the MLEs for each model, $\beta_i = \beta_{DR_i} + \beta_{DD_i}$.

¹⁹ Estimates were computed using SAS, PROC NLIN (SAS Institute 1989–95), with numerical derivatives. Over all years, the percentage correctly classified by "predicting" for each observation the pair of vote choices that has the highest probability using the parameter MLEs is 73.6% (by year: 68.7%, 67.0%, 74.4%, 75.9%, 74.6%, 78.3%). Over all years the average probability of the pair of choices actually made is .64 (by year: .58, .58, .65, .66, .65).

each year. It is rejected in every year except 1976. The 95% confidence intervals shown in Table 4 support the same conclusions. Both the LR tests and the confidence intervals in Table 4 have been adjusted in light of the fact that four parameters have MLEs on a boundary of the parameter space; see the discussion in Appendix A. Regarding the other necessary conditions, 95% confidence intervals computed as in Table 4 show q (.9, 1.1), b_P (3.1, 4.7) and b_H (2.4, 8.3) to be

Log-likelihood values: coordinating model, -3186.1; noncoordinating model, -3226.1.

positive and bounded well away from zero. As the values of $L_{\rm C}$ reported in Table 5 suggest, the coordinating model is superior to the noncoordinating model for all four methods of computing \hat{P} . The \hat{P} values from the beta approximation method are prima facie acceptable in the sense that $\hat{P} < .5$ whenever the Democratic candidate won the presidential race and $\hat{P} > .5$ whenever the Republican candidate won. The normal approximation method values for \hat{P} appear intuitively to be more plausible, in that they are more extreme—closer to zero or one—for

years such as 1984 when prospects for one of the candidates were widely believed to be hopeless. The normal approximation gives $\hat{P} > 5$ for 1976, however, and using the normal approximation produces a substantially more negative value for $\hat{L}_{\rm C}$ indicating a much worse fit to the data, than does the beta approximation method. Both the method that directly uses the expected proportion of electoral votes as \hat{P} and the method that simply uses the expected proportion of individuals votes perform virtually as well as the

²¹ The estimates from the normal approximation method are numerically the closest to the more extreme values that Alesina, Roubini, and Cohen (1997, 114–20, 135–7) obtain by using the statistics of a Brownian motion (running in reverse) to model sequences of Gallup poll results. A key assumption of the Brownian motion model, that the differences between successive polls are independent, is incompatible with the idea that the sequence of polls informs voters about the aggregate distribution of voters' preferences, and therefore it is incompatible with convergence results such as McKelvey and Ordeshook (1985a) and Nielsen et al. (1990) discuss.

TABLE 3. Likelihood-Ratio Test Statistics for the Constraint $\alpha_D = \alpha_R = 1$, by Year

Year	-2(L _{constrained} - L)
1976	1.8
1980	17.0
1984	25.4
1988	16.0
1992	12.8
1996	39.4

Note: The constraint is imposed separately for each year's α_D and α_R parameters. The critical value for a .06-level test using the χ_2^2 distribution is 5.99 (using χ_1^2 , for 1976, the critical value is 3.84).

beta approximation method in terms of their $\hat{L}_{\rm C}$ values. Both have $\hat{P} > .5$ for 1976, however.²²

The results in Table 5 may suggest that voters use proportions instead of probabilities in evaluating weighted averages such as equation 3. Perhaps it would be better to think of equation 3 as representing some kind of expected bargaining outcome, which would parallel the interpretation being applied to $H_i\theta_{Ri}$ + $(1 - \bar{H}_i)\theta_{Di}$ as the expected position of the House, rather than as an expected value. Or it may be, as many studies have suggested, that people do not use probability numbers quite as formal probability theory suggests they should. Note that during the period from September 15 to election day, the average value respondents to the 1984 NES Continuous Monitoring Survey gave for Reagan's chance of winning was .80, a value greater than the electoral vote proportion value $(\bar{P} = .70)$ but smaller than the normal approximation value ($\bar{P} = .93$) (see Appendix B, 8).

MODERATION AND INSTITUTIONAL BALANCING

With expected postelection policies θ_{D_l} and θ_{R_l} defined as in equation 2, moderation is almost always a feature of every voter's choices in the coordinating voting model. Unless $\alpha_D = \alpha_R = 1$, every voter intends to produce a policy outcome that is an intermediate combination of the parties' positions. The estimates for \bar{H} , in Table 5, show the expected position of the House, $\bar{H}\theta_{R_l} + (1 - \bar{H})\theta_{D_l}$, always to have been close to the midpoint between the parties' positions. The House position was expected to be somewhat closer to the Democratic position in 1976, 1984, 1988, and 1992, somewhat closer to the Republican position in 1996, and almost exactly at midpoint in 1980.

Such moderation, which is essentially built into the definitions of $\tilde{\theta}_{Di}$ and $\tilde{\theta}_{Ri}$, has no direct implication for the number of voters who may have been splitting their tickets to try to balance the House position with

that of the future president. One point that bears on the question of such institutional balancing is the fact that the values of \bar{P} and \bar{H} in Table 5 are positively, not negatively, correlated. The productmoment correlation is .09.23 One reason for the positive correlation is suggested by the MLEs for b_{HP} and b_{PH} . The latter is near zero and statistically insignificant, but $b_{HP} = 1.9.24$ Recall that, theoretically, $b_{HP} =$ dH/dP_{ν} , which should be interpreted as a relation among mutually consistent, equilibrium pairs (\bar{H}_i, \bar{P}_i) , $i = 1, \ldots, N$. Indeed, given equations 11a and 11b we have $b_{HP} = dH/dP$, a function of the common knowledge. The positive estimate for the derivative suggests that when the equilibrium value of \bar{P} increases, the value of \bar{H} that is mutually consistent with it tends to increase as well: An increase in the equilibrium expected probability that the Republican will win the presidency induces an increase in the equilibrium expected Republican proportion of the House vote.25 In contrast, the estimate of virtually zero for $b_{PH} =$ $d\bar{P}/d\bar{H}$ suggests that an increase in the expected Republican proportion of the House vote has no effect on the expected probability of a Republican presidential victory. What we have in this asymmetric relationship between expected presidential and House voting outcomes is a presidential coattail effect (Alesina and Rosenthal 1995, 104; Calvert and Ferejohn 1984; Ferejohn and Calvert 1983), most notably a coattail effect that characterizes the relationship between different equilibrium election outcomes.

The positive relationship between \bar{P} and \bar{H} reflects the patterns in which changes have occurred across election periods in ideal points, party positions, partisanship, economic evaluations, and incumbency. To assess the prevalence of balancing behavior, we need to focus on the motivation each voter has that arises solely from the policy-related components of $\lambda_{i,ph}$, $ph \in K$. In the notation of equations 6a-6d, those components are $(x_{phi} - z_{phi})$. Voter i has a policy-based incentive to balance the House with the president (or, equivalently, the president with the House) if one of the two split-ticket alternatives minimizes the policy-related component of the effect the voter's choice has on the voter's expected loss, that is, if $\underset{phi}{\operatorname{argmin}}_{ph \in K}(x_{phi} - z_{phi}) \in \{RD, DR\}$.

A necessary condition for voter i to have a policy-related incentive to balance is that the voter's ideal point falls between the policy positions the voter

²² Except for 1976, the simple vote proportions in Table 5 have values somewhat more extreme than the actual Republican proportion of the two-party popular vote, reflecting the overreporting of votes for the winner that occurs in NES postelection data. In order by year, the actual proportions are .489, .553, .592, .539, .465, and .453 (Miller 1997).

²³ With 1996 omitted, the correlation is .85. These correlations are for the beta approximation value of \tilde{P} . Results for the other methods are similar.

²⁴ The 95% confidence interval for b_{HP} , computed as in Table 4, is (9,2.8). ²⁵ It is important to keep clear that b_{HP} refers to local variations among equilibria. Numerical computations using the NES data and the parameter MLEs of Table 2 show that $\partial \hat{P}_{\ell,j}/\partial j < 0$ and $\partial \hat{H}_{\ell,j}/\partial \ell < 0$ for ℓ , $j \in (0,1)$. Moreover, the values $\hat{P}_{\ell,j} = \ell$ are decreasing in j, and the values $\hat{H}_{\ell,j} = j$ are decreasing in ℓ for ℓ , $j \in (0,1)$ (see Appendix A for the ℓ , j notation). The assumption of global linearity that $b_{HP} = d\hat{H}/d\hat{P}$ reflects is restrictive.

TABLE 4.	95% Confidence In	tervals for $lpha_D$ and $lpha$	$\alpha_{\!R}$		
Parameter	Lower Bound	Upper Bound	Parameter	Lower Bound	Upper Bound

$\alpha_{D.84}$.52	1*	$\alpha_{R.84}$.34	.79
$\alpha_{D,88}$.36	.98	$\alpha_{R.88}$.54	.99
$\alpha_{D,92}$.80	1*	$\alpha_{R,92}$	<i>.</i> 27	.89
$\alpha_{D,96}$.67	1*	$\alpha_{R,96}$	0 *	.66

Note: Estimates are based on tabulation of an asymptotic mixture distribution of the kind derived in Moran (1971) and Self and Liang (1987), under the hypothesis $\alpha_{D,76} = \rho_{D,92} = \rho_{B,90} = \rho_{B,90} = 1$. Asteriek indicates a boundary-constrained value.

expects the parties to act on after the election; that is, either $\theta_{Ri} > \theta_i > \theta_{Di}$ or $\theta_{Di} > \theta_i > \theta_{Ri}$. Table 6 shows the percentage of voters who have such an ordering in each year in the NES data. The figure jumps from 29% in 1976 to 45% in 1980, then varies between 43% and 52% in subsequent years. The number of voters having a policy-related incentive to balance is therefore potentially quite large.

But only a minority of those voters who could have such an incentive, given θ_i , θ_{Di} , and θ_{Ri} , actually do have such an incentive once the presidential candidates' anticipated strengths in relation to the House $(\alpha_D \text{ and } \alpha_R)$ and the expected election outcome (\bar{H}) and P) are taken into account. Table 7 shows the distribution of vote choices that minimize x_{phi} z_{phi} , $ph \in K$, in each year. The voters who have a policy-related incentive to balance are those for whom either $x_{RDi}-z_{RDi}$ or $x_{DRi}-z_{DRi}$ is the smallest of the four values of $x_{phi}-z_{phi}$, $ph\in K$. The percentage of such voters is smaller than 20% in every year and is less than or equal to 10% in three of the six years (1980, 1988, and 1996). Such percentages match the predictions of Alesina and Rosenthal's (1995, 103) theoretical model, in which only a small proportion of the voters who have ideal points between the positions of the parties are predicted to split their tickets in the presidential election year.

Partisanship, economic evaluations, and incumbency frequently outweigh policy-related balancing considerations in the overall determination of whether a voter casts a split-ticket vote. Moreover, the estimate for τ (95% confidence interval (.31, .47)) is large enough to suggest that a fair number of split-ticket votes are significantly motivated by other considerations that either enhance or reduce the appeal of both split-ticket alternatives without sharply distinguishing between them. Of those found to have a policy-related balancing incentive in the NES data, over all years, only 31% actually split their ticket. Only 22% of those who did not have a policy-related balancing incentive split their ticket. The Pearson chi-squared statistic for independence in the cross-classification of split-ticket versus straight-ticket votes by split-ticket versus straightticket policy-related incentives (measured $\operatorname{argmin}_{ph \in K}(x_{phi} - z_{phi})$ is 18.8 with 1 degree of freedom, which indicates a statistically significant association at any conventional test level.²⁶ Factors that may have little or nothing to do with a voter's policy preferences substantially affect the voter's choices. But both the number of voters who have a policy-related balancing incentive and the degree to which that incentive affects their choices are large enough to support a conclusion that policy-related balancing has often been an important determinant of election outcomes.

CONCLUSION

Recent American elections have featured coordination among voters, based on voters' intentions to produce postelection policy moderation between the president and the House. Inspired by policy concerns that have been mediated through a coordination-with-moderation mechanism, a small but significant proportion of voters have been motivated to vote a split ticket in order to increase the chances of institutional balance. Perhaps not in 1976, but in each presidential year election from 1980 through 1996, each voter's choices between the major party candidates for president and the House have been constrained by the anticipated election result, that is, by the aggregate result of the choices all other voters were about to make. In recent elections the strategies and beliefs of different voters have been strongly tied together.

For the most part, moderation has been based on voters' expectations that the president will be at least an equal of the House in determining postelection policy. Most of the α_D and α_R point estimates are greater than .5 (see Table 2), which suggests that voters usually believe the president to have more weight in policy outcomes than does the House. Jimmy Carter running for reelection in 1980 is an exception ($\hat{\alpha}_{D,80}$ = .4), but the most striking case of anticipating a weak president is Bob Dole in 1996 ($\hat{\alpha}_{R,96}$ = .1). One interpretation is that voters expected a Dole presidency to be driven by the centralized and confrontational House of Speaker Newt Gingrich.

²⁶ Overall, the coordinating voting model does not do especially well in classifying split-ticket voters separately from straight-ticket voters. Of the 597 voters "predicted" to split their ticket, 48% did so; of the 1,101 voters who split their ticket, only 26% were "predicted" to do so.

In at least one respect, the moderating mechanism has worked to the disadvantage of Democratic candidates. The estimates for the weight variable β , (see equation 16) suggest that the Democratic party cannot choose policies that are more extreme than those of the Republican party without suffering electoral disadvantage, but the Republican party has often not been similarly restricted. Voters who think economic conditions have worsened treat the discrepancies between their ideal points and the policies they expect will occur with each party's president about equally: Someone who says the economy is "worse" has $\beta_i = .52$, and someone who says "much worse" has $\beta_i = .46.27$ But voters who think economic conditions have improved put much more weight on the discrepancy with a Democratic president: Someone who says the economy is "better" has $\beta_i = .63$, and someone who says "much better" has $\beta_i = .69$. Such a pattern is compatible with voters treating the Democratic party more skeptically in times of prosperity, because of its interventionist reputation, but not giving it any particular advantage when times are tough. Whatever its origin, the asymmetric treatment of the parties means that the Democrats have had less leeway than the Republicans to choose policy positions that are not at the center of the distribution of voters' ideal points.

The coordinating voting model is underdeveloped in at least one crucial respect: The model says nothing about how the equilibrium described by the fixed-point pair (\bar{H}, \bar{P}) and other common knowledge might come about. It is unreasonable to think that voters spontaneously agree on the equilibrium values. Indeed, it is unreasonable to believe that each voter independently keeps track of all the information needed to define and sustain an equilibrium. A coordinating voting equilibrium can exist only if institutions exist that can aggregate and broadcast the information everyone needs to know.

Such institutions exist. McKelvey and Ordeshook

show that polls (1984, 1985a) or interest groups and history (1985b) may support rational expectations voter equilibria even when many voters are poorly informed. It should be possible to build such institutions directly into a model much like the current one, with similar empirical implications but with weaker assumptions about what each voter knows about the distribution of voters. 28 More difficult to model would be an institution that brings everyone to agreement about the current values of the model's parameters. Informally it is reasonable to say that this may happen during the electoral campaign, but it is difficult to say anything specific without invoking assumptions at least as strong as the direct assumption that the parameters are common knowledge. 29

On the whole, it seems reasonable to say that the equilibria here modeled with virtually no institutional foundations are in reality sustained by a collection of institutions that may informally be summarized as "the campaign," "polls," and "pundits." The campaign car-

²⁷ The values for β_i are computed using the MLEs for b_{E0} and b_{E1} .

²⁸ For instance, suppose the decision rule of equation 5 is common knowledge, but no voter knows the distribution of other voters' preferences, that is, no one knows the probability measures f_k or the distribution F_{PH} . If the unknown distributions are such that $\partial P_{\epsilon}/\partial j < 0$ and $\partial H_{\epsilon}/\partial \ell < 0$ for ℓ , $j \in (0, 1)$, then a sequence of preelection polls will converge to a fixed point (H, P). Nielsen et al. (1990) discuss convergence for a scalar aggregate statistic. To achieve convergence to a neighborhood of (H, P), it is not necessary for every voter to learn the result of every poll, nor for every voter to have the same probability of learning about each poll. If under the common knowledge assumptions of the current model the fixed point (H, P) would be unique and stable for the given population of voters, and if each voter has a positive probability of learning about each poll and updates consistently, then Bowden's (1987) results imply that aggregate pre-election poll results evolve according to a Markov process that converges to a stationary distribution with mean (\bar{H}, \bar{P}) . It seems obvious that if each voter uses Bayesian updating based on a suitable likelihood, then the mode of the distribution of each voter's beliefs converges over time to (\bar{H}, \bar{P}) (cf. McKelvey and Page 1990). The process may not converge by the time of any particular election, however.

²⁰ For instance, at least as strong would be an assumption that all voters have a common knowledge prior distribution for the parameters, from which they then update based on public campaign information.

Orderings of Ideal Points and Expected Party Policy Positions, by Year TABLE 6. Ordering θ_{Di} , $\theta_{Ri} > \theta_{i}$ Year $\theta_{D_l} > \theta_l > \theta_{R_l}$ $\theta_{R_l} > \theta_l > \theta_{D_l}$ $\theta_{l} > \theta_{Dl}, \; \theta_{Rl}$ $\theta_{I} = \theta_{DI} = \theta_{RI}$ 53.1 1.0 1976 2.9 25.9 17.1 1980 2.7 42.4 21.0 33.7 0.2 24.9 0.0 1984 1.8 50.5 22.8 -0.3 25.2 46.1 26.6 1988 1.7 2.9 39.7 29.2 27.5 0.8 1992 0.6 1996 3.9 44.0 29.1 22.5

ries the processes through which the expectations here modeled as (\bar{H}, \bar{P}) and the party and governmental struggles here modeled using parameters such as ρ_D , ρ_R , α_D , and α_R converge to equilibrium values. Polls and pundits allow each voter to monitor the expectations and struggles for power as they evolve, without the voter having to exert much personal effort. To learn the candidates' chances in the presidential race and the expected outcome in House races across the country, a voter need only invest a little time listening to pollsters say what they think will happen. Brief attention to media commentators may let a voter know how strong each presidential candidate may be expected to be, if elected, relative to the candidate's party and to the legislature. Having so easily learned the commonly accepted expectations for the election outcome and for the power relationships, all a voter then needs in order to coordinate with all other voters is knowledge of the components of the voter's own personal preferences: the voter's ideal point and what the voter thinks are the relevant policy positions of the parties and candidates; the voter's partisanship and evaluation of the economy; the presence or absence of an incumbent in the House race in the voter's district; and other factors here treated as random. If sufficient institutional support exists, it is not difficult for voters to coordinate.

TABLE 7. Vote Choices That Minimize the Effect on Expected Policy-Related Loss, by Year

APPENDIX A. PROOFS AND TECHNICAL MEASUREMENT ISSUES

Effects of Candidate Choices on a Voter's Expected Loss

Using $d\beta_i/d\bar{P}_i = d\beta_i/d\bar{H}_i = 0$, we have $d\lambda_i/d\bar{P}_i = w_{Pi} + w_{Hi}d\bar{H}_i/d\bar{P}_i + d\xi_i/d\bar{P}_i$ and $d\lambda_i/d\bar{H}_i = w_{Hi} + w_{Pi}d\bar{P}_i/d\bar{H}_i + d\xi_i/d\bar{H}_i$. The other variables used in equations 4a-4d are $\xi_{RRi} = b_P d\xi_i/d\bar{P}_i + b_H d\xi_i/d\bar{H}_i$, $\xi_{RDi} = b_P d\xi_i/d\bar{P}_i - b_H d\xi_i/d\bar{H}_i$, $\xi_{DRi} = -b_P d\xi_i/d\bar{P}_i + b_H d\xi_i/d\bar{H}_i$, and $\xi_{DDi} = -b_P d\xi_i/d\bar{P}_i - b_H d\xi_i/d\bar{H}_i$.

Probability That the Republican Wins the Presidency (Using Only Group Information)

Let V_{jk} be the set and $N_{jk} = |V_{jk}|$ the number of voters in state j who are members of group V_k . $\bar{V}_j = \bigcup_{k=1}^M V_{jk}$ is the set of all voters in state j, and the total number of voters in the state is $N_j = \sum_{k=1}^M N_{jk}$. Let $\bar{V}_j^{(r)}$ denote the set of all subsets of \bar{V}_j of size r. If Z_i is known for all i, then the probability that the Republican gets a majority of the votes in state i is

$$\begin{split} \bar{y}_{J_{j}}^{*} &= \frac{\sum_{r=\lceil N_{j}/2 \rceil}^{N_{j}} \sum_{r \in \bar{V}_{j}^{(*)}} \left(\prod_{r \in s} \pi_{i} \right) \left[\prod_{r \in V_{j} \setminus s} \left(1 - \pi_{i} \right) \right]}{\sum_{r=0}^{N_{j}} \sum_{r \in \bar{V}_{j}^{(*)}} \left(\prod_{r \in s} \pi_{i} \right) \left[\prod_{r \in V_{j} \setminus s} \left(1 - \pi_{i} \right) \right]} \\ &= \frac{\sum_{r=\lceil N_{j}/2 \rceil}^{N_{j}} \sum_{r \in \bar{V}_{j}^{(*)}} \prod_{k=1}^{M} \left(\prod_{r \in s_{k}} \pi_{i} \right) \left[\prod_{r \in V_{jk} \setminus s_{k}} \left(1 - \pi_{i} \right) \right]}{\sum_{r=0}^{N_{j}} \sum_{r \in \bar{V}_{j}^{(*)}} \prod_{k=1}^{M} \left(\prod_{r \in s_{k}} \pi_{i} \right) \left[\prod_{r \in V_{jk} \setminus s_{k}} \left(1 - \pi_{i} \right) \right]}, \\ s_{jk} = s \cap V_{jk}. \end{split}$$

The probability that the Republican candidate gets half or more of the Electoral College votes is

$$\bar{P}^{\star} = \frac{\sum_{r=C/2}^{C} \sum_{s \in C/2} \left(\prod_{j \in s} \bar{y}_{j_{j}}^{\star} \right) \left[\prod_{j \in s} \left(1 - \bar{y}_{j_{j}}^{\star} \right) \right]}{\sum_{r=0}^{C} \sum_{s \in C/2} \left(\prod_{j \in s} \bar{y}_{j_{j}}^{\star} \right) \left[\prod_{j \in s} \left(1 - \bar{y}_{j_{j}}^{\star} \right) \right]}.$$

Replacing each π_l in $\bar{y}_{P_l}^*$ with the group-specific probability $\bar{\pi}_{P_l}$ $i \in V_{P_l}$ gives \bar{P} of equation 10 with

$$\bar{y}_{j,j} = \frac{\sum_{r=[N_j/2]}^{N_j} \sum_{r\in\bar{V}_j^{(r)}} \prod_{k=1}^{M} \bar{\pi}_k^{[s_k]} (1-\bar{\pi}_k)^{[V_{jk}\setminus s_{jk}]}}{\sum_{r=0}^{N_j} \sum_{r\in\bar{V}_j^{(r)}} \prod_{k=1}^{M} \bar{\pi}_k^{[s_k]} (1-\bar{\pi}_k)^{[V_{jk}\setminus s_{jk}]}},$$

$$s_{jk} = s \cap V_{jk}. \tag{18}$$

Since each Z_i is independent and $M \ll N$, Slutzky's theorem implies that $\int_{\bar{Z}} \cdots \int_{\bar{Z}} \bar{P}^* \prod_{i=1}^N df_{k_i}(Z_i)$ converges in probability to \bar{P} as $N \to \infty$ in any way such that, for every j and k, $N_{jk} \to \infty$ or $N_{jk} = 0$. In terms of asymptotic approximation error.

$$\underbrace{\int_{\bar{Z}} \cdots \int_{\bar{Z}} \bar{P}^{+} \prod_{i=1}^{N} df_{k_{i}}(Z_{i}) = \bar{P} + O_{P}\left(\max_{j,k \ N_{jk} \neq 0} N_{jk}^{-1/2}\right)}_{N \text{ times}}.$$

 \bar{P} therefore differs negligibly from $\int_{\bar{Z}} \cdots \int_{\bar{Z}} \bar{P}^{+} \prod_{i=1}^{N} df_{k}(Z_{i})$ if N_{ik} is large for all j and k.

Existence of Fixed-Point Pairs (H, P)

Let Ψ be a bounded set of positive Lebesgue measure that is the parameter space for $\lambda_{\iota,p,h}$, $ph \in K$. Let $\bar{\pi}_{k\ell_J}$ and $\bar{\eta}_{k\ell_J}$ denote the values of $\bar{\pi}_k$ and $\bar{\eta}_k$ when evaluated using $P = \ell$ and $\bar{H} = \mathfrak{J}$ for some $\ell \in [0,1]$ and some $\mathfrak{J} \in [0,1]$. Let \bar{P}_{ℓ_J} denote the value of \bar{P} as defined by equation 10 when $\bar{\pi}_k = \bar{\pi}_{k\ell_J}$, and let \bar{H}_{ℓ_J} denote the value of \bar{H} as defined by equation when $\bar{\eta}_k = \bar{\eta}_{k\ell_J}$.

THEOREM 2. For almost every $\psi \in \Psi$, there exist values ℓ , $j \in (0, 1)$ such that, simultaneously, $P_{\ell_1} = \ell$ and $\bar{H}_{\ell_2} = j$.

Because $\bar{\pi}_{k\ell_1}$ varies continuously as a function of ℓ for each k and P_{ℓ_1} is a continuous function of the $\bar{\pi}_{k\ell_1}$ values, there is at least one fixed point of P_{ℓ_1} as a function of ℓ for each fixed value of j, that is, there is at least one value ℓ such that \bar{P}_{ℓ_1} ℓ . Because $\bar{P}_{0,1} > 0$ and $\bar{P}_{1,1} < 1$, the number of fixed points is odd, except on a subset of Ψ of measure zero. For q>1there is similarly an odd number of fixed points $\bar{H}_{\ell_1} = \jmath$ for each ℓ . If q=1, the step functions in $w_{H_{\ell}}$ imply that H_{ℓ_1} does not vary continuously as a function of j, so if q = 1 there is not necessarily a fixed point $H_{\ell_1} = j$. If 0 < q < 1, then there is a discontinuity at infinity in w_{Hi} , whenever $\theta_i = \theta_{Di}$ or $\theta_i = \theta_{Ri}$. But for a finite number N of voters, the number of points, of discontinuity in both cases is finite.31 So the values of ℓ for which there is no fixed point $H_{\ell_1} = 1$ form a set of measure zero: for any $\varepsilon > 0$ there is a value ℓ' , $|\ell - \ell'|$ $< \varepsilon$, such that there is a fixed point $\bar{H}_{\ell'j} = j$ for some $j \in [0, 1]$ 1]. Now consider the graph of the set of fixed points $P_{\ell_1} = \ell$ as J varies over [0, 1] and the graph of the set of fixed points $\bar{H}_{\ell_1} = 1$ as ℓ varies over [0, 1]. When q > 1 both graphs are continuous and so necessarily intersect. That is, there is necessarily at least one pair of values (ℓ, j) such that $P_{\ell, j} = \ell$ and $H_{\ell_1} = J$. If $0 < q \le 1$, then each graph is in general not continuous, because of the discontinuities in w_{Hi} , but each graph does have a finite number of continuous components. In this case, the graphs need not intersect. But because the number of points of discontinuity is finite, the set of parameter values for which there is no intersection has measure zero. For finite N > 0, the argument holds for arbitrary finite sets of probability measures f_k .

Q.E.D.

Survey-Based Probabilities That the Republican Wins the Presidency (P)

Let C_{NR} denote the number of electoral votes assigned to the Republican according to the $\bar{v}_j = \emptyset$ convention, and let C_{ND} denote the number thus assigned to the Democrat. The proportion of the remaining electoral votes that the Republican needs to win is $\zeta_{\pi} = (269 - C_{NR})/(538 - C_{NR} - C_{ND})$. Beta approximation method. For states with sample data, set $\hat{y}_{P_j} = \hat{y}_{P_j}$. Compute the variance of ζ_R as $\sigma^2_{\xi_R} = (\Sigma_{j-1}^S \ C_j^2)^{-1} \ \Sigma_{j-1}^S \ \hat{y}_{P_j} (1 - \hat{y}_{P_j}) C_j^2$. To evaluate $\Pr(\zeta_R > .5)$, use the beta distribution on [0, 1] obtained by matching moments:

$$\hat{\vec{P}} = \int_{L_{\pi}}^{1} \frac{\zeta_{R}^{p_{1}-1}(1-\zeta_{R})^{p_{2}-1}}{B(p_{1},p_{2})} d\zeta_{R}, \tag{19}$$

where $p_1 = \bar{\zeta}_R^2 (1 - \bar{\zeta}_R)/\sigma_{\xi_R}^2 - \bar{\zeta}_R$ and $p_2 = \bar{\zeta}_R (1 - \bar{\zeta}_R)^2/\sigma_{\xi_R}^2 - (1 - \bar{\zeta}_R)$ match the mean $\bar{\zeta}_R$ and variance $\sigma_{\xi_R}^2$ (Johnson, Kotz, and Balakrishnan 1995, 222), and $B(p_1, p_2)$ denotes the beta function. If $p_1 \leq 0$ or $p_2 \leq 0$, then the beta distribution is inappropriate. Normal approximation method. Set $\hat{y}_{p_1} = 1 - \Phi((.5 - \hat{y}_{p_1})/\sigma_{y_1})$ and evaluate $\Pr(\zeta_R > .5)$ as $\bar{P} = 1 - \Phi((\zeta_R - \bar{\zeta}_R)/\sigma_{\xi_R})$.

Iterative Computation of MLEs and Expectations (\hat{H}, \hat{P})

Given estimates for the parameters and estimates $\hat{H}^{(i)}$ and $\hat{P}^{(i)}$ from iteration step ι , use equation 7 to compute probability values $\hat{\mu}_{PAI}^{(i)}$, $ph \in K$, and then $\hat{\pi}_{i}^{(i)}$ and $\hat{\eta}_{i}^{(i)}$ for each voter. For each state j with $\bar{\nu}_{i} \neq \emptyset$ in the referent year, use equation 13 to compute $\hat{y}_{P_{j}}^{(i)}$ and hence compute an updated estimate $\hat{P}^{(i+1)}$ (e.g., using mean $\bar{\zeta}_{k}^{(i)}$, variance $\sigma_{kk}^{(i)}$, and equation 19). Use equation 12 to estimate $\hat{H}^{(i+1)}$, with n being the total sample size of voters for the referent year. Use $\hat{H}^{(i+1)}$ and $\hat{P}^{(i+1)}$ and the parameter values of step ι to apply one step of Gauss-Newton maximization to the log-likelihood, in order to get new parameter values for use in iteration $\iota + 1$. Iterate until, for successive iterations ι and $\iota + 1$, $(\hat{H}^{(i)}, \hat{P}^{(i)}) = (\hat{H}^{(i+1)}, \hat{P}^{(i+1)})$ and the parameter estimates satisfy the first- and second-order conditions for a local maximum of the log-likelihood. In each Gauss-Newton step, each row of the Jacobian matrix of the parameters is weighted by $1/\omega_{i}$, 3^{2} , $1/\omega_{i}$ is scaled to sum to the total sample size \hat{n} in each year, where \hat{n} includes all survey respondents, both voters and nonvoters (see Appendix B, 5).

For a fixed set of parameter estimates, the sequence $(\hat{H}^{(1)}, \hat{P}^{(1)})$, $(\hat{H}^{(2)}, \hat{P}^{(2)})$, \cdots converges if, to extend the notation of the paragraph on the existence of fixed-point pairs, $\hat{P}_{\ell_{J}}$ is decreasing in J and $\hat{H}_{\ell_{J}}$ is decreasing in ℓ for J, $\ell \in (0, 1)$.

 $^{^{30}}$ Confine $\alpha_D,\,\alpha_R\in[0,\,1).$ As discussed in the text, $\alpha_D=\alpha_R=1$ is incompatible with coordination.

³¹ If the ideal point and policy position variables are continuous, then the set of discontinuous has measure zero.

²² In PROC NLIN I used _WEIGHT_ to weight the Jacobian matrix (SAS Institute 1990, 1148).

Estimates on a Boundary of the Parameter Space

Table 2 shows $\alpha_{D,76}$, $\rho_{D,92}$, $\rho_{R,80}$, and $\rho_{R,96}$ to have MLEs equal to 1.0, on the conceptual boundary of the parameter space. The boundary is not a "natural" boundary (Moran 1971b) for the probability model: $L_{\rm C}$ is a proper (although meaningless) likelihood for values of α_D , ρ_D , or ρ_R outside [0, 1]. The on-boundary values do not imply problems with the consistency of the MLEs (Moran 1971a): The model is identified and the MLEs globally maximize $L_{\rm C}$ subject to $0 \le$ α_D , α_R , ρ_D , $\rho_R \le 1$. But the MLEs' asymptotic distribution is complicated (Moran 1971b; Self and Liang 1987). To regularize the model for the LR tests, in all the constrained models I fix equal to 1.0 the parameters with on-boundary MLEs. With this method the test statistic for $\alpha_{D.76}$ = $\alpha_{R,76} = 1$ has only one degree of freedom. None of the statistics in Table 3 are close to the critical value for a test based on χ_2^2 (χ_1^2 for 1976), so slight variations from χ_2^2 in the statistics' distributions would not change any conclusions. Unfortunately, it is computationally infeasible to bootstrap the LR test statistics.

The asymptotic distribution of the MLEs when parameters fall on a boundary of the parameter space is a mixture of censored multivariate normal distributions (Moran 1971b; Self and Liang 1987). For the coordinating voting model, the hypothesis $\alpha_{D,76} = \rho_{D,92} = \rho_{R,80} = \rho_{R,96} = 1$ implies a distribution that is a mixture of 16 censored distributions. I use a bootstrap (20,000 resamples) of the score vectors associated with the MLEs of Table 2 to tabulate that mixture distribution and estimate the confidence intervals of Table 4. With a few substantial exceptions (e.g., $\alpha_{R,88}$) the confidence intervals do not differ greatly from the intervals obtained by using normal theory with the MLEs and SEs in Table 2 (i.e., MLE \pm 1.96 SE).

Comparison Weights in the Noncoordinating Vote Choice Model

The weight of the spatial comparison associated with each form of government is

$$\beta_{j} = \frac{\exp\{-b_{jE0} - b_{jE1}EC_i\}}{1 + \sum_{j' \in [RR,RD,DR]} \exp\{-b_{j'E0} - b_{j'E1}EC_i\}},$$

$$j \in \{RR,RD,DR\}$$

$$\beta_{DD_i} = 1 - \beta_{RRi} - \beta_{RD_i} - \beta_{DR_i}$$

for coefficients b_{jE0} , b_{jE1} , $j \in \{RR, RD, DR\}$. See the text preceding equation 16 for the definition of EC₁. If all forms of government are treated symmetrically, $\beta_{RRi} = \beta_{RDi} = \beta_{DRi} = \beta_{DDi} = \frac{1}{4}$.

Measuring Ideal Points and Policy Positions

To measure θ_i , ϑ_{Di} , ϑ_{PDi} , ϑ_{RD} , ϑ_{RR} , and ϑ_{PRi} , I use a collection of sets of five seven-point (and one set of five four-point) placement scales. Each set includes one scale for self, one for each party, and one for each presidential candidate, all referring to the same substantive policy description (see Appendix B, 6). All scale items are oriented so that the "liberal" position during the given time period has the lower number.

The general motivation for the response codes is the observation that any continuous random variable X can be mapped onto a scale such that the values of the scale have probability mass spread uniformly over [0, 1]. Simply map

each value x of the variable to the value of the variable's distribution function, $F_{\mathcal{X}}(x) = \Pr(X < x)$. If X is multivariate with components X_1, \ldots, X_k , then the mapping from vectors (x_1, \ldots, x_k) to a uniform distribution on [0, 1] may be based on the distribution function $F_{\mathcal{X}}(x) = \Pr(X_1 < x_1, \ldots, X_k < x_k)$. I do not try to estimate the joint, five-dimensional distribution function for the five scales of each substantive description. Rather I crudely approximate the joint distribution by computing the simple average of the observed one-dimensional marginal distributions.

To assign a code in the [0, 1] interval to the response levels of each scale, I first compute the cumulative response proportions for the five scales in the set for each substantive description. Let $0 = r_{sj0} \le r_{sj1} \le \cdots \le r_{sj6} \le r_{sj7} = 1$ denote the successive cumulative proportions for substantive description s (e.g., s = "Liberal/Conservative") and scale $j \in \{S, D, R, PD, PR\}$, S = self, D = Democratic party, R = Republican party, PD = Democratic candidate, and PR = Republican candidate. For each $m \in \{0, \ldots, 7\}$, I compute $r_{sm} = (r_{sSm} + r_{sDm} + r_{sRm} + r_{sPDm} + r_{sPRm})/5$. For all five scales of type s, the numerical code used for original response category $m \in \{1, \ldots, 7\}$ is $\bar{r}_{sm} = (r_{s,m-1} + r_{sm})/2$. To determine values for θ_i , θ_{Di} , θ_{PDi} , θ_{Ri} , and θ_{PRi} for each voter, I average the score for the corresponding scale j over all (and only) the substantive descriptions for which the person responded to all five scales for that substantive description.

APPENDIX B. DATA NOTES

1. Economic Evaluations (EC₁). For 1976 the question wording is: "Would you say that at the present time business conditions are better or worse than they were a year ago?" For 1980, 1984, and 1988 the question wording is: "What about the economy? Would you say that over the past year the nation's economy has gotten better, stayed about the same, or gotten worse?" For 1992 the initial part of the question was changed to read: "How about the economy." For 1996 the initial part was: "Now thinking about the economy in the country as a whole." For all years except 1976, the responses are coded "much worse" (-1), "somewhat worse" (-5), "same" (0), "somewhat better" (5), and "better" (1). For 1976 only three levels of response were recorded, coded here as "worse now" (-5), "about the same" (0), and "better now" (5). The NES variable numbers for each year are 3139 (1976), 150 (1980), 228 (1984), 244 (1988), 3532 (1992), and 960386 (1996).

2. Party Identification (PID_{Di}, PID_{ID}, PID_{ID}, PID_{IR}, PID_I

3. Incumbency Status (DEM₁, REP₁). For 1976, incumbency status variables were built from note 17 in the codebook file nes1976.cbk. The variable numbers for the other years are 740 (1980), 59 (1984), 50 (1988), 3021 (1992; with errors corrected as indicated in the codebook file nes92int.cbk), and 960097 (1996).

4. Vote Choices (y_{ph}). The variable numbers are 3665 and 3673 (1976), 994 and 998 (1980), 788 and 793 (1984), 763 and 768 (1988), 5609 and 5623 (1992), and 961082 and 961089 (1996).

5. Sampling Weights $(1/\omega_i)$. In the NES data, $1/\omega_i$ is the number of adults in each household, which is multiplied by a time-series weight in years (1976, 1992, 1996) when part of

the sample belonged to a multiyear panel cohort. I rescaled the number of adults and time-series weight variables to give each a mean of 1.0 over the whole of each survey sample. The variable numbers are 3003 and 3021 (1976); 43 (1980); 70 (1984); 91 (1988); 29, 3076, and 7000 (1992); and 960046A and 960005 (1996).

6. Placement Scales $(\theta_i, \vartheta_{Di}, \vartheta_{PDi}, \vartheta_{Ri}, \vartheta_{PRi})$. Here are the brief substantive description and variable numbers for each set of scales for each year. The label "reversed" indicates an item whose categories were reordered to reverse the original ordering of 1 to 7 (or for Abortion in 1996, 1 to 4). 1976: Government Guaranteed Job and Living Standard, 3241-5; Rights of the Accused, 3248-52; School Busing to Achieve Integration, 3257–61; Government Aid to Minorities, 3264-8; Government Medical Insurance Plan, 3273-7; Liberal/Conservative Views, 3286–90; Government Guaranteed Job and Living Standard, 3758-62; Urban Unrest, 3767-71; Legalization of Marijuana, 3772-6; Change in Tax Rate, 3779–83; and Equal Rights for Women, 3787–91. 1980: Liberal/Conservative, 267-9, 278, 279; Defense Spending, 281-3, 286, 287; Government Services/Spending (reversed), 291-3, 296, 297; Reduce Inflation/Reduce Unemployment (reversed), 301-3, 306, 307; Liberal/Conservative Views, 1037-9, 1053, 1054; Government Aid to Minorities, 1062-4, 1073, 1074; Getting Along with Russia, 1078-80, 1089, 1090; Equal Rights for Women, 1094-6, 1105, 1106; and Government Guaranteed Job and Living Standard, 1110-2, 1121, 1122. 1984: Liberal/Conservative Placement, 119-21, 123-5, 127-9, 131-3, 135-7; Liberal/Conservative, 369, 371-4; Government Services/Spending (reversed), 375-9; Minority Aid/No Aid, 382-6; Involvement in Central America (reversed), 388-92; Defense Spending, 395-9; Social/Economic Status of Women, 401–5; Cooperation with Russia, 408–12; and Guaranteed Standard of Living/Job, 414-8. 1988: Liberal/Conservative, 228, 231, 232, 234, 235; Government Services/Spending (reversed), 302-4, 307, 308; Defense Spending, 310-2, 315, 316; Government-Funded Insurance, 318-22; Guaranteed Standard of Living/Job, 323-5, 328, 329; Social/Economic Status of Blacks, 332-4, 337, 338; Social/ Economic Status of Minorities, 340-2, 345, 346; Cooperation with Russia, 368-70, 373, 374; and Women's Rights, 387-91. 1992: Ideological Placement, 3509, 3514, 3515, 3517, 3518; Government Services/Spending (reversed), 3701–5; Defense Spending, 3707-11; and Job Assurance, 3718-22. 1996 (omitting the variable number prefix 960): Liberal/Conservative, 365, 369, 371, 379, 380; Government Services/Spending (reversed), 450, 453, 455, 461, 462; Defense Spending, 463, 466, 469, 477, 478; Abortion (reversed), 503, 506, 509, 517, 518; Jobs/Environment, 523, 526, 529, 535, 536; and Environmental Regulation, 537, 538, 539, 541, 542,

7. Missing Data. The loss of cases from ignoring third-party votes substantially affects only presidential votes. Among the 7,198 cases in which any vote cast was for a Democrat or a Republican, 1,426 cast a vote for only one office (either president or House member). Among the 5,772 who said they voted for Democratic or Republican candidates for both offices, 527 were excluded because the incumbent in their district was unopposed. Of the remaining cases, 379 were missing data for the ideal point, policy positions or economic evaluation (295 missing only one or more position variables, 58 missing only EC, 26 missing both); seven more cases were missing data for party identification.

8. Reagan's Chance of Winning. The Continuous Monitoring Survey is Miller and the National Election Studies (1985). The item wording (var. 1001) is: "As you know, Ronald Reagan has been nominated by the Republican party. What chance do you think he has of winning the 1984 presidential election? We will use a scale that goes from 0 to 100 where 0

represents NO chance of winning the presidency, 50 represents an even chance, and 100 represents certain victory." In computing the mean I weighted observations in proportion to the number of adults (var. 16) and in inverse proportion to the number of nonbusiness telephones (vars. 1129, 1131, 1133) in the household. The text reports the mean divided by 100.

Senate Representation and Coalition Building in Distributive Politics

FRANCES E. LEE Case Western Reserve University

The Senate's equal representation of states shapes coalition building in distributive politics. The great variation in state population means that some states have far greater need for federal funds than others, but all senators have equal voting weight. As a result, even though all senators' votes are of equal value to the coalition builder, they are not of equal "price." Coalition builders can include benefits for small states at considerably less expense to program budgets than comparable benefits for more populous states. Building on formal models of coalition building, two hypotheses are developed and tested. First, coalition builders will seek out less costly members to build supportive coalitions efficiently. Second, the final outcomes of distributive policy will more closely reflect the preferences of small-state senators than large-state senators. The hypotheses are tested by examining the 1991 and 1997–98 reauthorizations of federal surface transportation programs. The findings support both hypotheses.

Mr. President, I am not here asking that Arizona receive something extra, unlike a lot of people who are still negotiating in the cloakroom here. I am not asking for money for special projects. But I am asking why it is that the donor States—the States that send more than they receive—can't eventually hope to get some equity in this program. . . This reminds me a little bit of the "Animal Farm" story of George Orwell of 1946. It turns out that all the animals in the barnyard were equal, except that some were more equal than others. That is the way it is with the States of the Union here.

—Senator Jon Kyl (R-AZ), Congressional Record, May 22, 1998, \$5399

The frustration expressed by Senator Jon Kyl, suggesting that some states are "more equal than others," is in one important sense correct. Although all states are represented equally in the Senate, they differ widely in population. At the extremes, Wyoming has a population smaller than most congressional districts, whereas California is more populous than many nations. Such differences mean that states also vary greatly in their need for federal funds. The cost of governmental programs, after all, largely depends on the number of people served by them, notwithstanding some economies of scale. Despite differences in need for federal funds, however, each state has equal representational power in the Senate. This article investigates how apportionment shapes the politics of distributive policymaking in the Senate. This issue has been overlooked in the congressional literature, even though scholars have devoted a great deal of study to the ways institutional structures—such as the distribution of power through the committee and party leadership systems shape distributive policy outcomes (Arnold 1979, 1990; Carsey and Rundquist 1999a, 1999b; Ferejohn 1974; Fiorina 1989; Hall and Grofman 1990; Levitt and Snyder 1995; Rundquist and Griffith 1976; Stein and Bickers 1995; Strom 1975;

Frances E. Lee is Assistant Professor of Political Science, Case Western Reserve University, Cleveland, OH 44106-7109.

An earlier version of this paper was presented at the 57th annual meeting of the Midwest Political Science Association in Chicago, IL, April 15-17, 1999. I am grateful for the advice of Rory Austin, Ken Bickers, Sarah Binder, Bob Birkby, John Geer, Jacob Hacker, Emery Lee, Tom Mann, Bruce Oppenheimer, Wendy Schiller, Kevin Smith, Bob Stein, Kent Wesver, Joe White, and the reviewers.

Wilson 1986a, 1986b). While focusing on the effects of internal congressional organization, however, scholars have ignored Senate apportionment, another basic feature of the institution.

Apportionment shapes Senate distributive policymaking for two reasons. First, senators representing small states have more to gain from procuring a given amount of federal dollars than do senators who represent large states (Lee and Oppenheimer 1999, 123–8). A federal grant of \$5 million, for example, has a far greater effect in Wyoming than in California. Such a grant yields greater electoral benefits for senators who represent small states, both in terms of their statewide visibility and the percentage of residents benefited. Senators representing large states, by contrast, have to procure substantially larger sums in order to obtain the same electoral benefits. All else being equal, procuring these larger amounts will be more difficult, especially in times of fiscal restraint. As a result, small-state senators are better positioned to benefit from distributive politics: Put simply, they need fewer federal dollars for their state but enjoy equal representational power. Second, Senate apportionment affects the incentives of coalition builders in distributive policymaking. The tremendous differences in state population create a unique coalition-building dynamic: All senators' votes are of equal value to the coalition builder, but they are not equal in price (Lee and Oppenheimer 1999, 140). Senators who attempt to build winning coalitions within budgetary constraints can accommodate the funding demands of small-state senators at a lower cost than those of large-state senators. As a result, coalition leaders have strong incentives to include senators representing small states in their coalitions.

Research has shown that the representational advantages of small states translate into public policy. Small states receive more per capita across many federal policy areas and in distributive programs generally (Atlas et al. 1995; Lee 1998; Lee and Oppenheimer 1999). As in most distributive programs, this advantage is clearly evident in federal transportation policy. Less populous states receive more federal transportation dollars per capita than more populous states, even after controlling for differences in need for these

funds.¹ Analyses of aggregate budgetary outlays, however, do not examine how apportionment shapes internal Senate politics by influencing the way senators construct distributive coalitions and the funding policies that eventually prevail.

To investigate the effects of Senate apportionment on coalition building in distributive policymaking, I examine the major surface transportation reauthorizations of the 1990s. In 1991 and 1998 Congress overhauled all transportation programs, devising formulas to distribute \$151 billion and \$216 billion, respectively, among the states. The primary issue at stake during these reauthorizations was distributional equity among the states (Dilger 1998). How did Senate coalition leaders build support for their proposals to distribute federal transportation funds? Which states emerged as the winners and losers? To answer these questions, I compare the compositions of the alternative coalitions developed in the Senate and assess which coalitionbuilding efforts were most successful. The data strongly support the hypotheses advanced. I find that coalition leaders in the Senate build coalitions more efficiently by drawing on the support of small-state senators. These efficient coalitions are more successful. In 1991, the more efficient coalition won outright. In 1998, small states exercised a greater influence on the outcome of the legislation, with the final allocations more closely reflecting small-state senators' preferences than those of their large-state colleagues.

BUILDING COALITIONS IN THE SENATE

With very few exceptions (Evans 1994), most of the scholarly work on legislative coalitions has been in formal theory. In game theoretic terms, the Senate politics of writing formulas to distribute federal funds is best conceptualized as a "divide-the-dollars" game, more specifically, as a constant-sum, 2 100-person game with transferable utility. In developing a formula, legislators must choose among alternative proposals for allocating funds, a situation in which one state's gain is another state's loss.

Riker (1962) advanced the famous proposition that

The recent donor-donee state debate over transportation funds is just a way to frame the controversy over transportation spending per capita. The amount a state pays in gas and other times to the Highway Trust Fund is a function of state population. Multivariate regression analysis confirms that the ratio of federal highway dollars a state received to the dollars it paid in taxes to the Highway Trust Fund over the entire post-1956 period is strongly related to state population. Regressing this ratio on state population—while controlling for the number of interstate and primary highway miles in the state—reveals a large negative, statistically significant (p < .001) relationship Less populous states have had a higher ratio of highway receipts to highway taxes than have more populous states (Lee 1997, 195–200).

rational, utility-maximizing players in divide-the-dollars games will form only minimum-winning coalitions. If a given amount is to be divided among the players, then the larger the winning coalition, the smaller is each winner's share. Thus, a minimum-winning subset of any larger-than-minimum-winning coalition will always have incentives to eject superfluous members to maximize the payoff to themselves. Riker's model has proven to be quite resilient, "appearing as either a key prediction or as an essential assumption of almost all formal models of coalition formation" (Groseclose and Snyder 1996, 303).4 Since Riker, however, most scholars studying legislative divide-the-dollars games have focused on the stability of game outcomes—principally on the problem of overcoming majority rule cycles5rather than on the composition of winning coalitions and the distribution of payoffs among their members.6 An exception to this pattern lies in the sequential choice models of Baron and Ferejohn (Baron 1989, 1991, 1995; Baron and Ferejohn 1989a, 1989b). Sequential choice models of divide-the-dollars games modify Riker's conclusions by demonstrating that different types of procedural rules lead to different distributions of funds: Benefits are distributed to minimal majorities under closed rules but to larger-than-minimal majorities under open rules. Given the difficulty of cutting off debate in the contemporary Senate (Binder and Smith 1997), these findings comparing open and closed rules strongly suggest that successful coalitions in the Senate will need to include large majorities indeed.

A key limitation of these formal models is that they do not address the ways in which Senate apportionment shapes coalition building. Formal approaches to coalition building have generally modeled divide-the-dollars games as symmetric, meaning that "the value of a coalition is a function only of the number of players in it" (Hardin 1976, 1203; Shepsle 1974, 506). In symmetric games, the payoff that a coalition can provide to its members is "dependent solely on the size of

² In constant-sum games, the total value of the game always sums to a constant. They are "strategically identical to zero-sum games" (Morrow 1994, 102).

³ Many political games cannot be modeled using the transferable utility assumption, which is only appropriate when "the game concerns the allocation of some set of *m* resources or goods and that coalition members can trade these goods among themselves" (Ordeshook 1986, 317, see also 318–21; Koehler 1984).

⁴ Groseclose and Snyder's model shows that minimum winning coalitions are not always cheapest when vote buyers move sequentially. Their model, however, only applies to attuations in which a legislator who favors the existing policy status quo uses bribes or favors to sway the minimum necessary number of members away from a coalition builder who is seeking to change existing policy. As a result, their model does not apply to a situation such as that faced by senators during funding formula disputes, in which those who favor policy changes and those who favor the status quo must all write reauthorizing legislation in such a way as to "buy" votes (Groseclose and Snyder 1996, 312).

The problem of cycling occurs in divide-the-dollars games because no stable majority prefers any particular way of distributing the funds to every other possible distribution. Plott (1967) and McKelvey (1976) demonstrated that there are no equilibria in multidimensional choice settings (also see Arrow 1951; Buchanan and Tullock 1967; Riker 1982). Drvide-the-dollars games have as many dimensions as players; therefore, legislative voting on this type of policy issue will not, in theory, produce stable allocational outcomes.

⁶ For a review of the literature on majority rule cycles and equilibrium outcomes, see Shepsle and Weingast 1994. Generally speaking, social choice theorists have explored how legislative norms and institutions—including the committee system, party organizations, restrictive rules in voting, and norms of reciprocity—can provide stability and counteract majority-rule cycles.

the coalition, not on the specific persons that make up the coalition" (Ordeshook 1986, 322). As discussed above, however, Senate apportionment means that senators from large and small states demand dramatically different amounts of federal funds. Senate coalition builders will thus find that small-state senators' demands can be accommodated at much lower cost to the coalition. The payoff a coalition can provide its members thus depends on the specific players included, not merely on the number.

Although the existing formal models of coalition building do not readily apply to the Senate, a rational choice framework is very useful for analyzing the writing of formulas to distribute federal funds. It is important to note that statutory formulas determine how most federal domestic assistance funds are distributed (Advisory Commission on Intergovernmental Relations 1995, 14). In writing formulas, senators determine the share of the total funds each state will receive, often without knowing how much money will be appropriated for the program. Senators, like members of Congress generally, perceive that providing particularized benefits to their state advances their reelection interests. Senators take a great deal of interest in the size of their state's share and work hard to make it as large as possible. One perennial coalition leader on transportation formulas, Senator John Warner (R-VA), for example, said simply: "All of us know that fighting for our individual states is that responsibility which is foremost" (Cong. Rec. 1998, S1827).

A successful coalition builder must make the best offer to a large enough group of senators to ensure passage on the Senate floor. From the point of view of rational, utility-maximizing senators, the best offer is the one that allocates a share of the funds to their constituents greater than any other proposal. Former Senator Robert Dole (R-KS) explained how he developed a funding formula by working from these assumptions about senators' behavior:

Under the formula of the chairman of the Appropriations Committee, 33 States received a part of the \$8.2 billion total; in other words, he had 66 votes. My original formula gave more money to only 18 states, so I only had 36 votes. I was 30 short. However, with the able assistance of an overworked master of numbers... we found a way to change this formula, and by this morning I had 54 votes and the distinguished chairman of the Appropriations Committee had 46 votes (Cong. Rec. 1991, S8104).

Dole's point is clear: To produce a winning formula a senator must distribute the funds so that at least a majority of senators will prefer that formula to the existing alternatives. This, Dole observes, is done by giving "the right information to the people downtown," and then "they will give us the right numbers" (Cong. Rec. 1991, S8104). In short, senators strategically choose formula factors (and weights to give them) so that at least a majority of states will receive a larger share of the funds than under the other formulas proposed.

In the Senate, moreover, coalition builders cannot use restrictive rules to protect their proposals from alternatives. As in the example above, the chair of the

Appropriations Committee, Senator Robert Byrd (D-WV) could not protect his proposal from alternatives. Coalition leaders in the Senate, including those who serve on the committees of jurisdiction, usually cannot prevent dissatisfied senators from offering alternative proposals or using their individual prerogatives to obstruct. The successful coalition builder, then, must make the best offer to a very large group of senators. If there is strong opposition to the coalition leader's proposal, even from a small minority of senators, then the coalition will need at least 60 senators who will vote for cloture.

No coalition leader, however, could ever make the best possible offer to a winning supermajority of senators. In theory, given the lack of limits on debate and amendments, senators could endlessly devise new formulas that would distribute more funds to their own state and offer at least 60 senators more than they would receive under any previous proposal; in other words, majority-rule cycling is always a possibility.7 In practice, however, not every senator engages in coalition building on every issue. Senators have limited time, staff, and information. As a result, Hall (1996, 2) concludes: "Participation in Congress is seldom universal," and "it is never equal." Given the obstacles to participation, a limited number of alternative formulas will be offered during any given formula dispute, principally by members of the relevant committee(s)-in the case of transportation formulas, by members of the Senate Committee on Environment and Public Works. Although it is beyond the scope of this project to ascertain the factors that cause senators to become coalition leaders in the first place (see Hall 1996), such limits on participation reduce the incidence of cycling in divide-the-dollars games.

Even if they do not propose alternatives during funding formula disputes, senators will still prefer the formula that offers their state the largest share. Coalition builders almost always provide clear charts designating the share each state will receive, so determining which formula will provide their state the most funds requires virtually no commitment of senators' resources. In their comments on the floor, senators are quite frank about the importance of these charts. Senator Dale Bumpers (D-AR), for example, explained his intention to vote for a formula even though he felt that it was not the best alternative in public policy terms because "it looks as though Arkansas could get around \$50 million a year more. You do not have to be a rocket scientist to know I am going to vote for that" (Cong. Rec. 1991, S7746).

⁷ It is unlikely that Baron and Ferejohn's equilibria would emerge in a legislature with rules like the Senate's because two days must lapse after a cloture petition is filed before a cloture vote can be taken. The Baron and Ferejohn (1989a, 1184) open-rule model, by contrast, specifies that when a member moves the previous question, "the motion is equivalent to bringing the motion on the floor to an immediate vote," thus denying other coalition leaders the chance to build an opposing majority to defeat the measure. Opposing coalition leaders under Senate rules can use the time between filing and voting on a cloture petition to build a coalition that defeats the cloture motion by allocating more funds to members of the cloture-supporting coalition.

In the same vein, coalition builders will propose formulas that provide generous allocations to their own state. They want to form a successful coalition around a proposal that allocates the largest feasible percentage of funds to their own state. Given this goal, rational, utility-maximizing senators will seek to build winning coalitions at the lowest cost, leaving the maximum amount of funds for their own state. Working from this assumption, Riker (1962) argues that political coalitions will be as small as is necessary to win: The smaller the coalition, the more benefits the winners can share among themselves. All else being equal, larger coalitions in distributive policy are indeed more expensive. But in the Senate, all else is never equal. One consequence of Senate apportionment is that it is simply more expensive to include some states in a distributive coalition than others.

In transportation policy, as in most federal programs, a state's need for funds correlates closely with state population (U.S. General Accounting Office 1995). Senators who seek to meet these greater needs must procure greater amounts of funds in order to obtain the same electoral benefits for themselves that senators representing smaller states receive from procuring smaller amounts of funds. For example, if a senator from Wyoming were able to procure an additional \$20 million in transportation funds in a formula fight, this would be an increase equivalent to nearly \$40 additional per constituent, quite a windfall. In California, the \$20 million increase would only mean an additional 62 cents per constituent. Such considerations make it less expensive for coalition builders to accommodate small-state senators' demands. As a result, smaller coalitions in the Senate are not necessarily less expensive for the coalition builder to construct, and larger coalitions are not necessarily more expensive. The cost of building a coalition depends on the specific states included, not merely on their number.

Rational coalition leaders who attempt to build coalitions at the lowest cost will thus seek out small-state senators' support. If multiple coalition leaders pursue this strategy, then there will be a "bidding war" for small-state senators. As long as these senators' states can be added to the coalition at a lower cost than others, these senators will continue to be more attractive to coalition builders. Rational coalition builders, however, will not compete to obtain the support of the senators who represent states that need more funds, such as California, New York, and Texas.8 Accommodating the demands of these senators would consume too much of the coalition leader's budgetary resources.

The theory of Senate coalition building advanced here deviates from the rational choice approach in one important respect. Formal theorists always assume that those who are not part of the winning coalition will receive nothing (see, e.g., Baron and Ferejohn 1989a;

Riker 1962). The reason is that players are assumed to maximize one goal only, self-interest. Within that framework, legislators are expected to procure as much for their state as possible, without concern for other goals. Members of Congress; however, have multiple goals, and making good public policy is one of them (Fenno 1973; Hall 1996, 68–71; Sinclair 1989, 144–52). Concern for good public policy constrains Senate coalition builders from exploiting losing coalitions to the fullest extent imaginable. A transportation program that allocated no funds to twenty states, for example, would hardly be good public policy. Although the pursuit of reelection will lead senators to prefer formulas that distribute more to their state than less, their interest in good policy will check them from excluding the losers from any share of the funds.

In sum, the theory of coalition building advanced here is fundamentally one of rational choice. Senators are expected to support the proposals that offer their state the greatest share of funds. Coalition leaders will build support for their formula by making the best offer to a winning coalition of senators. In seeking to benefit their own state, coalition leaders will attempt to build winning coalitions "efficiently." Because of differences in state need for funds, the support of some senators can be gained at a lower cost to the program budget than that of others. Rational coalition builders will accordingly seek the votes of these senators. Thus, the following hypotheses will be tested:

Hypothesis 1. Successful coalition builders will seek out less costly members to increase the size of their coalition efficiently.

HYPOTHESIS 2. The final outcome of formula fights will more closely reflect the preferences of small-state senators than large-state senators.

WHY TRANSPORTATION POLICY?

Surface transportation programs provide a good opportunity to study the dynamics of distributive policymaking. One reason is that Congress has jealously guarded its control over the distribution of transportation funds, which is done almost entirely by statutory formulas. Another is that demand for transportation funds is great across all areas of the country, unlike other programs, such as water projects and community development. Every state has roads, highways, and bridges, and thus all senators are concerned with the distribution of transportation dollars. Any differences in senators' success in procuring funds in this area are more likely to reflect differences in Senate influence than in state demand for funds (see Rich 1989).

A third reason is that the politics of transportation is intensely distributive, relatively uncomplicated by controversies over ideology or nondistributive issues. As Senator Trent Lott (R-MS) remarked during the 1991 fight over the transportation funding formula: "It's not a partisan issue. It is even hard to get a fix on how regional an issue it is. It really boils down to how well you do or how poorly you do under the formula" (Cong. Rec. 1991, S7988). Finally, transportation poli-

Because a state's need for federal funds is a function of its population, large-state senators are defined as those from states that are underrepresented in the Senate according to the standard of one person, one vote. Small-state senators are those from states that are overrepresented in the Senate according to this standard.

cymaking provides a unique view into the dynamics of Senate coalition building because coalition leaders always indicate which states they seek to include. The funding formulas for transportation are very complex, with many "adjustments" that greatly affect the amounts states receive.9 This complexity enables senators to construct their coalitions strategically, targeting funds to particular states.10 Both because of the complexity and because senators are so concerned with geographic distribution when considering transportation programs, coalition leaders provide charts that explicitly indicate how much each state will receive under their proposed formula. Using these charts, I am able to reconstruct the composition of transportation formula coalitions better than in other areas for which information about winners and losers under various proposals is not so readily available.

OPERATIONAL DEFINITIONS

A coalition builder is a senator who offers a proposal. This concept is relatively easy to operationalize because bill sponsorship is a matter of public record. The composition of legislative coalitions is considerably more difficult to discern because most proposals introduced in Congress are never brought to a vote, and thus most senators never go on the record as supporters or opponents. Assuming that senators support the formula that is most generous to their state, however, a coalition can be defined as those senators whose state would receive more under one proposal than under any alternative offered.

To determine the composition of coalitions, I simply compare competing proposals. Sometimes coalition builders in formula fights will assume different amounts of money to be distributed with the formula. For comparison, I simply refer to the percentages allocated to each state under the proposals. It is clear from senators' comments that this approach is substantively sound. Percentage shares matter more to senators during formula fights than specific dollar amounts, as the latter are contingent on the final appropriation. During the 1998 transportation formula dispute, for example, senators Arlen Specter (R-PA) and Rick Santorum (R-PA) voted against the bill even though it would have greatly increased the amount of funds for Pennsylvania over the previous level. As Specter explained, "the pending bill would reduce Pennsylvania's share of the total highway formula from the 4.32 percent share under the original ISTEA law (FY 92-97) to 3.79" (Cong. Rec. 1998, S1849).¹¹ To address this concern, senators who propose a formula typically include on their charts each state's percentage share in addition to the dollar amount each would receive given a specific total to be distributed.¹²

To determine the "efficiency" of coalitions, I compare the average amount of funds that coalition builders allocate to the states in their coalition: The more efficient is the coalition, the lower the cost of states in the coalition. Every formula, of course, is designed to allocate all the funds authorized for the program. During formula fights, however, each alternative redistributes only some portion of the funds by comparison to the other formulas proposed or in existence. From the perspective of coalition builders, the most efficient use of these funds is to build the least expensive winning coalition, leaving the most funds to concentrate on their own state.

THE 1991 TRANSPORTATION REAUTHORIZATION

The 1991 Intermodal Surface Transportation and Efficiency Act (ISTEA) marked the last time the interstate highway construction program was reauthorized. Senators recognized that this legislation would define priorities and set precedents for federal highway policy in the postconstruction period. Senator Daniel Patrick Moynihan (D-NY), chair of the subcommittee with jurisdiction over highways, had a vision for the future of surface transportation policy. A critic of previous federal policy, Moynihan sought to emphasize urban planning, environmental protection, and mass transit. Under his leadership, the committee endorsed a proposal to consolidate federal highway categorical programs into a massive block grant, the Surface Transportation Program, which would enable states to spend highway funds on transportation programs of their own choosing, including mass transit.

Despite the sweeping policy changes at issue, the principal subject of contention during the 1991 reauthorization was the geographic distribution of funds. Both the Senate and the Environment and Public Works Committee approved without controversy the major program consolidations and policy changes that Moynihan favored (Mills 1991b, 1575; 1991c, 1367). Deciding how to distribute federal funds, however, occupied both the committee and the Senate throughout the lengthy consideration of this legislation. Floor debate on the bill lasted for ten days, sometimes going

⁹ For a description of federal transportation formulas, see U.S. General Accounting Office 1995. For the most recent transportation formulas adopted, see the conference report accompanying the Transportation Equity Act for the 21st Century (H. Rept. 105–550).

¹⁰ It may be more difficult to construct coalitions artfully in some programs than in others. As Arnold (1979, 217) writes: "In theory it is possible for Congress to write a formula that seemingly allocates benefits according to objective criteria (e.g., per capita income) but that actually allocates them according to political criteria. In practice it is very difficult. Congress would first have to select objective criteria that were good surrogates for all the political criteria, and then would have to devise a complicated weighting scheme." In transportation policy Congress does this. The GAO report (1995, 1) found that "underlying data used in the formulas are to a large extent irrelevant," because allocations are largely determined by "adjustments."

¹¹ Similarly, Senator Carl Levin (D-MI) complained about an amendment that would increase the dollars received by Michigan but reduce its share: "My state gets a smaller percentage under the committee amendment than it does under the underlying bill. You can add all the money you want, which is what the committee did, but the problem is still going to remain in terms of the percentage of the contribution unless something else happens here" (Cong. Rec. 1997, S1298).

¹² See, for example, Cong. Rec. 1991 (S7271), 1997 (S10771, S10767), and 1998 (S1315).

late into the night (Mills 1991d, 1653). How did coalition leaders build support for their proposal? First, a comparison reveals that they constructed coalitions more efficiently by targeting funds to less populous states. Second, because small states' votes could be obtained at a lower cost, the outcome of the formula fight more closely reflected the preferences of small-state senators than large-state senators.

Composition of the 1991 Coalitions

Two coalition builders attempted to determine the distribution of federal transportation funds in 1991, Moynihan and John Warner (R-VA). Moynihan used two strategies. First, he opposed creation of the National Highway System (NHS), a key initiative of the Bush administration to prioritize maintenance of the nation's most heavily used roads and highways. This was a concession to less populous states. Senators from small states strongly opposed the NHS initiative because these states contained a very small proportion of this mileage. Second, Moynihan rejected efforts to change the funding formulas for highway programs, generally maintaining the apportionments states already received under the categorical grants for highways.¹³ Explaining his formula, Moynihan conceded: "We have no rationale for the allocation formula we adopt in this bill, save that it is the existing one. It is the one that is in place" (Cong. Rec. 1991, S7746). This, too, was a concession to less populous states because they had long received back more in federal transportation dollars than they had paid in taxes to the Highway Trust Fund. In keeping these allocations, Moynihan maintained the existing highway coalition; he gained the support of all the members of the committee with the exception of four senators from states larger than average-Bob Graham (D-FL), Warner, Dave Durenberger (R-MN), and Howard M. Metzenbaum (D-OH)—who felt that their state was being shortchanged (Mills 1991c, 1368).

Warner expressed his intention to fight the formula "until we receive that degree of fairness and equity to which we think we are entitled in our respective states" (Cong. Rec. 1991, S7270). When the Senate committee reported the bill on June 6, Warner objected to the motion to proceed and announced his intention to offer an amendment that based the funding formula on the FAST proposal introduced in the House of Representatives (HR 2950). The FAST proposal adopted the administration's NHS policy and proposed a formula to direct funds to states with high levels of highway use. 15

As a consequence, the formula Warner favored would have increased the allocations to populous states and decreased those to less populous states. If Invoking imagery of D-Day on its 47th anniversary, Warner addressed Moynihan: "Our forces have landed... and we have established a beachhead"; he urged him to "come to the peace table as quickly as possible" (Cong. Rec. 1991, S7274).

Figure 1 shows the difference between the Moynihan and Warner proposals in terms of the amount each state would receive. 17 This difference was calculated by subtracting the amount allocated to each state under Moynihan's proposal from that allocated under Warner's proposal. When the point on the graph is above the zero line, the state would be better off under Warner's formula; when it is below the line, the state would be better off under Moynihan's proposal. This difference is plotted for each state in millions of dollars, with the states ranged on the x-axis from least to most populous.

The difference in the composition of the two coalitions is striking. Warner's bill would grant additional funds to nearly all the middle-sized and large states, compared to Moynihan's bill, while cutting funds to every state with fewer than five congressional districts. Of the 28 states with six or more congressional districts, 21 would have benefited from the Warner formula. Moynihan's bill combined benefits to a few populous states—Massachusetts, New Jersey, Pennsylvania, and New York—and to a couple of middle-sized states, Connecticut and Colorado, with benefits to all the least populous states.

With respect to Senate politics, however, the crucial difference between the two formulas illustrated in this figure is that there are more points below the zero line than above it. In other words, more states were better off under Moynihan's formula than under Warner's. Only 22 states would receive more dollars under Warner's formula, and 27 would receive less.¹⁸

Efficiency of Coalitions

Warner's formula would redistribute \$4.9 billion of the total amount to be allocated under the program by comparison to Moynihan's formula. In redistributing these funds, however, the Warner formula was more generous to only 22 states, which was not sufficient to defeat the Moynihan formula. By comparison, Moynihan's bill distributed this \$4.9 billion across more states, ensuring that 27 would receive more than under

¹³ Under the new block grant programs, every state would receive annually an average of the amount it had received over the previous five years for all transportation programs combined.

¹⁴ The Federal Aid Surface Transportation Act (FAST) was introduced in the House of Representatives by Representative Charles E. Bennett of Florida on June 7, 1991 (Cong Rec., E2089). The formula in this bill was uncontroversial in the House.

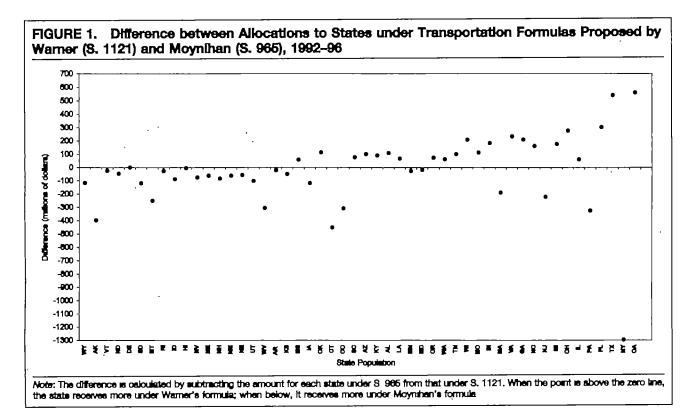

¹⁵ The formula allocated funds as follows: one-third on the basis of a state's proportion of the nation's total diesel fuel use, one-third on the basis of a state's proportion of the national vehicle miles of travel, and one-third on the state's proportion of national highway system lane mileage. The House report emphasized that the new formula's

emphasis on use "reflects the needs of the National Highway System" (U.S. House 1991, 22).

¹⁶ It should be noted, however, that under the formula passed in the House, more populous states would not receive higher per capita allocations than less populous states. The difference between the two formulas is simply in the greater per-capita advantage provided to small states in the Senate bill than in the House bill.

¹⁷ Data are from the Federal Highway Administration and were printed in the Congressional Quarterly Weekly Report (Mills 1991a, 1488).

¹⁸ Delaware receives virtually the same amount under both formulas. Under Warner's bill the state would receive only \$456,000 more than under Moynihan's bill. The difference between the two was not nearly so small for any other state.

the alternative. He was able to do this because the members of his coalition were largely small-state senators and thus on average less expensive to include than the members of Warner's coalition. As a result, the Moynihan coalition was more efficient, enabling the senator to garner a majority while reserving a substantial sum for New York. The mean state in Moynihan's coalition had a population of 2.5 million, considerably smaller than the average state (5 million). By including all the least populous states in his coalition, Moynihan added 23 of the 27 states in his group as beneficiaries at a cost of less than 2% of the program funds each. The mean state in Warner's coalition, by contrast, had a population of 7.6 million, considerably larger than the average state, and cost him 3.1% of the funds.¹⁹

This coalition-building efficiency enabled Moynihan to grant 26% of the \$4.9 billion redistributed funds to his own state. Under Warner's formula, by contrast, no state received a windfall of that magnitude. Virginia only received 6% of the redistributed dollars, an additional \$233 million, under Warner's formula. In short, working with the same overall amount of dollars as Moynihan, the Warner coalition benefiting middlesized and populous states at the expense of the least populous states was a political failure.

Outcome

Warner's formula, which later passed easily in the House, was not politically viable in the Senate. Although he supported Warner's bill, Senator Lloyd

Bentsen (D-TX) recognized during floor debate that it did not have the votes to win: "There is a basic inequity there [in Moynihan's bill] that has to be corrected. I do not know that we have the votes. I understand how one could artfully put together a coalition where there are more winners than losers... But at some point the question of equity has to come in" (Cong. Rec. 1991, 7540). Bentsen recognized that to win on highway formulas, one must have more "winners" than "losers." In the Senate, of course, states and not numbers of constituents are the "players" in the game. This means that, at minimum, a coalition builder must ensure that a majority of states will not lose funds. Warner's formula did not meet even that low threshold.

It is clear from Warner's comments on the Senate floor that he had hoped to construct a successful alternative to the committee bill. When he first objected to consideration of the Moynihan bill, Warner explained that he currently represented a group of nine states and anticipated "it will grow to twice that number and perhaps three times that number" (Cong. Rec. 1991, S7270). He sought to gain time by refusing to "relinquish one inch of ground, procedurally or otherwise" (Cong. Rec. 1991, S7270). During the following ten days, however, Warner failed to gain the support he needed because his formula increased funding for populous states, which precluded coalition-building efficiency and made it impossible to create even a minimal majority coalition.

The Senate vote on the FAST formula took place on June 18, the day before the Senate passed the committee bill. Senators knew that the Warner alternative would not be adopted (see *Cong. Rec.* 1991, S7983, S7993). Although the outcome was not in doubt, the

¹⁹ A t-test of difference of means reveals that difference in the composition of Moynihan's and Warner's formulas is statistically significant (t = 3.7, p < .001)

votes show a strong correlation ($\phi^2 = .85$, p < .001) with states' interests. The FAST formula failed 41 to 57: 98% of the senators whose state would be better off under the Moynihan formula voted against FAST; 93% of those whose state would be better off under FAST voted for it.²⁰

Warner's failure and Moynihan's success support the hypothesis that coalition builders have incentives to benefit less populous states when writing formulas. At a very low cost to the program budget, Moynihan could build a majority coalition and still provide a windfall to his own state, along with generous allocations to a few others. By comparison, Warner made a highly inefficient attempt to build a Senate coalition. Adding the larger states to his coalition simply did not leave enough money to draw in a majority of states. Because of this dynamic, the outcome of the 1991 formula fight more closely reflected the preferences of small-state senators than those of their large-state colleagues. Nearly every small state was a member of Moynihan's winning coalition, and most of the large states were members of Warner's losing coalition. It is important to note that Moynihan's formula prevailed in conference with the House, which left most large-state senators dissatisfied and ready to revisit the funding formula issue at the next reauthorization of the program.21

THE 1998 TRANSPORTATION REAUTHORIZATION

Just as in 1991, the key issue in the 1998 congressional debate over the transportation reauthorization—the Building Efficient Surface Transportation and Equity Act (BESTEA)—was the distribution of funds to states.²² The politics was more complex in 1998, however. Three members of the Senate Environment and Public Works Committee—Warner, chair of the Transportation and Infrastructure Subcommittee; Max Baucus (D-MT), ranking minority member of both the full committee and the subcommittee; and John Chafee (R-RI), chair of the full committee—each introduced

²⁰ The anomalous senators are as follows. Senator Dale Bumpers voted for FAST even though Arkansas would receive more under the committee bill because, he said, the Moynihan formula was "an anachronism" (Cong Rec. 1991, S7983). Even so, he noted that the amendment would not succeed. Washington's senators voted against FAST, as did Senator Alan Cranston (D-CA), even though their states would have received more funds under it. Even if all senators had voted in accord with their state's interests, FAST still would have failed.

²¹ It is not unusual for the House to concede to the Senate on funding formulas in conference committee. Because the recipients of funding formulas are almost always states, constituencies of senators are more directly affected by them than those of House members. As a consequence, senators take a greater interest in funding formulas than do House members (see Lee 1997, 100–5; Lee and Oppenheimer 1999, 192–4). A study of interchamber conflict in 42 formula grant programs reveals that the Senate's formula preferences prevail more than twice as often as those of the House (Lee 1997, 135; Lee and Oppenheimer 1999, 216).

²² The 1991 reauthorization expired at the end of fiscal 1996. As often happens, Congress was unable to reauthorize the legislation before its expiration and had to pass a short-term extension to keep highway funds flowing to the states.

distinct funding formulas and garnered substantial support among other members of the committee and in the chamber as a whole (Hosansky 1997, 1068).

Warner once again backed a formula in the Senate (S. 335) that would have increased allocations to most of the populous states.²³ By comparison, the Baucus formula (S. 532) would have allocated funds more equally across states, granting dramatic share increases to the less populous states in the Rocky Mountains and the Plains.²⁴ With relatively minor changes, Chafee's bill—known simply as the ISTEA Reauthorization Act (S. 586)—would have continued the allocation patterns in the 1991 Moynihan formula.

Compared to the 1991 act, all three formulas proposed share increases for at least 33 states; under every formula at least 33 states would receive a larger percentage of the total allocation than they had received under ISTEA.25 Chafee's formula made the least extensive adjustment to existing legislation-redistributing a relatively small proportion of states' funding shares under ISTEA-whereas Baucus and Warner proposed more far-reaching changes.²⁶ All three increased the shares for a supermajority of states relative to existing law by targeting a handful of populous states for the largest cuts: Warner and Baucus targeted Massachusetts (three percentage share reduction), New York (two percentage share), and Pennsylvania (one percentage share); Chafee focused on Massachusetts (two percentage share), Georgia, Pennsylvania, and Texas (0.5 percentage share each).27 These reductions may appear small, but \$216 billion was eventually authorized. Thus, a one percentage share cut is equivalent to a loss of \$2.16 billion in a state's 1998-2003 funding level compared to what it would have received if the previous share had been maintained. All three coalition builders took the funds gained from targeting a few populous states and distributed them across many others, thus broadly conferring percentage share increases. As a result of these

²³ His formula gave heavy weight to factors measuring the extent of highway use: vehicle miles traveled in the state, diesel fuel consumed in the state, and the state's annual contribution to the federal Highway Trust Fund.

²⁴ The formula placed less weight on highway use factors, greater weight on highway mileage, and included factors to measure population density (conferring bonuses on states with low densities) and freeze-thaw rates.

²⁵ All these formulas made use of adjustment factors to ensure that the distributive patterns reflected coalition builders' intentions. Coalition builders are not constrained by the outcomes produced by the formula factors they select; these merely provide a baseline before adjustments are factored in. As Chafee explained: "When you run something like that [the formula], you frequently end up with difficulties. Not everything comes out just the way you want it. So we made adjustments to the best of our ability" (Cong. Rec. 1998, S5392).

²⁶ Compared to the allocations under ISTEA, Chafee's formula redistributed 5% of the shares, whereas Warner and Baucus each redistributed approximately 8% of the shares.

²⁷ Share cuts are calculated by subtracting the percentage of the total funds that the state received under ISTEA from the percentage of the total funds the state would receive under each formula. Under ISTEA, for example, New York received 6% of the total transportation funds and would only receive 4% of the total under the Baucus formula, for a cut of two percentage shares.

strategic choices, it appears that any of the formulas-if presented alone on the Senate floor-could have garnered a filibuster-proof majority to defeat the status quo.

Efficiency of Coalitions

Yet, no Senate majority preferred any one of these formulas to the other two. The Senate divided roughly into thirds: 26 senators (13 states) preferred the Warner formula; 44 senators (22 states) preferred the Baucus formula; and 30 senators (15 states) preferred the Chafee formula. Under Senate rules, regardless of which formula the committee reported, other coalition builders could offer their alternative.

Just as in 1991, gaining the votes of senators from populous states required a larger proportion of funds than gaining the votes of senators from less populous states. Efficiently constructed coalitions thus contained fewer large states and more small states. Table 1 presents data on the composition and efficiency of these three coalitions: their size, the percentage of the total funds offered to coalition members, the funding increases offered over existing law, and the increases that coalition builders proposed for their own constit-

Table 1 indicates that the Warner coalition was the least efficient, that is, the average state in the coalition consumed a larger share of the program funds than the average state in either of the other two coalitions. The Warner group consisted of medium-sized and large states from the Midwest and South, and the average state had a population of 7.5 million and cost 3.1% of the funds. Relative to existing law, Warner proposed substantial funding increases for his coalition—a 15% increase in the average coalition state's share—and a 16% increase for Virginia. Given the high cost of the coalition's members, it is no surprise that the Warner group was also the smallest. Only 13 states preferred his formula to the others.

Like Moynihan's strategy for ISTEA, Chafee offered more funding for a few populous states—New Jersey, New York, and California—and for many small states. The average state in the Chafee coalition had a population of 5.3 million and cost 2.2% of the total funds. Accordingly, it was both more efficient and larger (15 states) than Warner's. There would be modest funding share hikes for the states in his coalition—5% on average—and an 8% increase for Rhode Island. These relatively lower funding increases are the result of the less dramatic shifts that Chafee proposed in existing funding levels.

The Baucus coalition was both the largest and the most efficient. It consisted of about half the small states, several smaller-than-average southern states, and no state more populous than Illinois; the average member had a population of only 3.2 million and only cost 1.6% of the program funds. Although Baucus and Warner redistributed the same percentage of the funds—about 8% of ISTEA—Baucus constructed his coalition far more efficiently than Warner. Even though Baucus proposed the largest funding increase for his own constituents of any coalition builder—a 25% increase over the status quo—the coalition's efficiency enabled him to build the largest group (22 states) and even offer members the largest funding increases of any coalition builder, an average of 26%.

Analysis of variance was conducted to determine whether the differences among the three coalitions are statistically significant. For the differences in the mean percentage of the funds allocated to the average state in the coalitions²⁸ and the mean percentage increases offered coalition states,29 the F-statistics are statistically significant. For the differences in the population of the average state in the coalition, the F-statistic is 2.7 (p <.10).

Outcome

Because no formula could command a majority, the three coalition leaders bargained in committee for seven months in an attempt to formulate a proposal that would prevail on the Senate floor. The same logic of coalition building continued to apply at this stage. Because of their lower funding demands, small-state senators remained more attractive as coalition members than other senators; they emerged as power brokers on the committee and strongly influenced the bill eventually reported. Baucus and three other smallstate senators, Dirk Kempthorne (R-ID), Harry Reid (D-NV), and Craig Thomas (R-WY), were "kingmakers in the committee, able to tilt the balance of power one way or the other" (Hosansky 1997, 1068).

The F-statistic is 3.1 (p < .05).

²⁹ The F-statistic is 8.2 (p < .01).

Kempthorne observed: "We've had lots of interest by different players...we're in a pretty good spot" (Hosansky 1997, 1068). Early in the bargaining process, Warner sought an alliance with Baucus. "I think there's a lot of mutuality," Warner said, "if we could get a merger, we have a very strong block of states" (Hosansky 1997, 1068).

Warner and Baucus did, in fact, ally around a new proposal (Weisman 1997b). This required a substantial sacrifice from Warner, who had to abandon his plan to ensure that every state would receive back at least 95% of its contributions to the Highway Trust Fund, a longstanding goal of large-state senators that Warner had supported for years. Explaining this on the floor, Warner said: "It had been our hope to reach 95 cents [on the dollar] but we soon recognized that we could not do it if we were to build a successful coalition and to properly recognize the individual requirements of certain geographic regions of the United States, primarily the western states" (Cong. Rec. 1997, S9254). The best that Warner could assure his large-state colleagues was a 90% return on their highway taxes.

After the Warner and Baucus coalitions converged, committee chair Chafee eventually gave them his support. Warner discussed the history of the alliance on the Senate floor: "As subcommittee chairman, I started out with a group called Step 21 [his initial formula] and then eventually we joined forces with a group headed by Senator Baucus—Stars 2000 is my recollection—and eventually our distinguished chairman joined us" (Cong. Rec. 1997, S10770). In joining the coalition, Chafee obtained a modest funding share increase for Rhode Island and for most of the other small states in his coalition. Chafee's large-state members were the principal losers under the formula eventually reported. Eighty percent of the funding share cuts imposed in the committee bill were taken from large-state members of Chafee's coalition.³⁰ The committee reported its bill to the Senate floor on October 1, 1997, by a vote of 18-0.

The Small-State Advantage in 1997–98 Formula Politics

Under the committee's formula (S. 1173), 35 states received funding share increases compared to the 1991 formula (ISTEA), and 15 states suffered cuts. Within both these groups, however, some states did better than others. A multivariate regression model was employed to determine the effect of state size on the outcome (n = 50). The dependent variable is States' Percentage Increase or Decrease in the Senate's 1998 Surface Transportation Bill (S1173) Relative to 1991 Levels.

The independent variable is *Reciprocal of State Population* (1/state population in millions). The transformation of state population is needed to reflect the

²⁰ The funding share reductions were taken from Massachusetts (40%), Pennsylvania (17%), New Jersey (7%), New York (6%), and Connecticut and Maryland (4% each)—all members of the Chafee coalition and underrepresented in the Senate compared to the standard of one person, one vote.

nonlinear relationship between state population and the dependent variable (see also Lee 1998, 47). Because the populous states receive such large sums in absolute terms, relatively small cuts in their share can finance large increases for the smallest states. A cut of 1% in California's 1991 transportation share (compared to ISTEA) is equivalent to \$199 million, a sum that could, for example, fund an 86% increase in Wyoming's share. Because of the very different sums involved when senators adjust the shares of large and small states, the effect of state population on Senate outcomes is expected to follow the Phillips curve.³¹ Under this functional form, the effect of state population on Senate outcomes is greatest for the smallest states, but the slope of the line flattens out at the higher values of state population. In other words, the model predicts that the smallest states will experience dramatic funding percentage increases, medium-sized states small percentage increases, and large states very small increases or cuts.

Control variables are included to account for states' other political advantages in the process and for changes in their need for federal transportation dollars between the early and late 1990s. To address the possibility that party and committee representation affect outcomes, three variables are included. First, States' Partisan Representation controls for the effect majority party status has on distributive politics. The Democrats held a majority in the Senate during the 1991 transportation reauthorization; the Republicans were in the majority in 1997 and 1998. Did the change in party control benefit states represented by Republicans? The variable is coded 0 for states with no Republican senator, 1 for states with one Republican senator, and 2 for states with two Republican senators. Second, a dummy variable, State Represented by Ranking Member on Committee, accounts for the advantages of committee leaders, coded 1 if a state is represented by a senator who is a chair or a ranking member on either the committee or subcommittee, 0 otherwise. Third, a dummy variable, State Represented on Committee, accounts for any advantages that states gain from committee representation, coded 1 for all states represented by senators who are members of the Environment and Public Works Committee, 0 otherwise.

To address the effect of changes in state need for federal transportation funds, two control variables are included: Percentage Change in States' Federal-Aid Highway Mileage and Percentage Change in the Vehicle Miles Traveled in the State.³² Clearly, one would expect states that have experienced increases in the use or extent of their highway system to receive additional dollars.

Finally, to account for the incidence of majority rule cycling between 1991 and 1997, the model includes a

³¹ For a discussion and illustration of this functional form, see Brown 1991, 130.

²² Data are from the Office of Highway Information Management, Federal Highway Administration, for 1990 and 1995 (the last year for which data are available).

TABLE 2. States' Percentage Funding Increase or Decrease In the Senate's 1998 Surface Transportation Bill (S. 1173) Relative to 1991 Levels, Regressed on State Population and Control Variables

variable identifying the states that were winners in the 1991 transportation battle, *Per-Capita Percentage Share under ISTEA*. In attempting to retain the ISTEA apportionments, for example, Chafee had to contend with many senators' perceptions that "the Northeast made out like bandits last time" (Ota 1998a, 656). Given this kind of concern, states that were winners in the formula battle of 1991 were likely to receive smaller increases or even cuts in 1997; thus, the sign on this variable is expected to be negative.

The results of the regression are shown in Table $2^{.33}$ The findings provide strong support for the hypothesis that small-state senators are advantaged in the coalition-building politics of funding formulas. The model reveals a strong relationship between state population and the state's funding increase or cut in the Senate bill. The coefficient on the reciprocal of state population is $3.68 \ (p < .01)$, which reveals that less populous states received substantially larger increases in transportation funding than did more populous states.

The control variables also seem to affect funding patterns in the Senate bill. Change in Senate party control had a statistically significant effect: States represented by Republicans tended to receive larger increases in transportation funding than states represented by Democrats. States with increased levels of highway use (measured by percentage change in the

vehicles miles traveled in the state) received additional funds (B=.17, p<.05). In addition, states that fared well under the 1991 transportation formula tended to receive smaller funding increases or, in some cases, cuts in share (p<.05). Although the signs on the other control variables are in the expected direction, their coefficients do not reach statistical significance.³⁴

Holding the control variables at their means, the model predicts that a state the size of Wyoming would receive an increase of 36% in the Senate's 1997 bill relative to its 1991 funding level, while a state the size of California would receive a funding share cut of 3.6%. Given the total amount appropriated for transportation in 1998, such a cut is equivalent to a loss of more than \$717 million. In sum, the data clearly reveal that the final 1997 Senate committee bill reflected the preferences of small-state senators more closely than those of other senators.

After trouble on the floor in 1997 and two weeks of debate in 1998 that focused on the distribution of funds to the states (Ota 1998b, 1998c; Weisman 1997a), the committee's formula was approved by the Senate on March 12, 1998, with a 96-4 vote. Before passage, some large-state senators-including Levin of Michigan and Specter of Pennsylvania-complained about the distribution of funds (Cong. Rec. 1998, S1848–50). No doubt, the large funding increases authorized which were 40% over the 1991-96 level, helped mollify the losers. Every state except Massachusetts received dollar increases over previous levels, even though 15 states had their funding shares reduced. It is clear that Warner was more pleased with the outcome in 1998 than in 1991. He had succeeded in raising the funding share for all the middle-sized southern states, particularly Virginia. In addition, he obtained small share hikes for the populous southern states, Florida and Texas. Warner could only secure these gains by increasing small states' shares above the 1991 formula level and by substantially cutting the shares for several populous states.

Warner's success suggests that he had learned some things since his defeat in 1991 about how to build successful Senate coalitions in funding formula politics. His 1997 strategy eventually mirrored that of Moynihan in 1991: Procure funding increases for one's own state by constructing an efficient Senate coalition. Doing so means securing small-state senators' votes using the funds gained by excluding some populous states from the coalition. By accepting smaller increases than he wanted for his own coalition members and by focusing share cuts on a few populous states, Warner was able to merge his group with Baucus's, thus building the supermajority coalition necessary to succeed in the Senate. As in 1991, the Senate's formula largely prevailed in conference with the House.³⁵

25 The only significant change between the Senate bill and the

³³ OLS regression statistics were calculated using SPSS 8.0 for Windows.

³⁴ In order to determine whether majority party members of the Environment and Public Works Committee received additional advantages, an interaction term (state's representation on committee × state's partisan representation) was added to the model. The coefficient was not statistically significant, and the variable did not add any explanatory power to the equation.

CONCLUSION

It goes back to the very fundamental principle, Mr. President, the very fundamental principle that when our forefathers laid down this Government and fashioned this Republic, the oldest surviving democratic form of republic on earth today, the United States with its Constitution and Bill of Rights, when they fashioned that, they recognized letting the states have equal representation in the Senate...so we strengthened the financial position of the western states.

—Senator John Warner (R-VA), Congressional Record, September 12, 1997, S9255

Equal representation of states in the Senate, "the very fundamental principle" Warner invokes, affects Senate politics in a crucial but long-ignored way. Senate apportionment creates a situation in which it is much less expensive to obtain some votes than others. In the context of funding formula controversies, it is clear that senators prefer the formula that will distribute the most funds to their state. Similarly, senators who build coalitions in support of formulas do so (at least in part) in order to increase funding to their own state. Because state need for federal funds corresponds closely with state population size, it is relatively inexpensive to provide funding increases for small states. As a result, coalition leaders who seek support for formulas that benefit their own state can both build winning coalitions and offer larger increases to their own states by including small-state senators and excluding their large-state counterparts. In sum, coalition leaders in the Senate have strong incentives to "strengthen the financial position" of less populous states.

The surface transportation battles of the 1990s clearly reveal these coalition-building dynamics. In both 1991 and 1997, the coalitions containing more small-state senators were less expensive to build, with the cost of the average vote being substantially lower in these coalitions than in those containing more largestate senators. Coalition-building efficiency gives senators two advantages. First, it enables them to provide more funds for their own constituents. In 1991 Moynihan both built a winning coalition and obtained a generous allocation for New York by devising a formula that all the small-state senators and a few largestate senators preferred to the alternative proposed. In 1997 Warner compromised his longstanding goal of increasing funding levels for all the large states and instead excluded a number of them from his coalition. using those funds to gain the support of small-state senators. In this way, he raised the funding share for his own state. Second, building coalitions efficiently enhances the chance of success. Efficiency means that more funds are available to spread across other states and thus garner additional votes. In 1991, the more efficient coalition won outright. In 1997, Warner merged with the highly efficient Baucus coalition to

conference report was a one percentage share increase for Pennsylvania, doubtless the result of the influence of conference committee chair and House Transportation and Infrastructure Committee chair Bud Shuster (R-PA). The increase was produced by tiny percentage share cuts spread across 35 states.

support a formula that could garner the supermajority needed to prevail.

Because they are so attractive to coalition builders, small-state senators have an advantage in funding formula disputes. They possess the votes needed to build efficient coalitions. For this reason, coalition leaders accommodate their demands to a greater extent than those of others. The bills passed by the Senate after both the 1991 and 1997 transportation formula fights more closely reflect the preferences of small-state senators than their large-state colleagues. In 1991, the formula preferred by small-state senators won outright. In 1998, the final bill gave larger funding increases to small states than to others.

These coalition-building dynamics have considerable consequences for understanding distributive policy in the United States. The overwhelming majority of all federal domestic assistance funds—in fiscal 1995. 90%—is allocated by congressionally mandated formulas (Advisory Commission 1995, 14). Despite this, political scientists have taken relatively little interest in funding formulas, focusing instead on the distribution of project grants and earmarked funds in appropriations legislation. Such a preference almost certainly derives from the dominant theoretical approach in the field, the study of how powerful members of Congress direct funds to their district and state. From this perspective, formula grants lack interest because they are stable for long periods and thus do not closely reflect the distribution of committee and party power in a particular Congress. The longevity of funding formulas, however, makes the small state's advantage in formula politics all the more significant. The distribution of committee and party power changes over time, but small states are always advantaged in the Senate. Regardless of when programs are created or reauthorized, small-state senators are always well positioned to benefit from their attractiveness to coalition builders.

The findings from this study have important implications for the theoretical and empirical study of congressional politics. Theoretical work on coalition building typically conceptualizes divide-the-dollars games as symmetric, meaning that the value of a coalition is contingent solely on its size. In the Senate, however, the game is not symmetric: Smaller coalitions are not necessarily able to provide higher payoffs than larger ones. Instead, coalitions are constructed efficiently when they include certain players rather than others. Coalition builders can obtain small-state senators' votes at a lower price than large-state senators' votes. As a consequence, coalitions containing smallstate senators provide greater payoffs to members and leaders than do coalitions containing large-state senators. This study points to the need for models of coalition building that take Senate apportionment into account.

Empirical work on distributive politics tends to neglect coalition building in favor of studying legislative outcomes. Indeed, nearly all the scholarship on coalition building in Congress has been in formal theory. Empirically oriented researchers need to pay more attention to the strategies, alternatives, and incentives of legislators as they construct coalitions. The study of coalition-building processes will, of course, enhance understanding of legislative outcomes. The findings presented here help explain the pervasive small-state advantage in the distribution of federal funds that has been documented elsewhere (Atlas et al. 1995; Lee 1998; Lee and Oppenheimer 1999). Going beyond outcomes will also make possible a fuller, more complete knowledge of how the structures of American political institutions—including Senate apportionment—shape policymaking.

A Bargaining Model of Collective Choice

JEFFREY S. BANKS California Institute of Technology JOHN DUGGAN University of Rochester

e provide a general theory of collective decision making, one that relates social choices to the strategic incentives of individuals, by generalizing the Baron-Ferejohn (1989) model of bargaining to the multidimensional spatial model. We prove existence of stationary equilibria, upper hemicontinuity of equilibrium outcomes in structural and preference parameters, and equivalence of equilibrium outcomes and the core in certain environments, including the one-dimensional case. The model generates equilibrium predictions even when the core is empty, and it yields a "continuous" generalization of the core in some familiar environments in which the core is nonempty. As the description of institutional detail in the model is sparse, it applies to collective choice in relatively unstructured settings and provides a benchmark for the general analysis of legislative and parliamentary politics.

central finding in the spatial model of collective choice, known at least since the work of Plott (1967), is that in two or more dimensions the majority rule core, consisting of those alternatives unbeaten in pairwise majority comparisons, is empty for most configurations of individual preferences (Cox 1984; Davis, DeGroot, and Hinich 1972; Le Breton 1987; McKelvey and Schofield 1987; Plott 1967; Rubinstein 1979; Schofield 1983). In addition, McKelvey (1976, 1979) has shown that the majority preference relation is particularly badly behaved when the core is empty: Any one alternative can be reached from any other through a series of pairwise majority comparisons, which makes it difficult to place any bounds on the possible outcomes of collective decision making (see Cohen 1979; Cohen and Matthews 1980; and Schofield 1978 for related "chaos" results). Furthermore, these results are not peculiar to majority rule but extend to all voting rules (short of ones such as dictatorship and unanimity) in one form or another (Austen-Smith and Banks 1999; Banks 1995; Greenberg 1979; Saari 1997; Schofield 1984; Strnad 1985). Therefore, the simple application of majority (or some other) rule is often insufficient to generate useful predictions and, as a consequence, is lacking as the basis for a general theory of collective decision making.

These negative results concerning the core had a profound effect on subsequent research in political science. Indeed, Weingast (1989, 975) states that "the literature on the positive theory of legislatures remains under the spell of McKelvey and his colleagues." One of the more popular escape routes, beginning with the work of Kramer (1972) and Shepsle (1979), has been to identify legislative procedures and arrangements as

elements of more explicit decision-making processes, ones that work to constrain the chaotic tendencies of the majority preference relation. These "structure-induced" equilibrium approaches typically generate predictions when no "preference-induced" (i.e., core) outcomes are to be found, and they highlight the relevance of incorporating real-world features into models of political phenomena. Our goal, in contrast, is a model that incorporates less institutional detail. Such a model would serve as a benchmark for the general analysis of legislative and parliamentary politics but could be applied to describe collective decision making even in relatively unstructured settings.

With this in mind, we assume that the decision-

making process takes the form of bargaining. Specifically, we embed the noncooperative bargaining model of Binmore (1987) and Baron and Ferejohn (1989) in the general spatial model of politics in which two or more individuals must select an alternative from a compact, convex subset of multidimensional Euclidean space. Individuals' preferences are represented by continuous and concave utility functions but are otherwise quite arbitrary; thus, besides the classic spatial model of politics, we admit "divide-the-dollar" problems, exchange economies, and public goods economies (with or without private goods). In common with most of the bargaining literature, the decision process is one of discrete time and infinite horizon, and in each period a single proposal is made and is either accepted, stopping the process, or rejected, moving the process to the next period. Individuals may or may not discount future utility, and discount rates are allowed to vary among the individuals. In contrast to the models of Rubinstein (1982) and others, the identity of the proposer does not alternate in a fixed sequence; rather, the proposer is randomly selected, or "recognized," in each period. The recognition probabilities are time-invariant but otherwise unconstrained. Finally, passage of a proposal requires the assent of one from a collection of "decisive coalitions," which is time-invariant and is arbitrary save for the minimal conditions of nonemptiness and monotonicity.

We prove the existence of stationary "no delay" equilibria, in which proposals and voting decisions are independent of the time period and history of the game

Jeffrey S. Banks is Professor of Political Science, Division of Humanities and Social Sciences, California Institute of Technology, Pasadena, CA 91125. John Duggan is Assistant Professor of Political Science and Economics, University of Rochester, Rochester, NY 14677.

The authors thank the Editor and three anonymous referees for helpful comments, as well as seminar participants at Caltech, Columbia, Cornell, Duke, ITAM, NYU, Rochester, Stanford, Toronto, Washington University, the 1998 Social Choice and Welfare meetings, the 1998 Wallis Political Economy Conference, the Second Workshop on Coalition Formation in Bilbao, and the 1999 Latin American Econometric Society meetings.

and in which the first proposal is always accepted. Furthermore, we show that when discount rates are all less than one, delay cannot occur in any stationary equilibrium. We show that the set of equilibrium outcomes varies upper hemicontinuously in the recognition probabilities and the individuals' discount factors, as well as in various utility-specific parameters (e.g., ideal points in the case of quadratic utilities). Thus, "small" variations in the parameters of the model cannot cause the set of equilibrium outcomes to "blow up." We also provide a two-dimensional, three-person, majority-rule example with impatient individuals in which multiple equilibrium payoffs arise, thereby precluding any universal uniqueness result.

Our existence result requires that individuals be allowed to mix over their proposals, but for a restricted class of environments we prove the existence of pure strategy stationary equilibria. Interestingly, the sufficient conditions for pure strategy existence turn out to be well-known conditions sufficient for nonemptiness of the core of the voting rule, as described by the set of decisive coalitions: We can assume either that the policy space is one dimensional or that there is a privileged group (an "oligarchy") with the power to pass a proposal, each member of which possesses a veto. As a special case of the latter assumption, we obtain pure strategy equilibria under unanimity rule.

We next turn to the relationship between the equilibrium outcomes in the bargaining game and the core outcomes (if any) of the underlying voting rule. We show that, when the individuals are perfectly patient and utility functions are strictly quasiconcave, equivalence of stationary equilibrium outcomes and core outcomes obtains if the policy space is one dimensional (in which case, under majority rule, the core consists of the median policy or policies) or if some individual possesses a veto, the latter condition weaker than the existence of an oligarchy but also known to be sufficient for nonemptiness of the core. In the one-dimensional case, therefore, our bargaining model provides a version of the Median Voter Theorem, as in Black's (1958) model of committee decision making and in Downs's (1957) model of competition between political parties. We also show that if individuals' utilities are quadratic, if the voting rule is "strong" (e.g., majority rule with an odd number of individuals), and if a core point exists, then core equivalence once again obtains. Using our upper hemicontinuity result, we find that if preferences are "close" to being quadratic and admitting a nonempty core, and if individuals are sufficiently patient, then the outcomes of the bargaining process will be "close" to core outcomes; and if there is a unique core outcome, then all equilibrium outcomes will be close to one another as well. Thus, we can view the model as providing a "continuous" generalization of the core: When the core is nonempty, the equilibrium outcomes of the process coincide with the core, while the small changes in preferences that may cause the core to become empty have only small consequences on the equilibrium outcomes.

In related work, Binmore (1987) analyzes a model of bargaining among two individuals, in which the alter-

natives are divisions of a "dollar," individuals have selfish preferences, and unanimous agreement is required to pass a proposal. Baron and Ferejohn (1989) analyze that model allowing for multiple individuals and assuming majority rule is used. Whereas the latter authors assume utility equal to the amount of the dollar received, Harrington (1989, 1990a, 1990b) extends the model to allow for risk aversion; Calvert and Dietz (1996) allow for externalities in consumption of the dollar. Baron (1991) examines the case of a twodimensional set of alternatives, three voters with quadratic preferences, and voting by majority rule. Winter (1996) analyzes the advantage of veto players over others in the divide-the-dollar problem, assuming at least one individual has a veto; McCarty (1998) takes up the same subject, allowing for variable veto power across individuals. Jackson and Moselle (1998) consider the case in which a one-dimensional public decision is selected along with a division of a dollar using majority rule; they investigate the nature of coalitions "formed" in equilibrium. Merlo and Wilson (1995) study the divide-the-dollar problem under unanimity rule and allow the size of the dollar to change stochastically over time, which generates (efficient) equilibrium delay as a consequence. Notably, they prove uniqueness of stationary equilibrium payoffs in their model.

Other work on bargaining and the core stems from Selten's (1981) model, in which a proposal to a coalition consists of a vector of payoffs "feasible" for the coalition. Chatterjee, Dutta, Ray, and Sengupta (1993) analyze a transferable utility game with discounting and a fixed "protocol" describing the order of proposers and respondents, with the first rejector becoming the new proposer. They show how delay is generally possible even in stationary equilibria, and they provide conditions under which delay cannot occur. Moldovanu and Winter (1995) examine a nontransferable utility game with no discounting and with a similar "rejector becomes proposer" feature, and they prove an equivalence between the core and stationary "order independent" equilibrium outcomes. Okada (1996) studies a transferable utility game with equal discount rates and a random recognition rule with equal recognition probabilities. He shows that delay does not occur in equilibrium and provides conditions sufficient for the existence of efficient equilibria as the common discount rate goes to one.

THE MODEL

Let $X \subseteq \mathbb{R}^d$ denote a nonempty, compact, convex set of alternatives, with $d \geq 1$, and let $N = \{1, \ldots, n\}$ denote the set of individuals, with $n \geq 2$. Individuals interact to select a single alternative from X, with the timing of interaction as follows: (1) At $t \in \{1, 2, \ldots\}$, individual $i \in N$ is recognized with probability ρ_i , where $\rho = (\rho_1, \ldots, \rho_n) \in \Delta$, the unit simplex in \Re^n ; (2) if recognized, i makes a proposal $p_i^t \in X$; (3) all $j \in N$ simultaneously vote either to accept or to reject the proposal. The recognition probabilities, ρ_1, \ldots, ρ_n , are exogenously fixed throughout the game. Let $\mathfrak{D} \subseteq \mathbb{R}$

 $2^{N}\setminus\{\emptyset\}$ denote a collection of coalitions, called *decisive*, also exogenously fixed throughout the game. If $\{j \in N | j \text{ accepts}\} \in \mathfrak{D}$, then the proposal p_i^t is the chosen alternative, and the game ends; otherwise, the process moves to period t+1 and is repeated.

In general, we impose on the voting rule \mathfrak{B} only the minimal conditions that it is nonempty and *monotonic*: $C \in \mathfrak{D}$ and $C \subseteq C'$ imply $C' \in \mathfrak{D}$. (Together, these two assumptions imply $N \in \mathfrak{D}$.) Thus, we allow for a variety of voting rules beyond such common examples as majority rule $(\mathfrak{D} = \{C \subseteq N | | C| > n/2\})$, unanimity rule $(\mathfrak{D} = \{N\})$, and dictatorship $(\mathfrak{D} = \{C \subseteq N | i \in C\})$ for some $i \in N$. For instance, it could be that the set of individuals is partitioned into two "houses," N_1 and N_2 , and that majorities from each house are required to pass a proposal:

$$\mathfrak{D} = \left\{ C \subseteq N \middle| \left| C \cap N_1 \right| > \frac{n_1}{2} \text{ and } \left| C \cap N_2 \right| > \frac{n_2}{2} \right\},\,$$

where $n_1 = |N_1|$ and $n_2 = |N_2|$. Adding an "executive" with a veto is straightforward. We also allow for more unusual voting rules, such as when \mathfrak{D} contains all nonempty coalitions; in this instance, a proposal passes if at least one individual votes to accept.

Some of our results, however, do place additional qualitative restrictions on the voting rule. Say that \mathfrak{D} is (1) proper if $C \in \mathfrak{D}$ implies $N \setminus C \notin \mathfrak{D}$; (2) collegial if $\bigcap_{C \in \mathfrak{D}} C \neq \emptyset$; (3) oligarchic if $\bigcap_{C \in \mathfrak{D}} C \in \mathfrak{D}$; and (4) strong if $C \notin \mathfrak{D}$ implies $N \setminus C \in \mathfrak{D}$. Thus, properness precludes the possibility of disjoint decisive coalitions, while collegial rules are those that give at least one individual (belonging to each decisive coalition) a veto; and a collegial rule is oligarchic if the vetoers are decisive by themselves. Prime examples of oligarchical voting rules are dictatorship and unanimity. An easy example of a strong rule is majority rule when n is odd. We next give a "one-parameter" illustration of all these concepts.

Example 1. Let n = 5, and consider a weighted q-rule with the following weights assigned to the individuals: $w_1 = w_2 = .35$, $w_3 = w_4 = w_5 = .1$. The set of decisive coalitions is then $\mathfrak{B} = \{C \subseteq N | \Sigma_{i \in C} w_i \ge q\}$, where q is fixed in (0, 1]. For $q \in (.45, 1]$, the rule is proper, since a decisive coalition must contain at least one "large" individual and either the other large one or two "small" ones, in which cases the complement cannot be decisive. For $q \in (.65, 1]$ the rule is collegial, as the membership of the two large individuals is necessary for a coalition to be decisive. For $q \in$ (.65, .70] the rule is in fact oligarchic, since a decisive coalition requires both large individuals to be members, and these individuals together constitute a decisive coalition. Similarly, for $q \in (.90, 1]$ the rule is oligarchic, since the only decisive coalition is N. Alternatively, for $q \in (.7, .9]$ the rule is collegial but not oligarchic, because the only individuals needed for a decisive coalition are the large ones, but they do not

make up a decisive coalition by themselves. Finally, the rule is strong when $q \in (0, .55]$, since a coalition or its complement must include either both large individuals or one large and two small individuals; whichever one does is a decisive coalition.

Each individual i's preferences over outcomes are described by a von Neumann-Morgenstern utility representation $u_i: X \to \Re$ and a discount rate $\delta_i \in [0, 1]$ as follows: If $x \in X$ is accepted in period $t \in \{1,$ 2, ...}, then i's payoff is $\delta_i^{t-1}u_i(x)$; if no alternative is ever accepted, then each individual receives a utility of zero. We assume throughout that each u_i is continuous and concave and that $u_i(x) \geq 0$ for all $x \in X$; moreover, we assume there is some $x \in X$ such that, for all $i \in N$, $u_i(x) > 0.2$ For some of our results, we also assume that each utility representation u, is strictly quasiconcave in this sense: For all $x, y \in X$ with $x \neq y$ and for all $\alpha \in (0, 1)$, $u_t(\alpha x + (1 - \alpha)y) > \min\{u_t(x),$ $u_i(y)$. Geometrically, this means that the set of alternatives weakly preferred to any x by individual i is "strictly" convex. For other results, we use a weaker condition, defined as follows. Denote i's weak and strict upper contour sets at x, respectively, by

$$R_{i}(x) = \{ y \in X | u_{i}(y) \ge u_{i}(x) \},$$

$$P_{i}(x) = \{ y \in X | u_{i}(y) > u_{i}(x) \},$$

and let

$$R_C(x) = \bigcap_{r \in C} R_r(x),$$

 $R(x) = \bigcup_{C \in S} R_C(x),$

with similar conventions used for $P_C(x)$ and P(x). That is, $R_C(x)$ consists of the alternatives that every member of C weakly prefers to x, and R(x) consists of the alternatives weakly preferred to x by all members of some decisive coalition, with similar interpretations of $P_C(x)$ and P(x). Given $Y \subseteq X$, let \overline{Y} denote the closure of Y. We say that the condition of *limited shared weak preference* (LSWP) holds if, for all $C \subseteq N$ and all $x \in X$,

$$|R_C(x)| > 1$$
 implies $R_C(x) \subseteq \overline{P_C(x)}$.

That is, if y (distinct from x) is weakly preferred to x by all members of a coalition C, then it can be approximated by alternatives that all members of C strictly prefer to x. Many familiar environments, including those below, satisfy LSWP.

• Classical spatial model/Pure public goods. Each u_i is strictly quasiconcave, as when there exists x^i such that $u_i(x) = k_i - ||x - x^i||$ or $u_i(x) = k_i - ||x - x^i||^2$. Or, if alternatives represent public goods, each u_i may be monotonic as well.

¹ In the terminology of cooperative game theory, ² describes a simple game, and the elements of ² are "winning coalitions."

 $^{^2}$ We implicitly assume here that the status quo (the outcome prevailing in the absence of agreement) has a utility of zero; by our normalization of utilities, it follows that the alternatives in X are unanimously weakly preferred to the status quo. In our concluding discussion, we explain that this restriction can be relaxed if the discount rates of the individuals are identical.

- Public decisions with transfers. $X = Z \times T$, $T \subseteq \Re^n$, and each u_i is quasilinear: $u_i(z, t) = \phi_i(z) + t_i$, ϕ_i strictly quasiconcave.
- Exchange economy. Alternatives are allocations of private goods, and each u_i is strictly quasiconcave and strictly monotonic in i's consumption.
- Divide the dollar. $X = \Delta$, and $u_i(x) = x_i$.

To see why LSWP holds in the classical spatial model, for example, suppose all members of coalition C weakly prefer some alternative y to $x \neq y$. By strict quasiconcavity, every convex combination of x and y (with positive weight on both) is strictly preferred to x by all members of C. Letting the weight on x go to one, we approximate x by alternatives in $P_C(x)$, as required. Banks and Duggan (1999) prove that LSWP holds in two general models, from which all the above examples can be obtained as special cases.

Complete information about preferences, the structure of the game form, and so on, is assumed throughout. A history of length l in the game describes all that has transpired in the first l periods (who the previous proposers were, what they proposed, how individuals voted) as well as whether in the current period we stand prior to the proposer being recognized, after such recognition but prior to the proposal being made, or after the proposal but prior to the vote. Therefore, in general a strategy for an individual would be a mapping that specifies an intended action (what to propose, how to vote) as a function of all histories of all lengths. Since our focus is only on equilibria in stationary strategies, we shed unneeded generality and provide a formal definition only of such strategies. A (pure) stationary strategy for $i \in N$ consists of a proposal $p_i \in X$ offered any time i is recognized and a measurable decision rule $r_i: X \to \{\text{accept, reject}\}\$, or equivalently an acceptance set $A_i = r_i^{-1}$ (accept).

It turns out that mixtures over proposals are required for our most general existence result, so let $\mathfrak{P}(X)$ denote the set of Borel probability measures on X, and endow $\mathfrak{P}(X)$ with the topology of weak convergence. Given measurable $Y \subseteq X$, let $\mathfrak{P}(Y)$ denote the subset of probability measures on X that place probability one on Y. Let $\pi_i \in \mathfrak{P}(X)$ denote a mixed stationary proposal for i, and let $\pi = (\pi_1, \ldots, \pi_n)$ denote a profile of mixed stationary proposals. A mixed stationary strategy for i is a pair $\sigma_i = (\pi_i, A_i)$, and we let $\sigma = (\sigma_1, \ldots, \sigma_n)$ denote a profile of mixed stationary strategies. It is important to note that randomization takes place before voting. The individuals know which alternative has been proposed at the time they cast their votes.

Given a profile σ of mixed stationary strategies (π_i, A_i) , $i = 1, \ldots, n$, and given $C \subseteq N$, define the set

$$A_C = \bigcap_{i \in C} A_i$$

of proposals acceptable to all members of C, and define the social acceptance set

$$A = \bigcup_{C \in \mathbf{A}} A_C$$

which consists of proposals passed in any and all periods. The profile is a no-delay profile if $\pi_i(A) = 1$ for all $i \in N$ (implying, of course, that $A \neq \emptyset$). Let $S(\pi_i)$ denote the support of π_i , and let $S(\pi) = \bigcup_{i=1}^n S(\pi_i)$. We say σ has finite support if $S(\pi)$ is finite.

Informally, a profile σ^* constitutes a stationary equilibrium if, for all $i \in N$, π_n^* is optimal given the acceptance sets (A_1^*, \ldots, A_n^*) of the other individuals and A_i^* is optimal given that σ^* describes what would happen if the current proposal were rejected. To formalize these conditions, note first that any strategy profile σ defines in an obvious (if notationally dense) manner a probability distribution over the outcome space $(X \times \{1, 2, \ldots\}) \cup \{\emptyset\}$, and with it an expected utility $v_i(\sigma)$ for each $i \in N$ as evaluated at the beginning of the game; by stationarity this is also i's continuation value throughout the game, that is, i's expected utility as evaluated next period if the current period's proposal is rejected. In a no-delay stationary equilibrium, we can write the individual i's continuation value as

$$v_i(\pi) = \sum_{j \in N} \rho_j \left[\int_{\mathcal{X}} u_i(x) \pi_j(dx) \right],$$

a continuous function of π . That is, $v_i(\pi)$ is i's expected utility from the "continuation lottery," $\sum_{j \in N} \rho_j \pi_j$, associated with the profile of mixed proposals. In contrast, let

$$x(\pi) = \sum_{i \in N} \rho_i \left[\int_X x \pi_i(dx) \right]$$

denote the expected value of the individuals' proposals under the continuation lottery. By the concavity of u_i , we know that $u_i(x(\pi)) \ge v_i(\pi)$ in every no-delay stationary equilibrium, a feature that will prove quite useful below.

Formally, we require that the individuals' proposals satisfy sequential rationality and that their acceptance sets satisfy weak dominance, with the latter eliminating nasty equilibria in which, for instance, under majority rule everyone accepts $x \in X$ independently of preferences.⁵ The equilibrium condition on the acceptance sets is that for all $i \in N$,

$$[u_i(x) > \delta_i v_i(\sigma^*) \text{ implies } x \in A_i^*] \text{ and}$$

 $[u_i(x) < \delta_i v_i(\sigma^*) \text{ implies } x \notin A_i^*].$

³ Although LSWP is satisfied in divide-the-dollar environments, it does not hold for general linear u_i . For example, let n=2, X the unit ball in \Re^2 , where one individual has gradient (1,0) and the other has gradient (-1,0). Then, all points along the vertical axis are weakly preferred to the origin by both individuals, but because their gradients are exactly opposed, there are no alternatives that both strictly prefer to the origin.

⁴ That is, $S(\pi_i)$ is the intersection of all closed subsets Y of X such that $\pi_i(Y) = 1$.

⁵ Baron and Kalai (1993) refer to such strategies as "stage-undominated."

As for proposals, if A is nonempty, then individual i, when recognized as proposer, chooses either utility-maximizing outcomes from within A or an outcome that will be rejected, thereby generating a payoff of $\delta_i \nu_i(\sigma)$. Thus, the equilibrium condition on proposals is that for all $i \in N$,

$$\pi_i^*(\arg\max\{u_i(y)|y\in A^*\})=1$$

when $\sup\{u_i(y)|y\in A^*\} > \delta_i v_i(\sigma^*)$; that $\pi_i^*(XA^*) = 1$ when the inequality is reversed; and that π_i^* place positive mass only on the union of these two sets when equality holds.

THREE EXAMPLES

We offer a trio of three-person, majority-rule examples to illustrate several important properties of equilibrium behavior. In each, we assume equal recognition probabilities and common discount rates: $\rho_1 = \rho_2 = \rho_3 = \frac{1}{3}$ and $\delta_1 = \delta_2 = \delta_3 = \delta$.

Example 2. Let X = [-1, 1], and assume $u_1(x) = 2 - [-1 - x]$, $u_2 = 1 - |x|$, and $u_3 = 2 - |1 - x|$. That is, utility functions are negative one times Euclidean distance from the voters' ideal points (-1, 0, and1), plus constants to guarantee nonnegative utilities. We look for a symmetric equilibrium given by some $\alpha \in [0, 1]$, in which individual 1 proposes $p_1 = -\alpha$ if recognized, individual 2 proposes $p_2 = 0$ if recognized, and individual 3 proposes $p_3 = \alpha$ if recognized. Acceptance sets will be given by the discounted continuation values: Here, 1's and 3's continuation values are equal to one, and 2's is equal to $1 - 2\alpha/3$; after discounting, 1 accepts any $x \le 1 - \delta$, 2 accepts any $x \in$ $[-1+\delta-2\alpha\delta/3, 1-\delta+2\alpha\delta/3]$, and 3 accepts any $x \ge \delta - 1$. It is clear that $1 - \delta + 2\alpha \delta/3 \ge 1 - \delta$, so individual 3's optimal proposal will be the highest alternative (the one closest to 3's ideal point) that individual 2 will accept: $p_3 = 1 - \delta + 2\alpha \delta/3$. Using $p_3 = \alpha$, we solve these equations to find

$$\alpha = \frac{1-8}{1-\frac{2}{3}8}.$$

Given the proposal strategies specified above, the individuals vote to accept any alternatives that yield at least their discounted continuation values; and given the voting strategies specified above, the individuals' proposal strategies are indeed optimal. Thus, we have a stationary equilibrium.

Note that, in example 2, we have found an equilibrium in *pure* strategies, one that is actually continuous in the discount rate δ . Furthermore, $\alpha = 0$ when $\delta = 1$, which means every individual proposes the median (i.e., core) ideal point.

Example 3. Let X contain the unit simplex in \Re^3 ; let utility functions be quadratic, that is, $u_i(x) = k_i - ||x - x^i||^2$ where k_i is a constant term to guarantee nonnegative utilities; let ideal points x^1 , x^2 , x^3 be at the

respective unit coordinate vectors; and let $\delta=1$. This is pictured in Figure 1. As in Baron (1991), one mixed strategy equilibrium is given by $\pi_1^*(a)=\pi_1^*(b)=\frac{1}{2}$, $\pi_2^*(c)=\pi_2^*(d)=\frac{1}{2}$, and $\pi_3^*(e)=\pi_3^*(f)=\frac{1}{2}$, with acceptance sets circumscribed by indifference curves representing the individuals' continuation values; for example, individual 1's proposal strategy is optimal because a and b are equidistant from 1's ideal point, and because neither 2 nor 3 will accept any alternative closer to e^1 . Other strategies involving these six alternatives also yield stationary equilibria: Indeed, one pure strategy equilibrium is $\pi_1^*(a)=\pi_2^*(c)=\pi_3^*(e)=1$; another is $\pi_1^*(b)=\pi_2^*(d)=\pi_3^*(f)=1$.

Example 3 shows that no-delay stationary equilibria are not generally unique, but each individual's ex ante payoffs from the equilibria demonstrated are the same, which raises the issue of uniqueness of stationary equilibrium payoffs. While this property may hold in special environments (Eraslan 1999; Merlo and Wilson 1995), it does not hold generally. In our analysis of core equivalence, below, we give an example in which equilibria are not payoff equivalent, assuming $\delta = 1$. Our next example shows that nonunique equilibrium payoffs may occur even when all individuals' discount rates are below one.

Example 4. Let X be the unit simplex in \mathfrak{R}^3 , and assume $\mathfrak{d} = .95$. Again, we let individual *i*'s ideal point be at e^i , the *i*th unit vector, but now we define u_i by a particular monotonic transformation of Euclidean distance from e^i . Specifically, define the piecewise linear function f by

$$f(0) = 14,900$$
 $f(.25) = 14,894$ $f(.2762) = 14,890$
 $f(1.138) = 12,100$ $f(1.1642) = 12,000$ $f(1.2983) = 11,220$
 $f(1.3072) = 11,000$ $f(1.4142) = 0$

as in Figure 2.6 and define $u_i(x) = f(||e^i - x||)$, which is concave, strictly quasiconcave, and continuous. Consider a strategy profile in which individual 1 proposes a = (.8232, .1768, 0), 2 proposes b = (0, .8232, .1768), and 3 proposes c = (.1768, 0, .8232). Note that

$$u_1(a) = f(.25) = 14,894$$

 $u_1(b) = f(1.3072) = 11,000$
 $u_1(c) = f(1.1642) = 12,000$

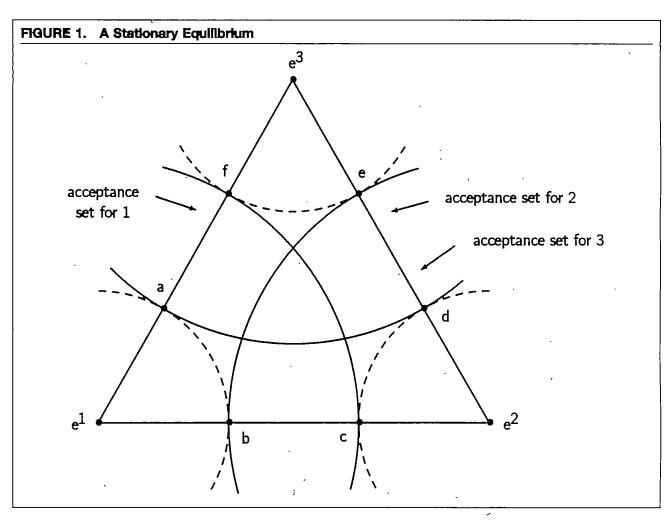

and that, by symmetry, the payoffs of 2 and 3 are merely permutations of those for 1. Individual 1's continuation value is

$$v_1 = \frac{1}{3} (14,894) + \frac{1}{3} (11,000) + \frac{1}{3} (12,000)$$
= 12,631,

and, by symmetry, $v_1=v_2=v_3$. Noting that $\delta_1v_1=12,000$, we define 1's acceptance set as

$$A_1 = \{x \in X | u_1(x) \ge 12,000\},\$$

⁶ The figure is meant to illustrate the definition of the function f. It is not drawn true to any linear scale.

with A_2 and A_3 defined symmetrically. Proposal a gives individual 2 a payoff of exactly 12,000, which is the minimum needed to acquire 2's approval. Thus, 1's strategy is a best response, as are those of 2 and 3, and we have a no-delay stationary equilibrium.

Now consider a strategy profile in which individual 1 proposes a' = (.8047, .1953, 0), 2 proposes b' = (0, .8047, .1953), and 3 proposes c' = (.1953, 0, .8047). Note that

$$u_1(a') = f(.2762) = 14,890$$

 $u_1(b') = f(1.2983) = 11,220$
 $u_1(c') = f(1.138) = 12,100$

and that, again, the payoffs of 2 and 3 are merely permutations of those for 1. Individual 1's continuation value is

$$v_1' = \frac{1}{3} (14,890) + \frac{1}{3} (11,220) + \frac{1}{3} (12,100)$$

= 12,737,

and $v_1' = v_2' = v_3'$. Noting that $\delta_1 v_1' = 12,100$, we define 1's acceptance set as

$$A_1' = \{x \in X | u_1(x) \ge 12,100\},\$$

with A'_2 and A'_3 defined symmetrically. Proposal a' gives 2 a payoff of exactly 12,100, which is the minimum

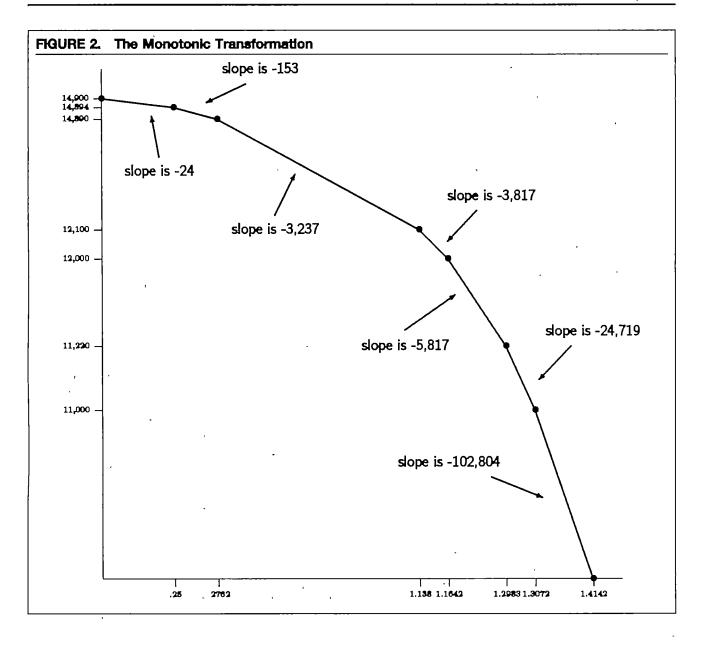

needed to acquire 2's approval. Thus, 1's strategy is a best response, as are those of 2 and 3, giving us a no-delay stationary equilibrium with continuation payoffs distinct from those just identified.

EXISTENCE AND CONTINUITY

In each of the examples in the previous section, a no-delay stationary equilibrium exists. Our first theorem establishes this as a general result.

THEOREM 1. (i) If $\delta_i < 1$ for all $i \in N$ or if LSWP holds, then there exists a no-delay stationary equilibrium. (ii) If $\delta_i < 1$ for all $i \in N$, then every stationary equilibrium is a no-delay equilibrium. (iii) If each u_i is strictly quasiconcave, then every no-delay stationary equilibrium has finite support.

Proof: For all $\pi \in [\mathfrak{P}(X)]^n$ and all $i \in N$, define $A_i(\pi) = \{x \in X | u_i(x) \geq \delta_i v_i(\pi)\}$. By concavity of u_i , by $u_i(x) \geq 0$ for all $x \in X$, and by $\delta_i \leq 1$, we have $x(\pi) \in A_i(\pi)$, and therefore $A_i(\pi)$ is nonempty. It is compact by the continuity of u_i , and it is convex by the concavity of u_i . For all $C \in \mathfrak{D}$, define $A_C(\pi) = \bigcap_{i \in C} A_i(\pi)$, also nonempty, compact, and convex; and define $A(\pi) = \bigcup_{C \in \mathfrak{D}} A_C(\pi)$, which is nonempty and compact but not necessarily convex. Theorem 7, in the Appendix, establishes that A is continuous as a corre-

spondence on $[\mathcal{P}(X)]^n$ if either $\delta_i < 1$ for all $i \in N$ or LSWP holds. To prove (i), define $M_i(\pi) = \arg M_i(\pi)$ $\max\{u_i(x)|x\in A(\pi)\}\$ for all $i\in N$. By the Theorem of the Maximum (Aliprantis and Border 1994, Theorem 14.30), $M_i: [\mathfrak{P}(X)]^n \longrightarrow X$ has nonempty and compact values and is upper hemicontinuous; but, it is not necessarily convex-valued, since $A(\pi)$ is not necessarily convex. Let $B_i(\pi) = \mathcal{P}(M_i(\pi))$ denote the set of mixtures of optimal proposals, which defines a nonempty, compact- and convex-valued, upper hemicontinuous correspondence (Aliprantis and Border 1994, Theorem 14.14). Define the correspondence B: $[\mathfrak{P}(X)]^n \longrightarrow [\mathfrak{P}(X)]^n$ by $B(\pi) = B(\pi) =$ $B_1(\pi) \times \ldots \times B_n(\pi)$; since $[\mathfrak{P}(X)]^n$ is compact and convex, by Glicksberg (1952) B has a fixed point, say, $\pi^* = (\pi_1^*, \ldots, \pi_n^*)$. Then π^* , together with acceptance sets $A_i^* = A_i(\pi^*)$, $i = 1, \ldots, n$, constitutes an equilibrium. To prove (ii), let σ^* be a stationary equilibrium. In step 7 of the proof of theorem 7, in the Appendix, we prove the existence of $x \in X$ such that,

for all $i \in N$, $u_i(\hat{x}) > \delta_i v_i(\pi^*)$. By weak dominance, $\hat{x} \in A^*$. Then

$$\sup\{u_i(y)|y\in A^*\}>\delta_i\nu_i(\pi^*),$$

and sequential rationality requires π_i^* put probability one on arg $\max\{u_i(y)|y\in A^*\}$ for all $i\in N$. In particular, $\pi_i^*(A^*)=1$ for all $i\in N$. To prove (iii), let σ^* be a no-delay stationary equilibrium. Each A_i^* is convex by strict quasiconcavity and weak dominance, and therefore each A_C^* is convex. Optimality of i's proposals requires that π_i^* put probability one on arg $\max\{u_i(y)|y\in A^*\}$, which can be rewritten

$$\arg\max\{\arg\max\{u_i(y)|y\in A_C^*\}|C\in\mathfrak{D}\}.$$

By convexity of A_C^* and strict quasiconcavity of u_i , arg $\max\{u_i(y)|y\in A^*\}$ is a singleton. Since $\mathfrak B$ is finite, the result is proved. Q.E.D.

A few remarks are in order. First, by definition, in no-delay equilibria the first proposal is always accepted, so there is no inefficiency due to delay. If some individuals make distinct proposals with positive probability, however, and if utility functions are strictly concave, then there will be ex ante inefficiency due to uncertainty.

Second, our presentation of the model and the proof of theorem 1 require only notational changes if we generalize the voting rule to a collection $\{\mathfrak{D}_i\}_{i\in N}$, where \mathfrak{D}_i is the nonempty, monotonic collection of coalition, that can pass a proposal from individual i. Let $A^i = \bigcup_{C \in \mathfrak{D}_i} A_C$ consist of the proposals i can pass. In the proof, we would define $A^i(\pi)$ accordingly, and we would define $M_i(\pi) = \arg\max\{u_i(x)|x \in A^i(\pi)\}$, restricting i's proposals to those the individual can pass; we again find a fixed point of the correspondence B, defined as in the proof of theorem 1, giving us a no-delay stationary equilibrium.

Third, the fixed points of B are all the no-delay stationary equilibrium proposals if each $\delta_i < 1$ or if LSWP holds. That is, in any such equilibrium, individual i's mixed proposal strategy must put probability one on the utility-maximizing alternatives in $A(\pi)$, defined in the proof of theorem 1. Indeed, consider a no-delay stationary equilibrium with proposals given by profile π° and acceptance sets $\{A_i^{\circ}\}$. Thus, $\pi_i^{\circ}(A^{\circ}) = 1$ for all $i \in N$. By weak dominance, $A_i^{\circ} \subseteq A_i(\pi^{\circ})$ for all $i \in N$, implying $A^{\circ} \subseteq A(\pi^{\circ})$. In equilibrium, individual j must put probability one on the utility-maximizing proposals in A° , but it is conceivable that these proposals are not utility maximizing in $A(\pi^{\circ})$. Let x' and C' satisfy $x' \in A_{C'}(\pi^{\circ})$, $C' \in \mathfrak{D}$, and $u_j(x') = \max\{u_j(x)|x \in A(\pi^{\circ})\}$.

In steps 8 and 9 of the proof of theorem 7, in the Appendix, we prove that one of two cases obtains. First, it may be that LSWP holds and $|A_{C'}(\pi^\circ)| = 1$. Second, it may be that $A_{C'}(\pi^\circ) \subseteq \overline{A_{C'}^I(\pi^\circ)}$, that is, for all $x \in A_{C'}(\pi^\circ)$, there is a sequence $\{x_k\}$ such that $x_k \to x$ and each x_k gives the members of C' strictly more than their discounted continuation value. In the second case, weak dominance implies $x_k \in A_{C'}^{\circ}$ for all k. By continuity of u_j , individual j can pass proposals with utility arbitrarily close to $u_i(x')$. Therefore, in equilibrium, π_i° must put probability one on arg max $\{u_i(x)|x\in$ $A^{\circ}(\pi^{\circ})$. In the first case, $|A_{C'}(\pi^{\circ})| = 1$, and it follows from concavity of the u_i that $A_{C'}(\pi^{\circ}) = \{x(\pi^{\circ})\}$ and that $x' = x(\pi^{\circ})$. If $|A_C(\pi^{\circ})| > 1$ for any $C \in \mathfrak{D}$, step 9 in the proof of theorem 7 establishes the existence of a sequence $\{x_k\}$ in $P_C(x(\pi^\circ))$ converging to x'. Since $P_C(x(\pi^\circ)) \subseteq A_C^*(\pi^\circ)$, weak dominance implies $x_k \in A_C^*$ for all k. Thus, individual j can again pass proposals with utility arbitrarily close to $u_i(x')$. If $|A_C(\pi^\circ)| = 1$ for all $C \in \mathfrak{D}$, then $A(\pi^{\circ}) = \{x(\pi^{\circ})\}$. Since A° is a nonempty subset of $A(\pi^{\circ})$, it follows that $A^{\circ} = \{x'\}$ and that individual j can pass x'.

Last, if $\delta_l = 1$ for some individuals, then there can exist stationary equilibria with delay. Let n = 2 and $\mathfrak{D} = \{N\}$; let $x \in X$ be Pareto optimal for individuals 1 and 2; let $y \in X$ be such that $u_2(x) > u_2(y)$; and let $\rho_1 = 1$. In each period, individual 1 proposes x with probability $\frac{1}{2}$ and y with probability $\frac{1}{2}$; and individual

2 rejects any $z \in X$ such that $u_2(z) < u_2(x)$. Then, since x is Pareto optimal, it is the best 1 can do given 2's acceptance set; and with probability one x is proposed in finite time, so i receives utility of $u_i(x)$.

Because the set A of socially acceptable proposals need not be convex, even in equilibrium (as in Figure 1), mixed strategies are required in the proof of theorem 1 to convexify the individuals' best responses. This is not a problem if we impose certain restrictions, on either the voting rule or the dimension of the set of alternatives, that deliver convexity of A. An implication of the next result is that the existence of pure strategy no-delay stationary equilibria, as in example 2, holds generally when X is one dimensional.

THEOREM 2. Assume either \mathfrak{D} is oligarchic or d=1. (i) If $\delta_i < 1$ for all $i \in N$ or if LSWP holds, then there exists a pure strategy no-delay stationary equilibrium. (ii) If each u_i is strictly quasiconcave, then every no-delay stationary equilibrium is in pure strategies.

Proof: If \mathfrak{D} is oligarchic, let $C' = \bigcap_{\mathfrak{D}} C$. Then $A(\pi)$, defined in the proof of theorem 1, is just $\bigcap_{i \in C'} A_i(\pi)$, a convex set. We claim $A(\pi)$ is also convex if d = 1. Let $\bar{x} = \max A(\pi)$ and $\bar{x} = \min A(\pi)$, which exist by compactness of X and continuity of the u_i , and let Cand \underline{C} satisfy $\bar{x} \in A_{\underline{C}}(\pi)$ and $\underline{x} \in A_{\underline{C}}(\pi)$. Clearly, $x(\pi) \in [\underline{x}, \overline{x}] = \operatorname{conv} A(\pi)$ and, by concavity, $x(\pi) \in$ $A_{\mathcal{C}}(\pi) \cap A_{\mathcal{C}}(\pi)$. Take any $y \in \operatorname{conv} A(\pi)$. Suppose $y \in [x, x(\pi)]$. Since $A_{\mathcal{L}}(\pi)$ is convex, by concavity, we have $y \in A_{\mathcal{C}}(\pi) \subseteq \overline{A}(\pi)$. A symmetric argument addresses the case $y \in [x(\pi), \bar{x}']$. To prove (i), we can simply revise the argument in the proof of theorem 1 (i) using only pure strategies. Since $A(\pi)$ is convex, it follows that $M_i(\pi)$, defined there, is convex-valued for all $i \in N$. Therefore, there exists a pure strategy no-delay stationary equilibrium. To prove (ii), recall the third remark after the proof of theorem 1: Under our assumptions, every no-delay stationary equilibrium σ^* is such that each π_i^* puts probability one on arg $\max\{u_i(x)|x\in A(\pi^*)\}$. Since $A(\pi^*)$ is convex and u_i is strictly quasiconcave, arg max $\{u_i(x)|x\in A(\pi^*)\}$ is a singleton, so π_i^* is a pure strategy.

The equilibrium identified in example 2 is clearly continuous in the common discount rate of the individuals. We now take up the continuity issue in more depth. The stationary equilibria of our model are parameterized by the individuals' recognition probabilities, $\rho = (\rho_1, \ldots, \rho_n) \in \Delta$, and their discount factors, $\delta = (\delta_1, \ldots, \delta_n) \in [0, 1]^n$. To these we add information about their utility functions. Let $\Lambda \subset \Re^k$ be a set parameterizing profiles of utility functions, so the individuals' preferences can be represented as $u_i(x) = u_i(x, \lambda)$ for some $\lambda \in \Lambda$. Assume that each u_i is jointly continuous in (x, λ) ; that, for all $\lambda \in \Lambda$, each $u_i(\cdot, \lambda)$ is concave and nonnegative; and that, for all $\lambda \in \Lambda$, there exists $x \in X$ such that, for all $i \in N$, $u_i(x, x)$ λ) > 0. As examples of such parameterizations, we could have $\Lambda \subseteq \Re^{nd}$, $\lambda = (\lambda_1, \dots, \lambda_n) \in \Lambda$, with each λ_i representing the ideal point of a quadratic utility function for individual i; or, more generally, λ_i

might be the matrix-defining weighted Euclidean distance utilities (Hinich and Munger 1997); alternatively, preferences could be represented in a general separable form (Caplin and Nalebuff 1991),

$$u_i(x, \lambda) = \sum_{h=1}^m \lambda_i^h t^h(x) + t^{m+1}(x),$$

where $t^h: X \to \Re$ is continuous and strictly concave for h = 1, 2, ..., m + 1.

For parameters ρ , δ , and λ , let $E(\rho, \delta, \lambda)$ denote the set of no-delay stationary equilibrium mixed proposal profiles given by the fixed points of the correspondence B, defined in the proof of theorem 1. As discussed above, if discount rates are all less than one or if LSWP holds, then $E(\rho, \delta, \lambda)$ consists of all no-delay stationary equilibrium profiles of proposals. We say that E is upper hemicontinuous at (ρ, δ, λ) if, for every open set $Y \subseteq [\mathcal{P}(X)]^n$ with $E(\rho, \delta, \lambda) \subseteq Y$, there exists an open set $Z \subseteq \Delta \times [0, 1]^n \times \Lambda$ with $(\rho, \delta, \lambda) \in Z$ such that, for all $(\rho', \delta', \lambda') \in Z$, $E(\rho', \delta', \lambda') \subseteq Y$. In words, "small" variations in (ρ, δ, λ) cannot lead the set of equilibrium outcomes to enlarge discontinuously.

THEOREM 3. If either $\delta_i < 1$ for all $i \in N$ or LSWP holds at λ , then E is upper hemicontinuous at (ρ, δ, λ) .

Proof: Given parameters ρ , δ , and λ satisfying the assumptions of the theorem and given a profile π of mixed stationary proposals, let θ denote the vector $(\rho, \delta, \lambda, \pi)$. Define

$$A_{\iota}(\theta) = \{x \in X | u_{\iota}(x, \lambda) \geq \delta_{\iota} v_{\iota}(\pi, \rho, \lambda)\},\$$

where $v_i(\pi, \rho, \lambda)$ is i's continuation value, defined as above but using $u_i(\cdot, \lambda)$. Theorem 7, in the Appendix, establishes that A is continuous as a correspondence at θ . Hence, by the Theorem of the Maximum,

$$M_i(\theta) = \arg\max\{u_i(x, \lambda)|x \in A(\theta)\}$$

is upper hemicontinuous at θ , and therefore so is $B_i(\theta) = \mathcal{P}(M_i(\theta))$. Since B_i has closed values and regular range as well, it has closed graph (Aliprantis and Border 1994, Theorem 14.11). Now, let $(\rho^m, \delta^m, \lambda^m) \to (\rho^o, \delta^o, \lambda^o)$, and take any sequence $\{\pi^m\}$ such that $\pi^m \in E(\rho^m, \delta^m, \lambda^m)$ for all m. Suppose $\pi^m \to \pi^o$. Since $\pi_i^m \in B_i(\theta^m)$ for all m and since B_i has closed graph, we see that $\pi_i^o \in B_i(\theta^o)$ for all $i \in N$. Therefore, $\pi^o \in E(\rho^o, \delta^o, \lambda^o)$, and we conclude that E has closed graph at θ . Since it has compact Hausdorff range space as well, it is upper hemicontinuous at θ (Aliprantis and Border 1994, Theorem 14.12). Q.E.D.

As applications, note that when $\delta_i = 0$ for all $i \in N$, the individuals will propose their ideal points when recognized; by theorem 3, therefore, when discount rates are all close to zero, each proposal will be close to the proposer's ideal point. Similarly, when $\rho_i = 1$, as in the model of Romer and Rosenthal (1978a, 1978b), we can easily solve for the equilibrium proposals for i; and when ρ_i is close to one, the individual's proposals will be close to that when ρ_i equals one, and hence the

expected outcome will be close to the original. Finally, suppose all equilibrium proposals actually coincide at the point x^* for some λ^* ; then, for all values of λ close to λ^* , all equilibrium proposals will be close to x^* .

CORE EQUIVALENCE

We now examine conditions under which the stationary equilibrium outcomes of our model coincide with the unbeaten, or "core," alternatives, as they do in example 2. We assume throughout that each u_i is strictly quasiconcave, so LSWP holds, and, from theorem 1 (iii), every stationary equilibrium has finite support; that each $\rho_i > 0$, which implies all individuals have some chance of being recognized; and that each $\delta_i = 1$, which implies all individuals are perfectly patient. In addition, we assume that \mathfrak{D} is proper. Define the *core* of the voting rule \mathfrak{D} , denoted \mathfrak{K} , as

$$\mathfrak{K} = \{x \in X | y \in P_C(x) \text{ for no } (C, y) \in \mathfrak{D} \times X\}.$$

The next example illustrates the concept of the core for the voting rule from example 1 for different values of the quota q.

Example 5. Let n = 5 and $X = [-1, 1]^2$, and assume each u_i is quadratic, with ideal points arranged in a pentagon, as in Figure 3. We suppose that D is a weighted q-rule with weights from example 1, so the ideal points of the large individuals, 1 and 2, are at nonadjacent corners of the pentagon. When $q \in (0,$.55], the core is empty: Since {1, 4, 5} is decisive, any core point would be in the triangle given by the three individuals' ideal points; similarly, it would be in the {2, 3, 4}-triangle, and it would be on the contract curve between 1's and 2's ideal points, but these sets have empty intersection. When $q \in (.55, .65]$, the core is now nonempty; because these points are Pareto optimal for 3, 4, and 5, the core is the thick portion of the contract curve for 1 and 2. When $q \in (.65, .8]$, the core increases to the entire contract curve for 1 and 2: For $q \in (.65, .7]$, 1 and 2 are oligarchs, and the claim is clear; for $q \in (.7, .8]$, any core point has to be in the $\{1, 2, 3\}$ -triangle and the $\{1, 2, 4\}$ -triangle, which

leaves only the contract curve. When $q \in (.8, .9]$, the core increases to the shaded triangle: These points are no longer upset by the coalition $\{1, 2, 3\}$, as this coalition is no longer decisive. Finally, when $q \in (.9, 1]$, the rule is equivalent to unanimity rule, and the core consists of the entire pentagon.

Our first lemma establishes one inclusion of the desired equivalence, namely, that every core alternative is the unique outcome of some stationary equilibrium. Furthermore, it establishes that a stationary equilibrium has a unique outcome only if that outcome is in the core. Indeed, it is clear from the proof of the lemma that the latter implication does not rely on strict quasiconcavity. In what follows we will denote pure strategy profiles of proposals by $p = (p_1, \ldots, p_n)$.

Lemma 1. $p_1^* = \cdots = p_n^* = x^*$ are no-delay stationary equilibrium proposals if and only if $x^* \in \mathcal{K}$.

Proof: Assume $p_1^* = \cdots = p_n^* = x^*$ are no-delay stationary equilibrium proposals. If $x^* \notin \mathcal{H}$, then there exists $C \in \mathfrak{D}$ and $y \in P_C(x^*)$, which implies $u_i(y) > u_i(x^*) = \delta_i v_i(\pi^*)$ for all $i \in C$. By weak dominance, $y \in A_i^*$ for all $i \in C$, and hence $y \in A^*$. Thus, when selected to propose, individual $i \in C$ gets a strictly higher payoff from proposing y than from proposing x^* , a contradiction. Now assume $x^* \in \mathcal{H}$. Setting $p_i^* = x^*$ and $A_i^* = R_i(x^*)$ for all $i \in N$, we claim that $((A_1^*, p_1^*), \ldots, (A_n^*, p_n^*))$ is a no-delay stationary equilibrium. The acceptance sets clearly satisfy weak dominance, so if this is not an equilibrium, then there must exist an individual with a better acceptable proposal. But if there exists $z \neq x^* \in X$ such that $z \in A_C^*$ for some $C \in \mathfrak{D}$, then $\frac{1}{2}x^* + \frac{1}{2}z \in P_C(x^*)$ by strict quasiconcavity, which contradicts $x^* \in \mathcal{H}$.

The next lemma reveals a connection between the structure of the set of no-delay stationary equilibrium proposals and the structure of the voting rule. Define the *Nakamura number* of \mathfrak{D} , denoted \mathcal{N} , as

$$\mathcal{N} = \min\{|\mathcal{G}||\mathcal{G}\subseteq\mathfrak{D} \text{ and } \bigcap_{c\in\mathcal{G}} C=\emptyset\}$$

if \mathfrak{D} is not collegial, and define $\mathcal{N}=\infty$ if it is. In words, when \mathfrak{D} is not collegial, the Nakamura number of \mathfrak{D} is the size of the smallest collection of decisive coalitions having empty intersection; and when \mathfrak{D} is collegial, it suffices here to assign it any infinite cardinality. If \mathfrak{D} is proper, as we now assume, then $\mathcal{N} \geq 3$; and if \mathfrak{D} is noncollegial, then $\mathcal{N} \leq n$. Given a subset $Y \subseteq X$ and $x \in Y$, say that x is an extreme point of Y if there do not exist distinct $y, z \in Y$ and $\alpha \in (0, 1)$ such that $x = \alpha y + (1 - \alpha)z$, that is, if it cannot be written as the convex combination of distinct elements of Y.

LEMMA 2. Let $\sigma^* = ((A_1^*, \pi_1^*), \ldots, (A_n^*, \pi_n^*))$ be a no-delay stationary equilibrium. If $S(\pi^*)$ has more than one extreme point, then the set of extreme points of $S(\pi^*)$ has cardinality at least \mathcal{N} .

Proof. Suppose that $S(\pi^*)$ has more than one extreme point, yet the cardinality of the set of extreme points is less than \mathcal{S} . From theorem 1, strict quasiconcavity implies that $S(\pi^*)$ is finite and, therefore, has a

finite number of extreme points. Denumerate the set of extreme points of $S(\pi^*)$ as x_1, x_2, \ldots, x_m , and define $C_h = \{i \in N | x_h \in A_i^*\}$, $h = 1, \ldots, m$. Since σ^* is a no-delay equilibrium, we have $C_h \in \mathfrak{D}$ for all h. Then, by definition of the Nakamura number, there is some $j \in \bigcap_{h=1}^m C_h$. That is, there is some j such that, for all $h, x_h \in A_j^*$. We claim that $u_j(x) = u_j(y)$ for all $x, y \in S(\pi^*)$. Otherwise,

$$\bar{u} = \max\{u_i(x)|x \in S(\pi^*)\} > \min\{u_i(x)|x \in S(\pi^*)\} = u,$$

and furthermore, by the Bauer Maximum Principle (Aliprantis and Border 1994, Theorem 4.104), μ is achieved at an extreme point of $S(\pi^*)$, say, x_k . But, since $\delta_j = 1$, this means that j's acceptance set violates weak dominance: $\rho_i > 0$ for all $i \in N$ implies $\mu < \infty$ $v_j(\pi^*)$, so in equilibrium we must have $x_k \notin A_i^*$. This contradiction establishes the claim. Next, note that, by concavity of the u_i , $u_i(x(\pi^*)) \ge v_i(\pi^*)$ for all $i \in N$. Since $x_1 \in A_{C_1}^*$, strict quasiconcavity and the weak dominance condition on $A_{C_1}^*$ imply that the convex hull of $\{x_1, x(\pi^*)\}$ is included in $A_{C_1}^*$. Then, because π_i^* is a best-response proposal strategy for j, continuity of u_i implies that there exists $x^* \in A^*$ such that $u_i(x^*) \ge$ $u_i(x(\pi^*))$. Now, by the Krein-Milman Theorem (Aliprantis and Border 1994, Theorem 4.103), we know that $x(\pi^*)$, since it is an element of the convex hull of $S(\pi^*)$, can be written as a convex combination of the extreme points of $S(\pi^*)$, which, we may suppose, places positive weight on the first h extreme points. Since $S(\pi^*)$ contains more than one element and $\rho_i >$ 0 for all $i \in N$, $x(\pi^*)$ cannot itself be an extreme point. Thus, h > 1. Then strict quasiconcavity and $u_j(x_1) = \cdots = u_j(x_k)$ yield $u_j(x(\pi^*)) > u_j(x_1)$. In equilibrium, j must propose alternatives with utility of at least $u_j(x^*) \ge u_j(x(\pi^*)) > u_j(x_1)$. But $\rho_j > 0$, so j's proposals are elements of $S(\pi^*)$, which contradicts the claim that j's utility is constant on $S(\pi^*)$.

Nakamura (1979) introduced the concept of the Nakamura number in his analysis of core nonemptiness in the absence of convexity restrictions, while Schofield (1984) and Strnad (1985) assume convexity of X and impose a weak convexity condition on preferences. They prove that the core is nonempty if $d \leq \mathcal{N} - 2$ and that, otherwise, there exist profiles of preferences for which the core is empty. As special cases, the core is nonempty if d=1 (since $\mathcal{N} \geq 3$) or if \mathfrak{D} is collegial (since $\mathcal{N} = \infty$). These two cases play analogous roles in the analysis of this section, as each provides sufficient structure for the existence of pure strategy stationary equilibria and equivalence with core outcomes.

If \mathfrak{B} is collegial, so that \mathcal{N} is infinite, then it is clear that the cardinality of the set of extreme points of $S(\pi^*)$, finite from theorem 1 (iii), cannot exceed \mathcal{N} . From lemma 2, therefore, $S(\pi^*)$ has at most one extreme point. Since it is finite and nonempty, it has exactly one, say, x^* . From lemma 1, therefore, we have $x^* \in \mathcal{H}$, which proves the following result.

THEOREM 4. If \mathfrak{D} is collegial, then all no-delay stationary equilibria are in pure strategies and are of the form $p_1^* = \cdots = p_n^* = x^*$ for some $x^* \in \mathfrak{K}$.

Thus, using lemma 1, we have full equivalence between the core of the underlying voting rule and the no-delay stationary equilibrium bargaining outcomes when individuals are perfectly patient and the voting rule $\mathfrak D$ is collegial. As an application, this yields an exact characterization of the no-delay stationary equilibria in example 5 for $q \in (.65, 1]$ when discount rates all equal one; for example, for $q \in (.8, .9]$ they coincide with the shaded triangle in Figure 3. Using theorem 3, we have a partial characterization as discount rates converge to one. Adding theorem 2 when $\mathfrak D$ is oligarchical, all no-delay stationary equilibria are in pure strategies for all discount rates, and pure strategy equilibrium proposals converge to the core as discount rates converge to one.

If d=1, then the set of extreme points of $S(\pi^*)$ has at most two elements. Since \mathfrak{D} is proper, however, $\mathcal{N} \geq 3$, and from lemma 2 we then know that $S(\pi^*)$ has at most one extreme point. Again, because $S(\pi^*)$ is finite and nonempty, we conclude that it has exactly one, say, x^* . From lemma 1, therefore, we have $x^* \in \mathcal{H}$, which proves the following result and generalizes the core equivalence seen in example 2.

THEOREM 5. If d=1, then all no-delay stationary equilibria are in pure strategies and are of the form $p_1^* = \cdots = p_n^* = x^*$ for some $x^* \in \mathcal{K}$.

Thus, when the alternative space has but a single dimension and individuals are perfectly patient, we again have full equivalence between the core of the underlying voting rule and the no-delay stationary equilibrium bargaining outcomes. When applied to majority-rule bargaining, a consequence of theorem 5 is that our model replicates the predictions of the Median Voter Theorem (Black 1958; Downs 1957) when individuals are perfectly patient. Using theorems 2 and 3, all no-delay stationary equilibria are in pure strategies for all discount rates, and pure strategy equilibrium proposals converge to the core (the medians under majority rule) as discount rates converge to one.

Now, suppose in addition that the core of D is actually a singleton. Then we also can conclude that, as the discount rates converge to one, all the equilibrium bargaining proposals collapse down to a single point in the space. Therefore, even if there are multiple equilibria when discount rates are less than one, the equilibrium proposals will be close to one another when those discount rates are close to one. A sufficient condition for the core (when nonempty) to be a singleton, given our assumption of strictly quasiconcave utilities, is that 20 is strong. Majority rule is an example of a strong rule when n is odd, and in that case the core consists of the (uniquely defined) median ideal point. Thus, in that case, the stationary equilibrium outcomes of our model will lie within arbitrarily small neighborhoods of the median as discount rates go to one.7

Given theorems 4 and 5 and the results of Schofield

(1984) and Strnad (1985), one might conjecture that core equivalence holds whenever $d \leq \mathcal{N} - 2$. To see that conjecture is false, consider the following example.

Example 6. Let n = 4, $X = [-1, 1]^2$, and $\rho_i = \frac{1}{4}$ for all $i \in N$, and assume each u_i is quadratic (ignoring the constant term). Let the ideal points of individuals 1 through 4 be given by (1, 0), (0, 1), (-1, 0), and (0, -1), respectively. Under majority rule there is a unique core point at (0, 0); however, consider the proposals $p_1 =$ $(\alpha, 0), p_2 = (0, \alpha), p_3 = (-\alpha, 0), \text{ and } p_4 = (0, -\alpha),$ where $\alpha \in (0, 1]$. Quadratic utility implies meanvariance analysis; given that the mean of these four (equally weighted) proposals is (0, 0) and the variance is α^2 , individual i's continuation value is equal to -1 α^2 . Consider the utility to individuals 2 and 4 from the proposal p_1 ; by the Pythagorean Theorem this is equal to $-1 - \alpha^2$, and so these two individuals are indifferent between accepting and rejecting p_1 , and thus accepting is a best response. A similar logic holds for proposals p_2 , p_3 , and p_4 , which thereby guarantees that each proposal will pass. Furthermore, given the continuation values, it is clear that these are utility-maximizing choices for the proposers. Thus, we have a stationary equilibrium away from the core (in fact, a continuum of them, parameterized by α).

The "problem" in the preceeding example is that the core is not associated with any one individual's ideal point and so is not offered as a proposal. To illustrate, suppose there is now a fifth individual with quadratic preferences and ideal point at (0, 0). The majority rule core remains at (0, 0), but now, as long as ρ_5 is strictly positive, this core point can have some influence on the individuals' behavior. In particular, the above proposals for individuals 1 through 4, along with $p_5 = (0, 0)$, do not constitute an equilibrium, even with ρ₅ arbitrarily small (and the other recognition probabilities equal to $(1 - \rho_5)/4$). To see this, note that the mean of the proposals has not changed; the variance has strictly decreased below α^2 , however, and by offering $p_1 = (\alpha,$ 0) individual 1 will acquire the votes of no other individual. The only equilibrium in example 6, so augmented, is at the core point, as in theorems 4 and 5.8 The next theorem subsumes this observation as a special case of a general result on quadratic preferences and strong voting rules.

THEOREM 6. If \mathfrak{D} is strong, if u_i is quadratic for all $i \in N$, and if $\mathfrak{H} = \{x^*\}$ with $x^* \in \text{int}X$, then all no-delay stationary equilibria are in pure strategies and are of the form $p_1^* = \cdots = p_n^* = x^*$.

Proof: Let $u_i(x) = -\|x - x^i\|^2$ for all $i \in N$, and let σ^* be a no-delay stationary equilibrium. The proof proceeds in a number of steps.

⁷ Analogous results employing theorem 4 are less interesting, as the only strong collegial rule turns out to be dictatorship.

⁸ Note that this example demonstrates a violation of lower hemicontinuity of E in ρ : When $\rho_5 = 0$, example 6 demonstrates a continuum of equilibrium outcomes, but the core is the only one that can be reached as the limit of equilibrium outcomes when all recognition probabilities are positive.

(1) \mathfrak{B} strong, u_i quadratic, and $\{x^*\} = \mathfrak{K}$ with $x \in \operatorname{int} X$ imply $x^* = x^i$ for some $i \in N$. If not, $\nabla u_i(x^*) \neq 0$ for all $i \in N$, so let H be a hyperplane, with normal p, through zero containing no gradient vector. Since \mathfrak{B} is strong, either

$$\{i \in N | \nabla u_i(x^*) \cdot p > 0\}$$
 or $\{i \in N | \nabla u_i(x^*) \cdot p < 0\}$

is decisive. Suppose the former, without loss of generality. Since $x^* \in \text{int} X$, there exists $\varepsilon > 0$ such that $x^* + \varepsilon p \in X$ and for all members i, $u_i(x^* + \varepsilon p) > u_i(x^*)$. Thus, $x^* \notin \mathcal{H}$, a contradiction.

(2) $\{i \in N | u_i(x^*) \ge u_i(x(\pi^*))\} \in \mathfrak{D}$. If not, since \mathfrak{D} is strong, its complement is decisive, implying $x^* \notin \mathfrak{K}$, a contradiction.

(3) $x^* \in A^*$. If not, $C = \{i \in N | x^* \in A_i^*\} \notin \mathfrak{D}$, and by \mathfrak{D} strong $N \setminus C \in \mathfrak{D}$. By weak dominance, $u_i(x^*) \leq v_i(\pi^*)$ for all $i \in N \setminus C$; then concavity yields $u_i(x^*) \leq u_i(x(\pi^*))$ for all $i \in N \setminus C$. If $|S(\pi)| > 1$, these inequalities hold strictly, but then $x \notin \mathcal{H}$, a contradiction. The remaining case is $|S(\pi)| = \{y\}$ for some $y \in X \setminus \{x\}$, but then $\frac{1}{2}x^* + \frac{1}{2}y \in P_{N \setminus C}(x^*)$ and $x \notin \mathcal{H}$, a contradiction.

(4) Letting individual 1 be such that $x^* = x^1$, $S(\pi_1^*) = \{x^*\}$. This follows directly from step 3 and the definition of stationary equilibrium

the definition of stationary equilibrium.

Let $\underline{x} \in \arg\min\{u_1(x)|x \in S(\pi^*)\}$, which is well-defined by theorem 1 (iii). Suppose, in order to deduce a contradiction, that $\underline{x} \neq x^*$, that is, $|S(\pi^*)| > 1$

- (5) $u_1(\underline{x}) < v_1(\pi^*)$. This follows from $p_1^* = x^*$ and $o_1 > 0$.
 - (6) x^* is a total median. In particular, the coalition

$$D = \{i \in N | (x^{i} - x^{*}) \cdot (x(\pi^{*}) - \underline{x}) \ge 0\}$$

is decisive. Otherwise, by \mathfrak{D} strong, $ND \in \mathfrak{D}$; but because $x^* \in \text{int} X$ and the u_i are quadratic, we could then take $\varepsilon > 0$ small enough that

$$x^* + \varepsilon(x - x(\pi^*)) \in P_{ND}(x^*)$$

and $x^* \notin \mathcal{H}$, a contradiction.

(7) For all $i \in D$,

$$||x^{t} - x(\pi^{*})||^{2} - ||x^{t} - \underline{x}||^{2}$$

$$= -2x^{t} \cdot (x(\pi^{*}) - \underline{x}) + x(\pi^{*}) \cdot x(\pi^{*}) - \underline{x} \cdot \underline{x}$$

$$\leq -2x^{*} \cdot (x(\pi^{*}) - \underline{x}) + x(\pi^{*}) \cdot x(\pi^{*}) - \underline{x} \cdot \underline{x}$$

$$= ||x^{*} - x(\pi^{*})||^{2} - ||x^{*} - \underline{x}||^{2}.$$

(8) For all $i \in D$, $u_i(\underline{x}) < v_i(\pi^*)$. Quadratic utility implies mean-variance analysis. Letting v^* denote the variance of π^* , we have

$$v_{i}(\pi^{*}) - u_{i}(\underline{x}) = u_{i}(x(\pi^{*})) - v^{*} - u_{i}(\underline{x})$$

$$= -\|x^{i} - x(\pi^{*})\|^{2} + \|x^{i} - \underline{x}\|^{2} - v^{*}$$

$$\geq -\|x^{*} - x(\pi^{*})\|^{2} + \|x^{*} - \underline{x}\|^{2} - v^{*}$$

$$= u_{1}(x(\pi^{*})) - v^{*} - u_{1}(\underline{x})$$

$$= v_{1}(\pi^{*}) - u_{1}(\underline{x}) > 0,$$

where the first inequality follows from step 7 and the second from step 5.

(9) $\underline{x} \notin A^*$. Given step 8, weak dominance implies that $\underline{x} \notin A_i^*$ for all $i \in D$. Since $D \in \mathfrak{D}$ by step 6, and since \mathfrak{D} is proper and monotonic, we have $\{i \in N | \underline{x} \in A_i^*\} \notin \mathfrak{D}$.

Because \underline{x} is, by definition, proposed with positive probability, step 9 contradicts our assumption that σ^* is a no-delay equilibrium. Thus, we conclude that $\underline{x} = x^*$. (10) $S(\pi^*) = \{x^*\}$. This follows from $\underline{x} = x^*$ and uniqueness of individual 1's ideal point. Q.E.D.

Thus, under majority rule with n odd, quadratic utilities, and perfect patience, if the individuals' ideal points satisfy the "Plott conditions" (Plott 1967), then the majority rule core consists of a unique point, which coincides with the unique no-delay stationary equilibrium outcome of bargaining. Furthermore, by theorem 3, if we perturb the individuals' ideal points, then the equilibrium proposals stay near to one another as well as to their original position. Just this sort of continuity has been observed experimentally. Fiorina and Plott (1978) ran five-person, two-dimensional experiments in which utilities were such that the Plott conditions were sometimes satisfied and sometimes violated (and the core empty) but close to being satisfied. The experimental outcomes tended to cluster around the core in the former cases and did not stray very far in the latter.

The role of quadratic utility functions in theorem 6 is to allow us to use mean-variance analysis in the proof. To see that the theorem does not generalize to all utility functions based on Euclidean distance, consider one last example.

Example 7. Let n = 5, $X = [-1, 1]^2$, and $\rho_t = \frac{1}{5}$ for all $i \in N$, and assume ideal points x^i are at (1, 0), (0, 1), (-1, 0), (0, -1), and (0, 0). Rather than quadratic utilities, assume $u_t(x) = -\|x^t - x\|^4$ (ignoring the constant term), so (0, 0) is still the unique core point. Given the profile of proposal strategies in which all individuals propose their ideal points, the continuation values of the first four individuals are -5, and the continuation value of individuals 2 and 4 from the proposal $p_1 = (1, 0)$ is -4, which is greater than their continuation values, and accepting is a best response, so 1's proposal passes. A similar logic holds for the remaining proposals. Thus, we have a stationary equilibrium in which the core occurs only with probability one-fifth.

DISCUSSION

We have analyzed a noncooperative model of multiperson bargaining over a multidimensional alternative space. We have proved the existence of stationary equilibria and have related equilibrium outcomes to the core outcomes of the underlying voting rule. Our bargaining model replicates the predictions of the core under certain conditions but avoids the principle "negative" result of the social choice approach, namely, that the core is typically empty in multidimensional collective choice problems. Small perturbations of parameters that can lead the core suddenly to become empty will not affect the existence of stationary equilibria in our model. Furthermore, we establish a robustness property of equilibrium predictions that ensures the equilibrium outcomes of our model will respond to such perturbations in a continuous way, namely, that the set of outcomes does not "blow up" upon perturbation of parameters.

The model implicitly assumes that each individual's utility from the (unseen) "status quo" alternative is zero, and alternatives in X give the individuals nonnegative utility; equivalently, everyone weakly prefers all the alternatives in X to the status quo. If we drop this assumption, the proof of theorem 1 (i) no longer goes through, but we regain existence of equilibrium if we (1) explicitly specify the status quo, q, as an alternative in X; (2) impose the requirement that the discount rates of the individuals are identical, that is, there exists some $\delta \in [0, 1]$ such that, for all $i \in N$, $\delta_i = \delta$; and (3) define individual *i*'s payoff from outcome (x, t) as $(1 - \delta^{t-1})u_i(q) + \delta^{t-1}u_i(x)$. If we then assume $u_i(q) = 0$ for all $i \in N$ (now just a normalization), then individual i's payoff from outcome (x, t) would be defined just as before. As a special case, we obtain the model of Romer and Rosenthal (1978a, 1978b), where d = 1, majority rule, $\rho_i = 1$ for some $i \in N$ (the "agenda setter"), and $\delta_1 = \cdots = \delta_n = 0$. The core equivalence results are unaffected by the introduction of the status quo.

Once the status quo is explicitly brought into the model, an obvious but difficult extension would be to allow for bargaining to continue after passage of a proposal in period t, that proposal being the new status quo for period t + 1, and so on. Baron (1996) characterizes the stationary equilibria of such a model when the set of alternatives is one dimensional, and Baron and Herron (1998) investigate a finite-horizon version of the model with three individuals, twodimensional policy space, and quadratic utility functions. With the addition of this state variable, stationary strategies must be conditional on the status quo: Proposal strategies would be mappings from X (possible status quo outcomes) to probability measures on X, and acceptance strategies would be correspondences from X to X. It may be possible to modify the techniques of this article to the analysis of this complex but realistic setting, but that is a matter for future research.

We have taken recognition probabilities as exogenously given, without offering an explanation of their possible origins. One interpretation, appropriate when bargaining takes place within a parliamentary or legislative body, is that the individuals represent parties and that the recognition probability of a party represents the number of seats it holds, proxying for the party's influence in lawmaking. An interesting extension would

be to model explicitly the voters who elect the members of parliament, providing an alternative to Austen-Smith and Banks (1988), Coate (1997), Schofield (1998), Schofield and Sened (1998), and Baron and Diermeier (1998).

While we have investigated a model of bargaining, other types of institutional structures have been modeled noncooperatively to obtain equilibrium existence in the absence of core outcomes. These approaches include sophisticated voting under various types of agendas (Banks 1985; Farquharson 1969; McKelvey and Niemi 1978; Miller 1977, 1980; Shepsle and Weingast 1984); mixed strategy equilibria in two-party spatial competition games (Banks, Duggan, and Le Breton 1998; Kramer 1978; Laffond, Laslier, and Le Breton 1993; Laslier and Picard 1998; McKelvey 1986); and the "structure-induced equilibrium" model of committees (Denzau and Mackay 1981; Shepsle 1979), in which each committee is assigned to a dimension of the alternative space and is given sole jurisdiction over the location of the policy along that dimension. In contrast to the latter approach, our bargaining model may be viewed as a model of legislatures in the absence of a formal committee system, as one that provides a useful benchmark against which a general model of institutional choice can be constructed, and as one that offers a prediction in situations in which no such institutional arrangements are to be found. An important question is then the extent to which our model gives different predictions for the same underlying preferences and how well these predictions square with empirical observations.

An alternative within the cooperative paradigm is to consider solutions other than the core. Numerous alternative solution concepts have been suggested, such as the von Neumann-Morgenstern solution (von Neumann and Morgenstern 1944), the Nash bargaining solution (Nash 1950), the bargaining set (Aumann and Maschler 1964), the competitive solution (McKelvey, Ordeshook, and Winer 1978), the uncovered set (Banks, Duggan, and Le Breton 1999; Cox 1987; McKelvey 1986; Miller 1980), and the heart (Schofield 1996, 1998). A question we have not addressed here is the relationship between the equilibrium outcomes of our noncooperative bargaining model and the above solutions, but our core equivalence results do inform us that assuming unanimity rule and setting discount rates equal to one in our model does not yield the Nash bargaining solution (or any other selection from the Pareto optimals): By lemma 1, every Pareto-optimal alternative could be supported as a stationary equilibrium outcome for this specification of the model. It may be that, as in Binmore's (1987) model of two-person bargaining, equilibrium outcomes do converge to the Nash solution as discount rates increase to one, which would give us a robust selection from the limit equilibrium outcomes.

APPENDIX

As discussed preceeding theorem 3, let $\rho=(\rho_1,\ldots,\rho_n)\in\Delta$ and $\delta=(\delta_1,\ldots,\delta_n)\in[0,1]^n$ be the profiles of

It need no longer be the case that $u_i(x(\pi)) \geq \delta_i v_i(\pi)$, so that $x(\pi)$ need not be an element of $A_i(\pi)$, which invalidates our argument that $A_C(\pi)$ is nonempty. When all individuals have discount rate δ_i , however, concavity of u_i yields $(1-\delta)q + \delta x(\pi) \in A_i(\pi)$ for all $i \in N$.

individuals' recognition probabilities and discount rates. Index profiles of utility functions by $\lambda \in \Lambda \subseteq \Re^k$, and assume each $u_i(\cdot, \lambda)$ is concave and nonnegative. Moreover, assume there is some $x \in X$ such that, for all $j \in N$, $u_j(x, \lambda) > 0$. Also assume each u_i is jointly continuous. Let $\Theta = \Delta \times [0, 1]^n \times \Lambda \times [\mathcal{P}(X)]^n$, let $\theta = (\rho, \delta, \lambda, \pi)$ as in the proof of theorem 3, and define

$$r_i(\theta) = \delta_i v_i(\pi, \rho, \lambda),$$

where v_i is defined as above but using $u_i(\cdot, \lambda)$. Define the correspondence $A_i:\Theta\longrightarrow X$ by

$$A_i(\theta) = \{x \in X | u_i(x, \lambda) \ge r_i(\theta)\},\$$

and let $A_C(\theta) = \bigcap_{i \in C} A_i(\theta)$ and $A(\theta) = \bigcup_{C \in \mathfrak{D}} A_C(\theta)$. We can now state the main result of this section.

THEOREM 7. A has nonempty, compact values. If $\delta_i < 1$ for all $i \in N$ at θ , or if LSWP holds at θ , then A is continuous at θ.

Proof: The proof proceeds in a series of steps.

(1) A_C has nonempty values. By concavity and nonnegativity of $u_i(\cdot, \lambda)$ and $\delta_i \leq 1$, it follows that $u_i(x(\pi), \lambda) \geq$ $r_i(\theta)$; therefore, $x(\pi) \in A_C(\theta)$.

(2) A_C is compact-valued. This follows from the continuity of $u_1(\cdot, \lambda)$, the compactness of X, and the fact that compactness of the $A_i(\theta)$ sets is preserved by intersections.

- (3) A_i is upper hemicontinuous. Take any θ and any open $V \subset X$ such that $A_{i}(\theta) \subseteq V$. Suppose there is a sequence $\{\theta_m\}$ converging to θ such that, for all $m, A_i(\theta_m) \setminus V \neq \emptyset$. For all m, let $x_m \in A_i(\theta_m) \setminus V$; then $\{x_m\}$ lies in $X \cap V$, which is compact since V is open and X is compact. Thus, without loss of generality we can assume $\{x_m\}$ converges to some $x \in$ $X \cap V^{c}$. Since $u_{i} - r_{i}$ is jointly continuous (see Billingsley 1968, Theorem 5.5), $(\theta_m, x_m) \to (\theta, x)$ implies $[u_i(x_m, \lambda_m) - r_i(\theta_m)] \to [u_i(x, \lambda) - r_i(\theta)]$. Then $x_m \in A_i(\theta_m)$ implies $u_i(x_m, \lambda_m) - r_i(\theta_m) \ge 0$ for all m, so $u_i(x, \lambda) - r_i(\theta_m) \ge 0$. $r_i(\theta) \geq 0$. But then $x \in A_i(\theta) \subseteq V$, which contradicts the assumption that $x \in \mathcal{V}^c$.
- (4) A_C is upper hemicontinuous. Upper hemicontinuity follows from theorem 14.24 in Aliprantis and Border (1994), which states that the intersection of compact-valued, upper hemicontinuous correspondences is upper hemicontinuous.

Now define the correspondence $A_i^x:\Theta\longrightarrow X$ by

$$A_i^s(\theta) = \{x \in X | u_i(x, \lambda) - r_i(\theta) > 0\},$$

- and let $A_{c}^{r}(\theta) = \bigcap_{i \in C} A_{i}^{r}(\theta)$.

 (5) A_{i}^{r} has open graph. Take $(\theta, y) \in GrA_{i}^{r}$, that is, $u_{i}(y, y) \in GrA_{i}^{r}$, that is, $u_{i}(y, y) \in GrA_{i}^{r}$, that is, $u_{i}(y, y) \in GrA_{i}^{r}$. $(\lambda) - r_i(\theta) > 0$. Since $u - r_i$ is continuous on $\Theta \times X$, there exists an open set $V \subseteq \Theta \times X$ such that $(\theta, y) \in V$ and $u_i(y', y') \in V$ λ') $-r_i(\theta') > 0$ for all $(\theta', y') \in V$, which implies GrA_i^* is open.
- (6) A_C^s has open graph. This follows from step 5, since the finite intersection of open sets is open.
- (7) If $\delta_i < 1$ for all $i \in N$, then $A_C^*(\theta) \neq \emptyset$. Let $x \in X$ be such that $u_i(x, \lambda) > 0$ for all $i \in N$. If $r_i(\theta) = 0$, then, since $u_i(\cdot, \lambda)$ is concave and nonnegative, $u_i(\alpha x + (1 - \alpha)x(\pi))$, $\lambda > 0 = r_i(\theta)$ for all $\alpha \in (0, 1)$. If $r_i(\theta) > 0$, then, since $u_i(\theta) > 0$, λ) is concave and nonnegative and since $\delta_i < 1$, $u_i(x(\pi))$, $(\lambda) > \delta_i \nu_i(\pi, \lambda) = r_i(\theta)$. Thus, by continuity, $u_i(\alpha x + (1 - \epsilon))$ $\alpha(x(\pi), \lambda) > r(\theta)$ for $\alpha > 0$ low enough. Taking $\alpha > 0$ low enough, therefore, $\alpha(x) + (1 - \alpha)x(\pi) \in A_C^{\bullet}(\theta)$.
- (8) If $\delta_i < 1$ for all $i \in N$, then A_C is lower hemicontinuous at θ . Take any $x \in A_C(\theta)$; from step 7 there exists $y \in A_C(\theta)$; by concavity of the $u_1(\cdot, \lambda)$, $1/m y + (1 - 1/m)x \in$ $A_C(\theta)$ for all nonnegative integers m. Letting m go to infinity, we have $x \in A_C(\theta)$. With step 6 it follows that, at θ , A_C differs from an open subcorrespondence only at points of

closure. Therefore, following lemma 14.21 in Aliprantis and Border (1994), A_C is lower hemicontinuous at θ .

(9) If LSWP holds at θ , then either $|A_C(\theta)| = 1$ or $A_C(\theta)$ $\subseteq A_C^*(\theta)$. Suppose $|A_C(\theta)| > 1$, take any $x \in A_C(\theta)$, and note that, as in step 1, $x(\pi) \in A_i(\theta)$ for all $i \in C$. Partition C into two sets:

$$I = \{i \in C | u_i(x(\pi), \lambda) = r_i(\theta)\},\$$

$$J = \{i \in C | u_i(x(\pi), \lambda) > r_i(\theta)\}.$$

Note that, for all $i \in J$, $x(\pi) \in A_i^*(\theta)$, an open set. Thus, we can find an open set V such that $x(\pi) \in V \subseteq A_I^{\mathfrak{p}}(\theta)$. Note also that

$$|R_I(x(\pi))| = |A_I(\theta)| \ge |A_C(\theta)| > 1,$$

so, by LSWP, there is a sequence $\{x_k\}$ in $P_I(x(\pi))$ converging to $x(\pi)$. Picking k high enough, therefore, we have

$$x_k \in V \cap P_I(x(\pi)) \subseteq P_C(x(\pi)) \subseteq A_C^s(\theta).$$

By concavity, $1/m x_k + (1 - 1/m)x \in A_C^{\sigma}(\theta)$ for all nonnegative integers m. Letting m go to infinity, we have $x \in$ $A_C(\theta)$.

(10) If LSWP holds at θ , then A_C is lower hemicontinuous at θ . From step 9 there are two cases to consider. If $|A_C(\theta)|$ $= \{x'\}$ for some $x' \in X$, then, for every open set $V \subseteq X$, V $\cap \{x'\} \neq \emptyset$ implies $\{x'\} \subseteq V$, in which case lower hemicontinuity at $\hat{\theta}$ follows from steps 1 and 4. If $A_C(\theta) \subseteq$

 $A_C^{\bullet}(\theta)$, then, as in step 8, A_C is lower hemicontinuous at θ . We can now complete the proof. That A has nonempty, compact values follows from steps 1 and 2 and the arbitrary choice of C. If $\delta_i < 1$ for all $i \in N$, then continuity of A_C at θ follows from steps 4 and 8; continuity of A at θ then follows from theorem 14.26 in Aliprantis and Border (1994), which states that the finite union of continuous correspondences is continuous. If LSWP holds at θ , continuity of A_C at θ follows from steps 4 and 10, and continuity of A at θ again follows.

The Supreme Court and Local Public Opinion

VALERIE J. HOEKSTRA Washington University in St. Louis

ost research suggests that the mass public knows very little about the Supreme Court and, consequently, that decisions do not affect attitudes toward the Court. I argue that where there is sufficient access to information about Court cases and when the issues are perceived as important, people pay attention and use this information in their evaluation of the Court. The research is based on a series of two-wave panel studies that examine the effect of Supreme Court cases in the local communities where the controversies began. The results show that a substantial number of residents heard about the Court's decision and subsequently changed their evaluation of the Supreme Court, especially those who live in the immediate community. The results suggest that we need to consider other circumstances in which people hear about and care about Supreme Court decisions.

Research on the relationship between specific Supreme Court decisions and public support for the Court has been frustrated by the apparent public ignorance of all but the most controversial and visible cases (see Caldeira 1991). In the standard account, citizens are portrayed as quite willing to offer an opinion about the institution, but they do so without knowledge of many individual decisions. Thus, many scholars conclude that support for the Court rests upon more enduring attitudes about the legitimacy of the Court in the system of government rather than on agreement or disagreement with specific decisions.

Although most research suggests that the majority of Court decisions go unnoticed, the possibility that these decisions influence attitudes toward the institution is not without some support in the literature. The connection has been established in experimental research (Mondak 1991, 1992; Segal 1995) but has not been very well documented outside the laboratory. The reason is straightforward: If Court decisions are not common knowledge, by definition they can have no effect. One major obstacle is that most national surveys do a poor job of identifying conditions in which people are motivated to learn about specific Court decisions and in which they have sufficient access to information about them (but see Franklin and Kosaki 1995; Franklin, Kosaki, and Kritzer 1993; Hoekstra and Segal 1996). Consequently, we may be underestimating the importance of citizens' reactions as an element of support for the Court. One instance in which interest and access to information are likely to be high is the local communities where a controversy began. People should be more interested in cases that involve members of their own community than in cases that involve individuals or groups from somewhere else (Boninger, Berent, and

Valerie J. Hockstra is Assistant Professor of Political Science, Washington University in St. Louis, St. Louis, MO 63130-4899.

Funding for this research was provided by a grant from the National Science Foundation (SBR 9423032). An earlier version of this paper was presented at the 1996 annual Conference on the Scientific Study of Judicial Politics. I am grateful to Jeffrey A. Segal for invaluable assistance and guidance on this project and to Kathleen McGraw, Stanley Feldman, Lee Epstein, Charles Franklin, and the members of the SUNY Stony Brook Political Psychology Seminar Series for their suggestions and comments at various stages of this project. Fmally, I would like to thank the anonymous referees for their recommendations. Analysis conducted using SPSS and SAS.

Krosnick 1995; Krosnick, Boninger, and Chuang 1993). Also, since the local media tend to report on issues of local concern (Graber 1997), residents of the community should have the opportunity to hear about these decisions.

I describe the results of a series of two-wave panel studies designed to assess individual awareness of Court decisions, individual interest in those decisions, and the effect of those decisions on individual attitudes toward the Court. I focus on four Supreme Court cases and the attitudes of citizens in the communities where the controversies began. The results should be generalizable to other communities in which there is an interest in an issue and access to information about a relevant case. Religious groups, for example, are likely to follow cases that concern religious freedom or abortion (see Franklin and Kosaki 1989), as are police officers regarding criminal procedure cases (see Berkson 1978). The ability to generalize is also justified by recent research that shows national levels of awareness are higher than previously recognized (Franklin and Kosaki 1995; Franklin, Kosaki, and Kritzer 1993).

SUPPORT FOR THE SUPREME COURT

Most accounts of public support for the Supreme Court refer to the Court's legitimacy as an institution of government. Explanations for the source of this legitimacy are diverse. Early research emphasized that the Court benefits from socialization that leads citizens to perceive it is a wise and benevolent institution and as the last bastion of constitutional freedoms (Adamany and Grossman 1973; Casey 1974; Easton 1965; Easton and Dennis 1969; Jaros and Roper 1980). More recent research focuses on whether support comes from relatively enduring attitudes (i.e., diffuse support) or stems from evaluations of actions taken by the Court (i.e., specific support) (Caldeira 1986; Caldeira and Gibson 1992; see also Jaros and Roper 1980; Murphy and Tanenhaus 1968; Tanenhaus and Murphy 1981). Sim-

¹ Caldeira and Gibson (1992) have a focus different from mine. Primarily, their aim was to disentangle two different types of support for the Court (specific and diffuse) that have been poorly measured in previous research. Nevertheless, their finding of the relative absence of specific information in long-term evaluations of the Court

ilar to the notion of the issue voter in electoral research, specific support refers to a "set of attitudes toward an object based upon the fulfillment of demands for particular policies or actions" (Caldeira 1986, 322). In contrast, similar to the voter who relies on party cues, diffuse support refers to "generalized and firm attachments" or a "reservoir of favorable attitudes" (p. 322). Diffuse support is more enduring and lacks much connection between outcomes and attitudes.

The prevailing consensus is that support for the Court is more diffuse than specific, especially among the mass public (Caldeira and Gibson 1992; Mondak 1992). Yet, the research does not entirely preclude the effect of decisions. Rather, there is assumed to be some dynamic component to the process, such that especially notable or activist decisions may factor into the equation. According to Caldeira and Gibson (1992, 652), "to the extent that the Supreme Court openly embraces judicial activism, the citizenry may judge the institution in the same light as other political institutions: policy agreement and disagreement will significantly affect support for the institution." Mondak and Smithey (1997) echo this idea. They present a primarily theoretical dynamic model of support for the Court and suggest that individual attitudes generally tend to be positive, but they may change as a result of controversial and unpopular decisions.

Finally, others argue that Court procedures—such as the secrecy of deliberations, infrequent media attention, and perceptions of being removed from partisan political battles both within the Court and between the Court and other branches of government—lend it greater support in the public eye (Hibbing and Theiss-Morse 1995). Indeed, aggregate levels of support for the Court are consistently higher than for Congress and the executive branch, and they appear to be relatively more stable as well (Hibbing and Theiss-Morse 1995; Marshall 1989; Mondak and Smithey 1997). Although the data on aggregate public support for the Court are consistent with this process argument, they also may very well be consistent with citizens hearing about certain cases and changing their perception of the Court in response. As Mondak and Smithey (1997, 1139) note, "individual level change does not necessarily preclude aggregate level stability." The evidence in support of the process argument is based largely on aggregate measures of support for the Court, with little attention paid to variation at the individual level.

KNOWLEDGE OF SUPREME COURT DECISIONS

The conclusion that the public is uninformed and uninterested in Court activities is usually drawn from

among the mass public is relevant to this research. The way they measure support for the Court also differs from my method. I am interested in how specific decisions affect individuals' attitudes, whereas Caldeira and Gibson are more interested in measuring commitment to the very institution, which theoretically should be completely separate from its decisions.

national public opinion surveys, typically of the voting behavior of the American electorate. These surveys may be well suited to the examination of voting behavior, but they usually lack data appropriate for the study of the Supreme Court and its activities. Even when good measures are found, they are rarely repeated, the questions often do not adequately reflect the subtlety of the issues involved in the cases, the time lags between surveys and decisions vary considerably, and they are usually conducted around the timing of elections rather than the Court's calendar (Caldeira 1991). Finally, these studies rarely do very much to identify cases about which we can reasonably expect citizens to hear. Recent research by Franklin and his colleagues demonstrates this point. Their data, collected with the Court's calendar in mind, reveal more widespread awareness of Court decisions than commonly thought (Franklin and Kosaki 1995; Franklin, Kosaki, Kritzer 1993).

In short, experimental research holds the door open on the question, but there has been little evidence to document the Court's effect on public opinion outside the laboratory environment (Mondak 1991, 1992; Segal 1995). The main obstacle appears to be the lack of appropriate data to test this relationship and the inability to identify conditions in which individuals have much knowledge of specific Court decisions. With these ideas in mind, I turn to my hypotheses about the effect of Supreme Court decisions in and around the local communities in which cases originated.

HYPOTHESES

Awareness and Perceptions of Importance

Local media are likely to report on cases ultimately decided by the Supreme Court. These cases are newsworthy because they involve local officials, groups, individuals, and issues that may have been in dispute for some time. The consensus of psychological and political science research on political attitudes is that the more important an issue is to an individual, the greater is the motivation to pay attention to and spend time thinking about the issue and its political implications (Fiske and Taylor 1992; Krosnick, Boninger, Chuang 1993; Petty and Cacioppo 1986). The perceived importance need not come from some actual material interest being jeopardized. In fact, social psychologists emphasize the subjective sense of importance (see Boninger, Krosnick, and Berent 1995). Other sources of importance can include such considerations as identifying with the people involved (e.g., members or groups in the local community) (Boninger, Krosnick and Berent 1995). Although people in both the immediate and surrounding communities in which controversies originate should have roughly equal access to information about the Court, those from the immediate vicinity should find the case especially compelling because they identify with and recognize the groups involved. This leads to my first hypotheses:

Awareness

Hypothesis 1a. Residents in and around the immediate community in which a case originates should exhibit a higher level of awareness of the Court's decision than is usually found in national samples.

HYPOTHESIS 1b. Those within the immediate community should show a higher level of awareness than those who reside in the surrounding areas.

Importance

HYPOTHESIS 2. Among those who hear of the Court's decision, those from the immediate community should find the case more important than those from the surrounding areas.

Evaluation of the Court

If Court activities do not affect how people feel about the Court, evaluations should change according to how the individual initially feels about an issue. This leads to my third hypothesis.

HYPOTHESIS 3. Awareness of the Court's decision should affect evaluations of the Supreme Court. Those who initially approve/disapprove of the policy position articulated in the decision should show increased/decreased support for the Court.

Finally, since those in the immediate community are expected to rate the issue as more important, I expect that they will attach greater weight to the information than those from the surrounding areas. This leads to my final hypothesis.

HYPOTHESIS 4. The effect of hearing about the Court's decision should be greatest among those who reside in the immediate community. They will show greater change in evaluation of the Court following its decision, above and beyond that predicted for those who reside outside the community.

CASES

To test these hypotheses, I use four recent Supreme Court decisions: Two cases involve civil liberties claims, and two are economic/regulation cases. Lamb's Chapel v. Center Moriches Union Free School District (1993) (hereafter the Center Moriches case), involves First Amendment free speech, free exercise of religion, and religious establishment issues. The New York state legislature provided school districts with a list of the types of organizations that could use school facilities after hours. The list included social, civic, recreational,

and political groups but specifically prohibited religious groups from using school facilities for religious purposes. The school district in Center Moriches, New York, allowed many local groups access to facilities after hours, but in 1988 a nondenominational evangelical church, Lamb's Chapel, asked to use the high school auditorium to show a six-part film, "Turn Your Heart Toward Home." It featured a psychologist discussing parenting and family issues from a religious point of view. The school district twice denied the church's request. After two lower courts rejected the church's claims, Lamb's Chapel appealed to the Supreme Court, which agreed to hear the case. Oral arguments were presented in February 1993, and the Court unanimously decided in favor of the church on June 7, 1993. The decision asserted that the law, and the school district's refusal, violated the free exercise and free speech rights of the church. Any establishment of religion claims put forth by the school district were not strong enough to justify infringement of the rights of the church.

The second case also revolves around religion and the First Amendment (hereafter the Monroe case, the city where the controversy began). At issue in Board of Education of Kiryas Joel v. Grumet (1994) was whether the creation of a special school district for a Hasidic Jewish community by the New York legislature violated the religious establishment clause of the First Amendment. The Hasidic Jews in Monroe educate the majority of their children in private schools that they pay for and run, but a number of the children need special education. The Hasidim could not provide that service but opposed using the public school programs, fearing that their children would be traumatized by interactions with outsiders. In 1989 the legislature created a special school district for the community, paid for by the state. The boundaries were drawn to include the entire Hasidic community and excluded all others. Before the district opened, a suit was filed in state court arguing that creation of the district impermissibly advanced a particular religious interest. The trial court issued a summary judgment against the operation of the school district (601 NYS 2061). The Supreme Court heard the case and issued its decision in 1994. It ruled that the creation of the school district violated the establishment clause of the First Amendment. Since no other religious group in New York could expect similar treatment, the state was impermissibly favoring the Hasidic community.

The third case, Oklahoma Tax Commission v. Chickasaw Nation (1995) (hereafter the Oklahoma case) involved state taxes on gasoline sold by Native Americans on tribal land.³ The Supreme Court, in its decision on June 14, 1995, ruled against the taxation because the U.S. government has exclusive control over relations with Native Americans. Since Congress has not enacted such taxation, Oklahoma had overstepped its authority, according to the Court.

² I present the results for four of five studies that were done. The fifth was conducted in the Columbus, Ohio, area and is not presented because the Court decision was handed down the day of the Oklahoma City bombing. The event swamped news coverage, and only about 5% of the respondents in the Ohio samples had heard of the Supreme Court decision. Among the very few individuals who had heard about the decision (nine people), however, the results are completely consistent with the other samples. There are simply too few observations to place much confidence in them.

Reservations per se do not exist in Oklahoma. Instead, Native Americans own land privately, but that land is subject to the same relationship with state and federal government as are reservations.

The fourth case, Babbitt, Secretary of the Interior, et al. v. Sweet Home Chapter of Communities for a Greater Oregon (1995) (hereafter the Oregon case), involved the 1973 Endangered Species Act. At issue was whether the act, which protects endangered species from harm, should similarly apply to the habitat of endangered species. That was Babbitt's position, but business interests in Oregon challenged his interpretation. They argued that the broad interpretation of the legislation placed an unfair burden on private property and businesses by regulating what owners could and could not do with their own property. The Supreme Court agreed with Babbitt, stating that it was logical to protect the habitat as well.

These four cases are rather typical of those the Court routinely decides. None are of the sort to garner the controversy or publicity of cases such as *Roe* v. *Wade* (1973). Although these cases were not chosen randomly, they are fairly representative of the Court's docket each year.⁴

DATA AND METHODS

The data for this project come from four quasi-experimental studies that examine attitudes toward the Court before and after the announcement of the decisions. For each survey, I generated two random samples: one from the immediate community, and one from the surrounding area. The boundaries for the latter were drawn to reflect the coverage of the dominant local newspaper (see Appendix A). I expect the former to perceive the case as more important than the latter. In addition, I drew two additional samples for the Oklahoma and Oregon cases to participate only in the second wave. These were similarly drawn according to town of residence. I used these additional samples to assess whether participation in the first wave had an effect on interest in the cases. The first wave was conducted following oral arguments and before the Court handed down its decision. The second wave took place during the two weeks after the decision.

RESULTS

Hypothesis 1a predicts a relatively high level of local awareness of Court decisions compared to levels typically reported in national samples. To determine awareness, I used an uncued recall question (see Appendix B). Table 1 shows that in two studies awareness was quite high for both the immediate and the surrounding communities. In Center Moriches, 85.1% of the immediate sample and 78.3% of the surrounding sample knew about the decision. In Monroe, the respective figures were 74.1% and 68.6%. In the Oklahoma and Oregon studies, levels in the immediate community were more moderate (39.0% and 47.3%) and in the surrounding areas were somewhat lower, especially in Oklahoma (10.7% and 33.3%, respectively). I also include a pooled estimate of awareness level

TABLE 1. Aggregate Level of Awareness of Supreme Court Decisions

	Immediate Community	Surrounding Area	
Center Moriches N	85.1% (67)	78.3% (46)	
Monroe	74.1%	68.6%	
N	(54)	(70)	
Oklahoma ^a	39.0%	10.7%	
N	(41)	(75)	
Oklahoma (second-wave only) N	, 35.0% (20)	13.6% (22)	
Oregon ^a	47.3%	33.3%	
N	(74)	(72)	
Oregon (second-wave only) N	56.3% (16)	42.9% (14)	
Pooled ^a	62.7%	44.1%	
N	(236)	(263)	

Note: In parentheses is the number of respondents successfully contacted who agreed to perticipate in the second wave. The difference between the immediate communities and the surrounding area is significant at $\rho<0.6$

across the four studies.⁵ Not surprisingly, it shows that those in the immediate community were more likely to hear about the decision than those in the surrounding areas.⁶

How do these results compare with national levels of awareness? I do not have national data for these four cases, but I can compare my results with those from similar cases for which national surveys exist. The best comparable data were collected by Franklin, Kosaki, and Kritzer (1993), who assess national awareness of six cases from the Court's 1992 term. This information is presented in Table 2, along with relevant media information for all cases. Franklin, Kosaki, and Kritzer (1993) examine awareness for cases involving sexual harassment (Franklin v. Gwinnett County Public Schools), sales tax (Quill Corp. v. North Dakota), hate speech (R.A.V. v. City of St. Paul), tobacco company liability (Cipollone v. Liggett Group), school prayer (Lee v. Weisman), and abortion (Planned Parenthood of Southeastern Pa. v. Casey). As Table 2 shows, national

⁴ I discuss this issue of the representativeness of these cases in greater detail below, in the section on media coverage.

⁵ I also conducted subsequent analysis pooling the data, and the results lend support to the hypothesis. I do not present those results for two reasons. First, the expectations are the same for each study, but analysis revealed some differences across the studies. Second, these samples are drawn from different populations, which makes pooling the data inappropriate. I present the pooled analysis on awareness in Table 1 simply to summarize the findings.

⁶ In Table 1 I also include reports from those who participated only in the second wave for the Oklahoma and Oregon studies. The results show they were about as aware, or even more aware, of Court decisions as participants in first-wave studies. Therefore, it is unlikely that participation in the first wave artificially increased attention to the Court's activities.

Note: Data on newspaper coverage for Franklin, Kosak, and Kritzer cases obtained from Online Resources (http://www.onliners.com), a fee-based newspaper archive. Data for local media coverage of my case come from the research/archive office of the newspaper and/or Academic Universe (http://exde-nexts.com/universe). Data on television news coverage come from Vanderbitt Television News archives (http://tvnews.vanderbitt.edu/).
*On the evening news the day of the decision only.

^olinoludes one story in the Sunday magazine.

The Oregon decision was handed down the same day as a congressional redistricting case and a religion case. All three were reported together on all three networks as the lead story. On all three networks the Oregon case was reported following the other two.

"The percentage aware probably overestimates the level ence it is the high point of awareness in the Franklin, Kosaki, and Kritzer study. The percentage that I present is total awareness during the entire two-week period. In sum, the companion between my study and that of Franklin, Kosaki, and Kritzer is conservative.

The tobacco and school prayer decisions were handed down the same day. The Vanderbitt transcripts of the coverage of these two cases on CBS listed them under one subheading. That listing stated that the combined coverage lasted four minutes, ten seconds. I divided that in half, allotting to each two minutes, five seconds (125 seconds each).

awareness ranges from a low of virtually none (the sexual harassment case) to a high of 40% (the abortion case).⁷

In both the immediate and surrounding communities, awareness in Center Moriches and Monroe exceeded the national level in the most similar cases in the Franklin, Kosaki, and Kritzer study. In fact, in those two cases, local awareness even surpassed national awareness of the abortion decision. The same is true for the immediate community in the Oregon case, although awareness of the abortion decision was higher in the surrounding areas. Even in the Oklahoma case, which received virtually no attention in the national media, immediate community awareness was similar to the Franklin, Kosaki, and Kritzer figures for abortion,

although national abortion awareness was markedly higher than awareness in the surrounding areas. The reasons for generally high awareness of the local issue is simple: The local papers provide access to information that is not widely available elsewhere in the nation. This is supported by the data on local media coverage of the cases studied by Franklin, Kosaki, and Kritzer (1993). In four of the five cases for which local media coverage was available, greater attention was paid to those cases than in the national media.⁸

As hypothesis 1b suggests, however, exposure to information is only part of the picture. Those who reside in the immediate community should show

^bincludes editorials.

⁷ I report the highest level of swareness in their national samples. Their study also reports awareness for each day following the Court's decision. There is a definite peak at the time of the decision and then gradual decline. The measure I report for my studies is total awareness over the entire sampling period, regardless of the amount of time lapsed between the decision and the survey. This provides for a conservative comparison between their study and mine. The abortion decision is abit of an outlier in terms of media attention. It appears in 17 New York Times articles, and the three networks made it the lead story on the evening news broadcast, devoting a combined 1,530 seconds to it. The sexual harassment decision is also somewhat of an outlier. It received moderate attention in the national media, yet it did not register with the national public at all.

Since my cases and two of the Franklin, Kosaki, and Kritzer (1993) cases specifically mention the city or school board in the name of the case, I made one other media comparison for the sake of caution. I took a random sample from the Court's 1996–97 term and examined local and national media attention for those cases (see Appendix C). Although I do not have data on awareness level for those cases, the findings for media coverage of them support my findings regarding local media coverage. Approximately half the cases received greater local than national media attention. For those cases with local media coverage equal to or less extensive than national attention (i.e., New York Times), there was even less, if any, coverage elsewhere in the nation. In other words, cases were covered by the local media, and often the New York Times, but not the local media m other parts of the country. This supports the claim that the local media are important in disseminating information about the Supreme Court.

greater interest in and motivation to seek out information than those in the surrounding area, even though the information available is roughly equal.9 In other words, there should be differences within each of the studies. The aggregate measures in Table 1 support this possibility, but it is impossible to determine whether there are significant differences at the individual level between the geographic samples without controlling for factors that tend to increase general political knowledge, such as attention to media, the frequency of engaging in political discussions, level of education, and gender. Each has been shown to increase attention to politics in general and to Supreme Court decisions in particular (Franklin and Kosaki 1995). In addition, Franklin and Kosaki suggest that case-specific factors such as religion and race may positively affect awareness of cases that deal with those issues. For example, Catholics should pay more attention to abortion decisions, and African Americans should pay more attention to discrimination cases. Similarly, those from the immediate community in which the controversy began should be more inclined to seek out information about that case, regardless of the substantive topic.

To test for the effect of geographic location on attention to Court cases, I looked at the effect of town of residence while controlling for factors previously shown to influence awareness of Court decisions. The dependent variable is simply whether the respondent knew how the Court had decided (following the filter question that asked whether they had heard anything about the issue recently). It is a dichotomous variable; 1 indicates that they knew the decision, 0 otherwise. Because the dependent variable is dichotomous, I analyzed the relationship using logistic regression. The independent variables were attention to media and politics, education, gender, and the variable most important to this research, town of residence (see Appendix B). Attention to politics and media was measured by the number of days in the last week that the respondent had (1) watched the news on television (Television Viewing), (2) read the news in a daily paper Newspaper Reading), and/or (3) discussed politics (Political Discussion). Education was measured on a fivepoint scale that ranged from 1 (less than high school) to 5 (postgraduate education). Gender was measured as male (1) or female (0). Town of Residence was coded 1 for those who reside in the immediate community, 0 for those who reside in the surrounding areas. Based on previous research, I expect each variable to be positively related to the probability of having heard about

The results are presented in Table 3. In two of the

four studies, living in the immediate community significantly increased the probability of hearing about the Court's decision. Only in Center Moriches and Monroe, where there were very high levels of awareness and little aggregate variation between the local community and surrounding areas, did town of residence prove statistically insignificant. In both cases it is in the correct direction, however. As expected, gender, education, and the frequency of newspaper reading and political discussion are also important explanations of individual levels of awareness of the decision.¹⁰

To understand better the substantive effect of town of residence along with the other independent variables, I calculated a series of predicted probabilities and present the results in Table 4. The probabilities are arranged for various levels of education, attention to media (newspaper and television), and the frequency of engaging in political discussions. The analysis was conducted separately for those from the immediate and surrounding communities. Overall, the probability of hearing about the Court's decision increases with education and attention to politics. More important for the purposes of this study, in each survey those from the immediate community are predicted to be more likely to hear about the decision than those from the surrounding areas.

The data in tables 3 and 4 are consistent with what we know about the effect of education, gender, and engagement in politics on levels of political knowledge. What is more important, the data reveal how one measure of interest, geographic proximity to the origins of a controversy, can increase attention to and interest in a specific Supreme Court case even after controlling for these other variables.

Perceived Importance of the Issue

Hypothesis 2 predicts that those who hear about the decision and reside in the immediate community will find the issue more important than those who reside in the surrounding areas. I used four measures of importance in both waves of the survey: (1) how strongly the individual felt about the issue (Strength of Opinion), (2) how much time s/he spent thinking about the issue (Time Thinking), (3) how important the issue was personally (Personally Important), and (4) how important it was to the community (Important to Community). Each variable was measured on a three-point scale (1 = not very strongly/often/important; 3 = verystrongly/often/important). The Center Moriches study included only a single measure of importance (strength of opinion). I also report a summary measure (Summary), which simply adds the responses to four items. It ranges from 0 to 12. Since I am most concerned with respondents' perceptions of the importance of the issue after hearing the Court's decision, I present the importance ratings from the second wave, shown in Table 5.

⁹ My samples were designed to reflect the coverage of the dominant newspaper in the region, but smaller newspapers operate in some of the towns. For example, in the Oklahoma study, some of the residents in Ada (the immediate community) reported reading about the decision in the Ada Evening News, but most of the respondents there and in the surrounding areas reported the source as the local television news, followed closely by the radio The main newspaper for both groups in the Oregon sample is the Oregonian, but some respondents in both groups read about the decision in the Albany Democrat Herald; the most common source for both groups was television news.

¹⁰ Although I do not present the pooled model for reasons described earlier, the results from pooled analysis show that each variable, except the frequency of television viewing, is positively and significantly related to the probability of hearing about the decision.

"The frequency of newspaper reading, television viewing, and political discussions were obtained in the second wave.

In each study, there is some evidence that the members of the geographic communities rate the importance of the issues differently. In the Center Moriches study, which measured only strength of opinion, the differences between the communities are not what hypothesis 2 predicts. Residents in surrounding areas felt more strongly about the issue than did residents of

the immediate community. This may be due to the fact that only a single measure was used, and it fared poorly in the Monroe and Oregon studies, too. In the remaining three studies the evidence is generally as expected. Those from the immediate community rated the issue more important than did those in the surrounding areas. The item assessing perception of the importance

to the community and the summary measure provide the strongest and most consistent support for hypothesis 2.11

In short, there is moderately strong evidence to support hypothesis 2. This is important for two reasons. First, it suggests that members of the public perceive some Court decisions as more important than others, and this is due to more than mere exposure to the information. Respondents from both groups in each study had roughly equal access to the information, but those from the immediate community perceived the issue as more important. Second, this finding is important as a basis for the underlying assumption of the final hypothesis, that Court decisions have an effect on evaluations of the Court, especially among those from the immediate community.

Evaluation of the Court

Hypothesis 3 predicts that initial support for (opposition to) what the Court ultimately decides should increase (decrease) support for the Court. Furthermore, and as hypothesis 4 predicts, this effect should be greater among those from the immediate community than from surrounding areas. People in the immediate community who support (oppose) the ultimate decision

should show a greater increase (decrease) in support for the Court than do people in the surrounding areas.

To create the dependent variable for measuring change in support, I simply subtracted the evaluation of the Court the respondent offered in the first wave from the evaluation offered in the second wave. The measure consisted of asking people whether they approved or disapproved of the Court, followed by a question asking how strongly. Responses were combined into a seven-point scale. The differenced dependent variable was calculated such that positive values indicate greater support for the Court following the decision, whereas negative values indicate a less favorable evaluation.

Four independent variables were included in the analysis. Initial Evaluation of the Court was measured from 1 (disapprove very strongly) to 7 (approve very strongly). This was used for both statistical and substantive reasons. Statistically, it controls for any regression effects, which is the tendency for extreme values to become less extreme on subsequent measurement (Finkel 1995; Markus 1990). Since regression to the mean is movement in the opposite direction, initial values may be negatively related to subsequent values, and the coefficient should be negative. Substantively, a simple transformation of the coefficient $(1 + \beta)$ provides information relevant to interpretation. The number that results from this transformation is the same as would result if the level of support for the Court at the second wave (rather than change in support) was regressed on the level of support at the first wave (see

¹¹ I do not present the data, but pooling across the samples yields virtually the same picture. Members of the immediate community rated the issue more important across all four measures, but the differences are statistically significant for personal importance, community importance, and the summary measure.

Note: The measure of support for the Court was not included in the second wave of the Center Morlohes study. *p < .05, **p < .01; one-talled hypothesis test. Standard errors are in parentheses.

Finkel 1995). That is, it is equivalent to the effect of prior evaluation of the Court on subsequent evaluation. For example, if the effect of prior evaluation of the Court on change in evaluation were -.35, this would mean a portion of the change is due to stability (1 + [-.35] = .65), or about 65% of the current support of the Court is explained by prior support. Since the conventional wisdom is that the Court is insulated from the effect of its decisions, the more cautious approach is to include prior evaluation.

The second independent variable is the respondent's initial opinion on the issue in the case (Initial Opinion on the Issue). This is measured on a seven-point scale; 1 indicates initially very strong disagreement (with the position the Court ultimately adopted), and 7 indicates initially very strong agreement. The coefficient on this variable should be positive. The third variable is town of residence, coded 1 for residents of the immediate community, 0 otherwise. Finally, an interaction term (initial opinion × town of residence) tests hypotheses 3 and 4. Positive and significant values indicate that the effect of agreement or disagreement is greater among those from the immediate community than those from the surrounding areas.

The results are presented in Table 6. Note that prior evaluation of the Court proves significant in two of the three studies. Thus, some of the change is due to regression effects. Prior attitudes do spill over into current evaluations, as previous research would lead us to expect. In Monroe, the coefficient of -.23 suggests that about 77% (1 + [-.23]) of previous opinion explains current evaluation. In Oregon, the figure is about 53%. In Oklahoma, the coefficient is not statistically significant.

Yet, prior attitudes do not explain all the change. Decisions indeed alter feelings about the Court, as suggested by the interaction between town of residence and (dis)agreement with the decision rendered. The coefficient is significant in all three studies. It is in the predicted direction for Monroe and Oregon but in the opposite direction for Oklahoma.

Looking first at Monroe, the interaction (.20) suggests that those who reside in the immediate community and approve of the Court's decision became more supportive than those who reside in the surrounding areas and approve of the decision. Conversely, those from the immediate community who disagree with the decision became less supportive, and to a greater extent, than those from the surrounding areas who disagree. The results are virtually the same in the Oregon study. In the Monroe study, however, the statistically significant and negative coefficient on town of residence (-1.08) suggests that among those from the immediate community, the effect of disagreement may be stronger than agreement. This may be similar to negativity effects that have been found in other areas of political behavior (e.g., Lau 1985).12 The town of residence variable in the Oregon study is also negative but not significantly so.

In the Oklahoma study, the interaction shows that the effect is in the opposite direction hypothesized. This suggests that members of both communities changed their opinion in accordance with how the Court decided (hypothesis 3), but the effect was greater in surrounding areas than in the immediate community. Monroe and Oregon are statistically significant at p < .05. In the Oklahoma study, the overall model does not quite reach conventional standards of statistical significance (p = .11). 13

CONCLUSION

Court decisions matter. When the issue is perceived as important and is covered by the media, the public exhibits rather surprisingly high levels of awareness. In addition to geographic proximity, awareness is affected by education, gender, attention to the media, and the frequency of political discussions. At the very least, we ought to be skeptical about research suggesting that Court decisions go unnoticed by the public. Most people may not know about most, or even many, of the rulings, but they do hear about those that have some relevance to their community. Furthermore, there is evidence that satisfaction with those decisions influences subsequent evaluations of the Court. This is not to say that satisfaction is the sole factor, only that decisions may be an ingredient in individual levels of

¹² Another possible explanation for the statistically significant coefficient may be that, on average, those from the immediate community felt less support for the Court's decision than did those from the surrounding communities. If so, the town of residence variable might pick up some of that effect. Among those who heard about the decision, however, there was no statistically significant difference in support for it between those in the immediate and surrounding communities.

¹³ I do not present the pooled results, but they lend mixed support to the hypotheses. Initial evaluation proved statistically significant and in the correct direction, but no other variable proved significant. The reason should be fairly clear. Expectations were similar across the samples, but the results were not.

support. The effect of unpopular decisions is mitigated to some extent by the perception that the Court operates in a less political, partisan, or ideological fashion than other branches, as the process argument maintains (Hibbing and Theiss-Morse 1995). The dynamic argument advanced by other scholars is also supported by the data (Caldeira and Gibson 1992; Mondak and Smithey 1997). Prior evaluations of the Court carry over into subsequent assessments after hearing about specific rulings.

The findings also suggest a more generalizable theory of the influence of Supreme Court decisions. I examined specific communities, but so long as people identify with the parties involved and there is some way to hear about cases, we could expect analogous results. This is consistent with research that found Catholics are likely to hear about the Court's abortion decisions in church (Franklin and Kosaki 1989) or that people hear about decisions related to their work (Berkson 1978). It is also consistent with the material on national levels of awareness given in Table 2. Although I presented the Franklin, Kosaki, and Kritzer data (1993) to show that local awareness exceeds national awareness, the latter was substantial in many cases, too. It is not a great leap to suggest that people across the nation who heard about those cases may have changed how they feel about the Court. Geography is one place to look for such an effect, and the media results suggest that it is probably common. Yet, there are many types of communities other than geographical where this may occur. Future research should examine other audiences for Supreme Court decisions to arrive at a more thorough description of the bases of individual support for the Court.

The four cases I studied originated in various parts of the nation, but large metropolitan areas such as New York City or Los Angeles were not included, so it is impossible to generalize to such a sizable and diverse community. The effect in very populous areas may be smaller, since any single news story must compete with so many others in a given day. Nevertheless, when people hear about a case, and at some point most people do, it has the potential to affect how they feel about the Court.

The implications for theories of support are important. Although the Court tends to be more popular than other institutions of government, we have not been able to pinpoint the reasons. As with many other aggregate measures, individual patterns may be hidden (see also Mondak and Smithey 1997). In each study presented here, neither uniform support nor opposition emerged. Some people were pleased with the ruling and became more favorable to the Court, others were displeased and felt less favorable. As with public opinion in general, on these issues it was divided. Therefore, aggregate data can mask individual behavior.

The fact that decisions have an effect on support for the Court presents an unusual problem. Because the public is assumed to be ignorant of rulings, the Court is typically thought to be relatively isolated from public opinion. My research suggests we should be less pessimistic about public knowledge of Supreme Court decisions. My focus was local geographic areas, but we should carefully and systematically think about and look for similar effects in other types of communities.

APPENDIX A. SAMPLING

The sampling frame for the Center Moriches study was 326 working telephone numbers. Of these, 212 were contacted and agreed to participate in the first wave, for a response rate of 65%. For the second wave, 112 were successfully recontacted and agreed to participate, for a retention rate of 52.8%.

For the Monroe study, the sampling frame was 300 working numbers, and 167 agreed to participate in the first wave, for a response rate of 55.67%. Of these, 122 were successfully recontacted and agreed to take part in the second wave, for a retention rate of 73.1%.

In the Oklahoma study, 206 people participated in the first wave, which from a sampling frame of 395 means a response rate of 52.15%. The second wave consisted of 116 of those respondents, for a retention rate of 56.3%.

The Oregon study had a sampling frame of 413 numbers. The 243 people who took part yielded a response rate of 58.8%. For the second wave, 145 of them participated, for a retention rate of 59.7%.

Overall, among the 836 individuals in the first wave, 495 were contacted after the Court's decision and agreed to be interviewed again.

APPENDIX B. SURVEY ITEMS ANALYZED

How many days in the past week did you watch the news on TV?

How many days in the last week did you read a daily newspaper?

How many days in the last week did you discuss politics with friends or family members?

Next, I'd like to ask your opinion on a few issues being discussed in the news lately. We understand that most people may not have the time or interest to follow every issue in the news. However, we are interested in knowing how you feel about a few of these issues, how much time you spend thinking about these issues, and how important they are to you.

Center Moriches. Do you feel that a religious group ought to be allowed to use public school facilities after school hours if other community groups are allowed to use the facilities, or do you believe that a church should not be allowed to use the school facilities?

Monroe. Do you believe that it is all right for school districts to be specially created for a community sharing a common religious faith, or do you believe that there should not be special consideration of religious beliefs when creating school districts?

Oklahoma. Do you think Oklahoma's gasoline tax should be collected on gasoline sold by Native Americans on tribal land, or do you think the government should not be involved in tribal business?

Oregon. Do you think the government should protect the habitat of endangered species with strict building restrictions? Or do you think the government goes too far in protecting endangered species?

Do you hold this opinion very strongly, strongly, or not so strongly?

Compared to other issues you might think about, how much time do you spend thinking about this sort of issue? Would you say you think about it a lot of the time, some of the time, or not much time?

Compared to other issues you might think about, how important do you think this issue is to you personally? Would you say it is very important, somewhat important, or not very important?

Compared to other issues you might think about, how important do you think this issue is to your community? Would you say it is very important, somewhat important, or not very important?

Now let's consider the way the U.S. Supreme Court makes decisions. I'm going to read you a series of statements. After I read each of these statements please tell me whether you strongly agree, agree, disagree, or strongly disagree with the following statements.

In general do you approve or disapprove of the way the Supreme Court is handling its job?

Do you approve/disapprove very strongly, strongly, or not strongly?

What is the highest grade of school or year of college you have completed?

What town do you live in?

We understand that most people may not have the time or the interest to follow everything that happens in the news. However, we are interested in knowing whether or not you have read or heard anything in the news recently about the issue of (issue in case)? (If yes, asked to explain.) (If they mention the Supreme Court:) And how did the Supreme Court decide?

Strategic Auditing in a Political Hierarchy: An Informational Model of the Supreme Court's Certiorari Decisions

CHARLES M. CAMERON Columbia University JEFFREY A. SEGAL SUNY at Stony Brook DONALD SONGER University of South Carolina

e examine how the Supreme Court uses signals and indices from lower courts to determine which cases to review. In our game theoretic model, a higher court cues from publicly observable case facts, the known preferences of a lower court, and its decision. The lower court attempts to enforce its own preferences, exploiting ambiguity in cases' fact patterns. In equilibrium, a conservative higher court declines to review conservative decisions from lower courts regardless of the facts of the case or the relative ideology of the judges. But a conservative higher court probabilistically reviews liberal decisions, with the "audit rate" tied to observable facts and the ideology of the lower court judge. We derive comparative static results and test them with a random sample of search-and-seizure cases appealed to the Burger Court between 1972 and 1986. The evidence broadly supports the model.

rierarchical control of organizations is problematic throughout the realm of politics. Congress and presidents attempt to control agencies, upper levels of bureaucracies attempt to control lower levels, and higher courts strive to control lower courts. With incomplete information about their subordinates' decisions and knowledge, superiors in rule-based hierarchies often employ some form of auditing. In this article we study how the Supreme Court uses signals and indices from lower courts to pluck a relative handful of cases from a plethora of potential candidates for review. Our point of departure is the role of review in enforcing the doctrinal preferences of the Supreme Court within the judicial hierarchy.

We begin by presenting a game-theoretic model of the Court's certiorari process. The model goes much farther than earlier efforts to incorporate concepts commonly employed by judicial scholars. For example, we include the legal concepts of case facts, doctrine, and holding; formalize the attitudinal model; and include an explicit role for judicial culture. Most important, the model puts asymmetric information at its analytic center, following the hints in recent empirical

Segal is Professor of Political Science, State University of New York at Stony Brook, Stony Brook, NY 11794 (Jeffrey.segal@sunysb.edu). Donald R. Songer is Professor of Government and International Studies, University of South Carolina, Columbia, SC 29208 (dsonger@sc.edu).

We acknowledge the support of National Science Foundation Grant SES-9112755 and thank seminar participants at the 1995 annual meeting of the Midwest Political Science Association, the 1997 annual meeting of the Law and Society Association, Berkeley Business School, New York University Law School, the University of Iowa, Stanford Graduate School of Business, the University of Southern California Business School, Washington University, SUNY Binghamton, and George Washington University. We also thank Greg Caldeira, Alessandra Casella, Lee Epstein, John Ferejohn, Andrew Gelman, Lewis Kornhauser, Nolan McCarty, John Matsusaka, Richard Revez, David Z. Seide, Charles Shipan, Pablo Spiller, Matt Spitzer, Oliver Williamson, the anonymous referees, and especially Jean-Pierre Benoit for their extremely helpful comments Cameron gratefully acknowledges additional support from the Hoover Institution, Stanford University.

studies based on interviews with justices of the Supreme Court and their clerks (Perry 1991).

The model explains several well-established patterns in certiorari, such as the importance of amicus briefs by the Solicitor General. It also generates several entirely new and nonobvious predictions. We test the predictions on a random sample of 274 decisions in the area of search-and-seizure law heard in the U.S. Courts of Appeals and appealed to the Supreme Court during the Burger years. The data strongly display the patterns predicted by the model. Thus, in addition to contributing to the certiorari literature, we hope to advance the burgeoning literature on the strategic behavior of courts (e.g., Caldeira and Wright 1988; Epstein and Knight 1998; Hall 1992).

The article is organized as follows. We first discuss the role of information in the certiorari process and the place of certiorari decisions in the incentive system of the judicial hierarchy. We then present the formal model, followed by the empirical analysis. We next discuss the implications of the findings and offer conclusions in the final section. All proofs are gathered in the Appendix.

INFORMATION AND INCENTIVES IN THE **CERTIORARI PROCESS**

The Supreme Court's decision to hear a case—in legal parlance, to grant certiorari—is perhaps the best studied area of the high court's decision making. A full review of the literature is outside the scope of this article and is unnecessary here, but it is helpful to review several major themes relevant to these decisions.1

¹ The Supreme Court uses the Rule of Four to grant certiorari, but a majority is necessary to prevail on the ments. Presumably, forwardthinking justices take the latter into account when voting to grant certiorarl. Absent a careful analysis of the strategic properties of the Rule of Four (to the best of our knowledge, no formal model of this procedure has appeared in print), we treat the Court as a unitary actor with respect to the lower courts.

Certiorari and incentives in the Judicial Hierarchy

Certiorari and Interactive Incentives. The certiorari system creates incentives for upper and lower courts alike. One cannot get very far with a deductive theory of certiorari without thinking about those incentives, but a strange feature of the contemporary field of judicial politics is that the literatures on certiorari decisions and judicial compliance have developed largely independently. Most of the empirical studies of certiorari decisions ignore doctrinal deviations by lower courts (we note some exceptions below). In turn, empirical studies of the responsiveness of lower courts to Supreme Court precedent typically ignore review probabilities. In other words, there has been scant appreciation of the fact that the certiorari process creates an interactive incentive system between higher and lower courts, with the behavior of appellate courts affecting the behavior of the Supreme Court and vice

A partial exception is the empirical work of Ulmer (1984), who used conflict with Supreme Court precedent as a predictor of certiorari, although he did not recognize that the probability of certiorari is apt to affect conflict with precedent. Ulmer noted that counsel for appellants seem to believe conflict with precedent galvanizes the Court into granting certiorari because such conflict is claimed in more than half of all petitions (six or more conflicts were claimed in more than 10% of the petitions). Attorneys may try to manipulate this cue by padding their claims about conflicts, so Ulmer tried to classify his sample into cases that do and do not contain "real" conflict with precedent. Using this distinction, he found that actual conflict is the single most important variable for understanding grants of certiorari; it explains a higher proportion of the variance than any of the other cues noted by Tanenhaus et al. (1963) and other scholars.

Ulmer's subjective coding of conflict is not amenable to replication, however. Moreover, his analysis puts dated precedents and more recent ones on a par although lower courts almost certainly defer more conscientiously to the preferences of the contemporaneous Court. Finally, Ulmer's dichotomization of real conflict leaves little room for nuance. Many scholars recognize that conflict involves subtle gradations of noncompliance (Feeney 1975). Nonetheless, one cannot read Ulmer's analysis without becoming aware of certiorari as a tool for policing the doctrinal decisions of lower courts.

Even if one accepts that certiorari creates an interactive incentive system, formalizing a model of it requires answers to two more questions. What does doctrinal compliance really mean? What sanctions and rewards are available to the Supreme Court if it detects noncompliance?

Doctrinal Compliance. The concept of a legal doctrine is central to the process of legal reasoning. What is a legal doctrine, and what does it mean to comply with a doctrine? We take as fundamental the conception implicit in classic descriptions of legal reasoning (e.g.,

Levi 1948): A legal doctrine indicates which fact situations are to be grouped together and treated similarly. In other words, it creates a set of equivalence classes in a fact or case space (Kornhauser 1992). When a lower court conforms to a legal doctrine, it accepts the equivalence classes defined by the higher court and acts in accordance with them. Nonconformity means that the lower court treats the case inappropriately for the class to which the case belongs. This concept of doctrine can be seen as an example of the broader notion of rule-governed behavior, a phenomenon general to bureaucracies. We formalize (part of) these conceptions of doctrine and doctrinal compliance below and employ them in the empirical analysis.

Sticks, Carrots, and Culture. What sanctions or rewards can a higher court bring to bear on lower courts that do not comply with its doctrine? In the American system of jurisprudence, the formal answer is "very few." Higher courts cannot promote, demote, or fire; they cannot cut salaries, give bonuses, or offer stock options. Thus, the Supreme Court possesses none of the motivational tools typically employed by hierarchical superiors. This is one of the most striking features of the federal judiciary considered as a hierarchical organization.

A focus on traditional motivational tools is too constricted a view of judges, however. In fact, two sources of control are available to higher courts. First, lower courts care about the disposition of cases: They wish to see justice done, at least as they conceive it. If a higher court reverses the decision of a lower court, the latter may well view the ultimate disposition of the case as much less attractive than if its judgment had stood. Hence, reversal itself can be a kind of sanction, at least for judges who care about the disposition of cases. Second, informal sanctions supplement the formal rules. "Judicial culture" famously includes a desire to avoid reversals. Frequent reversals bring the derision of colleagues and a decline in professional status. Higher courts are well aware of this sanctioning power. For example, Perry (1991, 267) notes that Supreme Court clerks "frequently talked about the need to 'slap the wrist' of a judge below." The importance of judicial culture should not be surprising. Federal judges belong to a very special and relatively close-knit society, and their informal culture is apt to affect their decisions.

Enforcing Doctrine Versus Creating Doctrine. Our model stresses the role of certiorari in enforcing doctrine, but this is a very partial view of the process. Perhaps equally important is the selection of cases as vehicles for creating new doctrine, for example, in novel fact situations. These often occur in the context of intercircuit conflict, when different circuits take different positions on new issues, which the Court must then answer. Indeed, the incremental, fact-soaked creation of new rules is one of the most interesting and distinctive elements of judicial politics. The justices' emphasis on finding "good" cases and "well-percolated" cases underscores this important part of the certiorari process (Perry 1991, chap. 8). In addition, the model ignores aggressive grants, that is, situations in

which the Supreme Court grants certiorari in order to affirm a lower court decision and make it binding on the entire nation.²

We defend the approach we take by noting that law creation is an important part of certiorari, but modeling it involves even more complex theoretical issues than the enforcement of doctrine, which is our focus. The development and testing of a rigorous theory of doctrinal enforcement is an important step toward a more general theory of the judicial hierarchy.

Structure of the Hierarchy. Our analysis simplifies the judicial structure into upper and lower courts. In reality, the federal judicial hierarchy has three levels, and courts at the first level play an important role in fact-finding. Our simplified structure enables us to explore the essential principal-agent dilemma. Extensions to this model could examine additional features of the judicial hierarchy, such as the special role of trial courts.

information and Certiorari

From "Cue Theory" to Strategic Manipulation. Political scientists have long recognized the central importance of information in the Supreme Court's certiorari process. Tanenhaus et al. (1963) argue that the Court must economize in its search for information, since each year it is confronted with a blizzard of cases and tens of thousands of pages of documents. In particular, they argue, the Court is apt to rely heavily on easily distinguishable but highly informative "cues," such as splits in the lower court, to winnow out the potential cases of interest.

Tanenhaus's cue theory, as it came to be known, provoked a flurry of empirical work that continues to this day. Studies tried to determine which cues the Court uses (if any), whether cues are dispositive or merely suggestive, and whether the Court's use of cues changes over time (Armstrong and Johnson 1982; Teger and Kosinski 1980). Development of the underlying theory of information acquisition received little attention, however. Consequently, scholars largely ignored the strategic manipulation of cues, although they soon recognized the importance of reputation in the behavior of the Solicitor General (Caldeira and Wright 1988; Tanenhaus et al. 1963; Ulmer 1984).

The neglect of the strategic dimension of cue theory began to change when Caldeira and Wright (1988) demonstrated the effect of amicus briefs on the probability of granting certiorari. When coupled with new findings about the litigation strategies of interest groups, Caldeira and Wright's finding strongly suggests that at least one cue, the presence of an amicus brief,

is deliberately manipulated by interested parties in order to affect the behavior of the Court (Epstein 1991). This move to greater theoretical sophistication continued in Perry's (1991) landmark study of the certiorari process. Perry adopted concepts from Jervis's (1970) classic work on signaling in international relations, including the distinction between *signals*, which are manipulable, and *indices*, which are not. Nonetheless, Perry did not address many of the issues that occupy center stage in game-theoretic accounts of signaling.

Meaning and credibility in certiorari signaling. Contemporary signaling theory revolves around two issues: meaning and credibility (Banks 1991; Farrell 1993). With respect to meaning, the key issues are the identity of the signal sender, the nature of his or her private information, and the interpretation of the message by the signal receiver. In the context of certiorari, the obvious questions are: Who is the signaler? What does the signaler know that the Supreme Court does not? What signals might reflect this private information? How can the Court understand or interpret the signal? With respect to credibility, the key issue is sometimes called "the Jervis paradox": If sending a particular message benefits a signaler with private information, then why do not others without the information do the same thing? If they do, then why does this not destroy the credibility of the message? In the context of certiorari, if a lower court that follows Supreme Court doctrine can signal its conformance by sending a particular message, then why do not courts who flout doctrine send the same signal? If they do, how can the signal from the first court credibly convey the intended message: "There is no need to review me since I am conforming to your doctrine"? The contemporary theory of signaling games provides powerful tools for answering these questions.

A JUDICIAL SIGNALING GAME

The Model

Our model shares some similarities with other auditing models in the social sciences, such as the importance of mixed strategy equilibria, but its structure differs from most others in three ways: It includes a publicly observable index, the message space for the signaler is restricted to two actions, and both actors agree about the disposition of some cases even when they differ strongly about others. Consequently, the equilibria in our model also differ in some regards from most others (for a review of those models and their characteristics, see Andreoni, Erard, and Feinstein 1998).

The players are higher court H and lower court L. Play of the game determines the legal disposition of a search-and-seizure case. A "case" is a set of facts (i.e., a point in a fact space). Each point in the fact space corresponds to a degree of intrusiveness of the search. That is, points in the fact space map into the real line X, where each point x indicates a degree of intrusiveness. Each case thus corresponds to a point x in X.

² Overall, 23.3% of the search-and-seizure cases were affirmed by the Burger Court (U.S. Supreme Court database, using orally argued citation and split vote as the unit of analysis). Some of these affirmations may be consistent with our model. That is, because of differences between the observed and actual intrusiveness of the search, the Court may take a case that seems suspect only to find on further review that it was correctly decided.

³ Cue theory aside, strategic analyses of certiorari date to Schubert 1959; also see Brenner 1979.

Some of the facts in a case are publicly observable, others are not. For example, it is easily determined whether a search took place in a car or home, or whether a warrant was issued; whether the police had "probable cause" for the search is a more difficult determination that can only be reached after careful review of evidence and testimony.

Let $x = \hat{x} + t$, where \hat{x} is the intrusiveness of the case based on the publicly observed facts, and t is an additional increment or decrement of intrusiveness based on the nonpublicly observable facts. We assume $t \in T = X$ and is distributed according to distribution F, with common knowledge density f assumed everywhere continuous, differentiable, and nonzero. We assume throughout that F is log concave (displays the monotone hazard rate property). This condition is met by most common probability distributions, including the normal, logistic, chi-squared, exponential, and Laplace (Bagnoli and Bergstrom 1989). We further assume the density f(t) is independent of the realization of \hat{x} .

Sequence of Play, Information Structure, and Strategies. The lower court hears the case, learns all the facts in the matter (i.e., it learns \hat{x} and t and hence x), and either admits or excludes the evidence. The higher court sees only the publicly observable facts (i.e., it learns \hat{x} but not t) and the decision of the lower court. H may deny certiorari (i.e., decline to review the case), and L's decision stands. Or, at cost k, H may review the case, learn the private information t, and affirm or reverse L.

Given this information structure, the action of L becomes a "signal" about its private information, exactly as noted by Songer (1979), while the publicly observable degree of intrusiveness becomes an "index" in Perry's terminology.

A strategy for L is a function

$$s: T \times X \to \Delta(M)$$
,

where $\Delta(\cdot)$ denotes the set of probability distributions over a finite set, and $M = \{m_1, m_2\}$, with $m_1 = \text{exclude}$ and $m_2 = \text{admit}$. Thus, $s(t; \hat{x})$ gives the probability of excluding the evidence given the private information t and the public information \hat{x} .

If H hears the case it will affirm or reverse L in such a way that the evidence is admitted or excluded according to its own preferred doctrine. Hence, we can take H's strategy as simply a reviewing or auditing strategy:

$$r: M \times X \to \Delta(A)$$
,

where $A = \{a_1, a_2\}$, with $a_1 =$ grant certiorari and $a_2 =$ deny certiorari. Thus, $r(m_i; \hat{x})$ is the probability of granting certiorari given action m_i by L and the observable degree of intrusiveness \hat{x} .

Preferences. Both courts have preferences defined partly in relation to the ultimate disposition of the case. Each wishes the case to be adjudicated correctly, given its own notions of justice. More specifically, each has a preferred legal rule, which uses a cut-point x_i in X, i = 1

H, L. Court i believes the evidence should be excluded in cases that are more intrusive than x_i and admitted in cases less intrusive than x_i . This captures the notion of a legal rule or doctrine and the "correct" versus "incorrect" dispositions of cases, concepts of critical importance in the judicial setting. Each court wishes to decide cases correctly in view of its preferred legal rule. Note, however, that the two courts differ in the value of the ideal doctrinal cut-point. The reason courts prefer different legal rules is not modeled here, but it could result, for example, from different perceptions of the social costs and benefits of curbing the police.

The unidimensional space X is exactly the "attitude" space of the "attitudinal model" assumed in many empirical studies of judicial decision making (Segal and Spaeth 1993). The ideal cut-point partitions the space in precisely the fashion noted in attitudinal studies. This partitioning, combined with the mapping from the *n*-dimensional fact space into the unidimensional attitude space, in turn partitions the fact space in exactly the way required by the concept of a judicial doctrine. Conveniently, however, most of the action of the model takes place in the simple attitude space.

To complete the specification of the doctrinal component of preferences, we normalize each player's payoffs. If a case is decided correctly from its perspective, then the court receives a payoff of 0; if incorrectly, the payoff is -1. This stylization reflects the different value of a correct versus an incorrect decision to the courts while simplifying the development and exposition of the model. In the interest of brevity and clarity in presentation, we take $x_L < x_H$ so that H is more conservative than L; results concerning the other, completely symmetrical, case are noted where appropriate.

In addition to preferences about outcomes, L prefers not to be reversed. If reversed, it suffers an $\epsilon > 0$ utility loss; this loss reflects the influence of judicial culture. We do not try to account for the origin or maintenance of this loss, although one can view it as sustained through repeated play within the legal community. Finally, the higher court loses $k \in (0,1)$ if it hears the case. This auditing cost reflects the time and effort of hearing the case, which involves a cost in other cases unheard and in leisure and other activities forgone. Given the normalization of the payoffs, ϵ and k can be seen as the utility losses from reversal and auditing relative to the utility loss of an incorrectly decided case.

$$= \begin{cases} 0 \text{ if } & \begin{cases} x < x_H \text{ and } m = \text{ admit and } a = \text{ deny} \\ x \ge x_H \text{ and } m = \text{ exclude and } a = \text{ deny} \end{cases}$$

$$= \begin{cases} x < x_H \text{ and } m = \text{ exclude and } a = \text{ deny} \\ x \ge x_H \text{ and } m = \text{ admit and } a = \text{ deny} \end{cases}$$

$$-k \text{ if } a = \text{ grant}$$

⁴ We bound the auditing cost by 1; otherwise, the higher court would never find it profitable to review cases (since the most it can gain as a result, exclusive of the auditing cost, is 1).

and for the lower court:

 $\begin{cases} x < x_L \text{ and } m = \text{admit} \\ x_L \le x < x_H \text{ and } m = \text{exclude and } a = \text{deny} \\ x \ge x_H \text{ and } m = \text{exclude} \end{cases}$ $\begin{cases} x < x_L \text{ and } m = \text{exclude and } a = \text{deny} \\ x_L \le x < x_H \text{ and } m = \text{admit} \\ x \ge x_H \text{ and } m = \text{admit and } a = \text{deny} \end{cases}$ $-1 - \epsilon \text{ if } x_L \le x < x_H \text{ and } m = \text{exclude and } a = \text{grant}$ $-\epsilon \text{ if } \begin{cases} x < x_L \text{ and } m = \text{exclude and } a = \text{grant} \\ x \ge x_H \text{ and } m = \text{admit and } a = \text{grant} \end{cases}$

Expected Utilities and Best Responses. The expected utility for the lower court from strategy $s(t; \hat{x})$ follows straightforwardly:

$$u_{L}(s(t; \hat{x}))$$

$$= \begin{cases} s(t; \hat{x})[r(m_{1}; \hat{x})(1 - \varepsilon) - 1] & \text{if } x < x_{L} \\ s(t; \hat{x})[1 - r(m_{1}; \hat{x})(1 + \varepsilon)] - 1 & \text{if } x_{L} \le x < x_{H} \\ (1 - s(t; \hat{x}))[r(m_{2}; \hat{x})(1 - \varepsilon) - 1] & \text{if } x \ge x_{H}. \end{cases}$$

L's best-response correspondence is immediate:

$$BR_L(r(m; \hat{x}), t; \hat{x})$$

$$s(t; \hat{x}) = 0 \quad \text{if} \begin{cases} x < x_L \\ x_L \le x < x_H \text{ and } r(m_1; \hat{x}) > \rho \end{cases}$$

$$= \begin{cases} s(t; \hat{x}) \in [0, 1] & \text{if } x_L \le x < x_H \text{ and } r(m_1; \hat{x}) = \rho \end{cases}$$

$$s(t; \hat{x}) = 1 \quad \text{if} \begin{cases} x \ge x_H \\ x_L \le x < x_H \text{ and } r(m_1; \hat{x}) < \rho, \end{cases}$$

where $\rho = 1/(1 + \epsilon)$.

L's best response correspondence indicates there are three strategically distinct regions in X: the region below x_L , the region between x_L (inclusive) and x_H , and the region above x_H (inclusive). If x falls into the first region, then L always admits the evidence; if x falls into the third region, then L always excludes the evidence; if x falls into the second region, the "conflict region," then L admits or excludes the evidence depending on whether the probability of certiorari (given exclusion and the observable facts) falls above or below a critical value ρ . If x falls into the conflict region and the probability of certiorari equals ρ , then L is indifferent between admitting and excluding the evidence and may randomize between the two pure strategies in any fashion.

This best-response correspondence is quite intuitive. The interests of the two players correspond when x is very high or very low (i.e., at or above H's ideal cut-point or below L's). Therefore, when x falls into those regions L can pursue her ideal policy without fear of reversal, yielding L a best response that is invariant to H's strategy. When x falls into the conflict region, the interests of the players are opposed. In this

case, a sufficiently imposing chance of reversal will keep L from pursuing her ideal policy. For cases that fall into the conflict region, the role of reversal costs is critical; as the cost of reversal falls to zero, the probability of an audit must go to one if the lower court is to be dissuaded from implementing its own preferred doctrine.

Finally, note that for any set of observable facts \hat{x} it is possible for L to have the best response "admit" or "exclude" (since by assumption $F(t_a) > 0$ and $1 - F(t_b) > 0$, where $t_a = x_L - \hat{x}$ and $t_b = x_H - \hat{x}$). This has an important implication: All information sets can be reached in equilibrium, so the need to determine beliefs at unreached information sets does not arise.

Let $\mu(x; m_i, \hat{x})$ denote H's beliefs about x given the observable facts \hat{x} , L's action m_i , and L's strategy. For example, $\mu(x < x_H; admit, \hat{x}')$ indicates the probability H puts on x lying below x_H after observing "admit" in a case with observable obtrusiveness \hat{x}' . The following fact is important: Given L's best-response correspondence, H's beliefs about x must be concentrated on the region below x_H after having observed "admit," regardless of the value of \hat{x} . Therefore, after observing "admit," the expected utility to H of review strategy $r(admit, \hat{x})$ must be $-r(\cdot)k$. This expression is maximized at $r(admit, \hat{x}) = 0$ for all \hat{x} . Accordingly, in any equilibrium, $r(admit, \hat{x}) = 0$ for all \hat{x} .

In addition, given L's best-response correspondence, H's belief about x must be concentrated above x_L following the observation of "exclude," regardless of the value of \hat{x} . Recall that the payoff to H from denying certiorari given exclusion is zero if $x \ge x_H$ but -1 if $x < x_H$. Therefore, following the observation of "exclude," the expected utility to H of review strategy $r(exclude, \hat{x})$ is for all \hat{x}

$$-r(exclude, \hat{x})k - (1 - r(exclude, \hat{x}))\mu(x_L \le x$$

$$< x_H, exclude, \hat{x}), \tag{1}$$

where, from Bayes's rule,

$$\mu(x_L \le x < x_H, exclude, \hat{x})$$

$$= \frac{\int_{t_a}^{t_b} s(\hat{x} + t) f(t) dt}{1 - F(t_b) + \int_{t_a}^{t_b} s(\hat{x} + t) f(t) dt}$$

(recall that $x_L = \hat{x} + t_a$ and $x_H = \hat{x} + t_b$). The solution to maximizing expression 1 with respect to $r(exclude, \hat{x})$ depends on the relative magnitudes of k and $\mu(x_L \le x < x_H, exclude, \hat{x})$. Thus, in any equilibrium, for all \hat{x}

$$r(exclude; \hat{x}) = \begin{cases} 1 \text{ if } \mu(x_L \le x < x_H) > k \\ \alpha \in [0, 1] \text{ if } \mu(x_L \le x < x_H) = k \\ 0 \text{ if } \mu(x_L \le x < x_H) < k. \end{cases}$$
(2)

Equilibria

We seek perfect Bayesian equilibria (PBE) to the judicial signaling game. In doing so it is convenient to consider a level of \hat{x} , \hat{x}^* , such that H's posterior belief about the true location of the case, given observed \hat{x} and "exclude" by L, leave him just indifferent between granting and denying certiorari, even if L definitely excludes the evidence for all cases truly lying in the conflict region (i.e., even if $s(t,\hat{x}) = 1 \ \forall \ x \in [x_L, x_H)$). Using the middle part of equation 2 and Bayes's rule, \hat{x}^* is implicitly defined as the level of \hat{x} such that

$$\frac{F(t_b) - F(t_a)}{1 - F(t_a)} = k. \tag{3}$$

Note that \hat{x}^* may not exist if k is sufficiently large, that is, if the left-hand quantity in equation 3 is less than k for all values of \hat{x} . If \hat{x}^* does exist, then the assumption of log concavity of $F(\cdot)$ assures that it will be unique.

Proposition 1.

1. If x* does not exist, then the following is a unique PRE:

$$\mathbf{s}(\mathbf{t}, \mathbf{\hat{x}}) = \begin{cases} 0 & \text{if } \mathbf{x} < \mathbf{x}_{L} \\ 1 & \text{otherwise} \end{cases}$$
$$\mathbf{r}(\mathbf{m}, \mathbf{\hat{x}}) = 0 \quad \forall \mathbf{m} \text{ and } \forall \mathbf{\hat{x}}$$

and beliefs are determined everywhere by Bayes's rule.

2. If \(\frac{1}{2} \)* exists, then the PBE are characterized by:

$$s^*(t, \hat{x})$$

$$= \begin{cases} 1 & \text{if } \begin{cases} x \geq x_H \\ x \geq x_L & \text{and } \hat{x} \geq \hat{x}^* \end{cases}$$

$$= \begin{cases} \beta(t, \hat{x}) \in [0, 1] \text{ such that } \mu(x_L \leq x < x_H, \text{ exclude,}) \\ \hat{x}) = k & \text{if } x_L \leq x < x_H \text{ and } \hat{x} < \hat{x}^* \end{cases}$$

$$0 & \text{if } x < x_L \end{cases}$$

$$\mathbf{r}^*(\mathbf{m}_{\upsilon}, \mathbf{\hat{x}}) = \begin{cases} \frac{1}{1+\varepsilon} & \text{if } \mathbf{\hat{x}} < \mathbf{\hat{x}}^* \text{ and } \mathbf{m}_{\iota} = \text{exclude} \\ 0 & \text{if } \begin{cases} \mathbf{\hat{x}} \ge \mathbf{\hat{x}}^* \text{ and } \mathbf{m}_{\iota} = \text{exclude} \\ \mathbf{m}_{\iota} = \text{admit} \end{cases}$$

and beliefs are determined everywhere by Bayes's rule.5

Part 2 of the proposition allows a great deal of latitude in admissable strategies for L. The latitude arises for cases whose observable intrusiveness is below \mathfrak{X}^* and whose true location lies within the conflict region. Hence, part 2 describes many equilibria. In all these equilibria, however, H's posterior belief that x lies in the conflict region, after observing "exclude" and \mathfrak{X} , must exactly equal k. In this sense, all of L's strategies characterized in part 2 can be said to be

"belief equivalent." All would be observationally equivalent to an outside observer not privy to t.

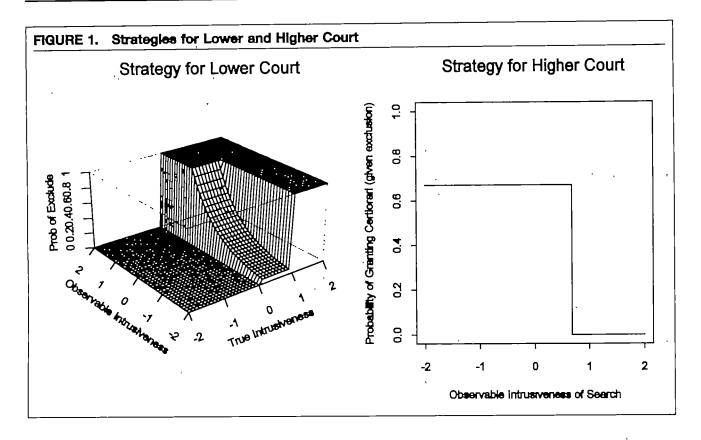

Example. Perhaps the best way to illustrate the review equilibria in part 2 of the proposition is through an example. Suppose $x_L = 0$, $x_H = 1$, $k = \frac{1}{2}$, $\epsilon = \frac{1}{2}$, and f is a normal distribution with mean zero and standard deviation 1. In this example, if $\hat{x} < \hat{x}^*$, then $s(t, \hat{x}) = s(t', \hat{x}) \forall x \in [x_L, x_H)$. In other words, if a case lies in the conflict region and $\hat{x} \leq \hat{x}^*$, then L keys the probability of excluding the evidence only on the case's observed intrusiveness.

Consider the strategy of the lower court, shown in the left-hand panel of Figure 1. If $x < x_L$ or $x \ge x_H$, then the lower court has obvious actions regardless of the value of \hat{x} . When $x < x_L$, the lower court admits the evidence; when $x \ge x_H$, the lower court definitely excludes the evidence. It can do so because even if audited it will not be reversed. If x falls into the conflict region, then L's strategy depends on the value of \hat{x} , the publicly observable level of intrusiveness. When £ is sufficiently high, at or above the critical level \hat{x}^* (which can be calculated to be about .69 in this example), the high court will not review the case even given exclusion of the evidence, for reasons explained below. Given this, the lower court can implement its preferred doctrine and exclude the evidence. When x is lower than \hat{x}^* , the lower court uses a probabilistic strategy keyed to the observable facts. For instance, when $\hat{x} =$.3, the probability of excluding the evidence is about

Now consider the strategy of the higher court. If it observes the admission of the evidence, then it accepts the lower court's judgment. This follows from the fact that L is more liberal than H, so any evidence it finds admissible will surely be found admissible by H as well. The higher court has a more difficult decision if it observes the exclusion of the evidence (the right-hand panel of Figure 1). If the true situation is $x \ge x_H$, then H would like L's judgment to stand and would prefer not to review the case. But if $x < x_H$, then H would like to review the case and reverses L, even though granting certiorari entails cost k. Unfortunately for the higher court, it can only observe \hat{x} and the fact of exclusion. So, given the observable degree of intrusiveness, the two ideal doctrinal cut-points, the cost of auditing, and the probability distribution F(t), the higher court must decide whether it is worthwhile to check the lower court after observing "exclude." When \hat{x} is large enough (equal to or greater than \hat{x}^*), it will not be worthwhile; that is, the probability that x truly falls into the conflict region between the two doctrinal cut-points will not be large enough to warrant the audit. When $\hat{x} < \hat{x}^*$, the higher court's calculation goes the other way. When H observes "exclude" from a liberal lower court, it employs a probabilistic auditing strategy keyed to the value of ε . In this case, the probability of granting certiorari after observing "exclude" is 3/3.

These strategies of the two players together determine outcomes. For example, if the liberal lower court admits the evidence, then the higher court does not

⁵ Recall that the proposition assumes the higher court is more conservative than the lower court. There is a "mirror" proposition when the higher court is more liberal than the lower court.

grant certiorari, and the lower court's decision stands. If the lower court excludes the evidence and $\hat{x} < .69$, then the higher court grants certiorari with a 3/3 chance. In the event of certiorari, if x actually falls in the conflict region, then H reverses L; if it does not fall in that region, then H affirms. (Note that the model predicts some grants and affirms as well as grants and reversals.) For instance, when x falls into the conflict region and $\hat{x} = .2$, L admits the evidence with a 42% chance and excludes it with a 58% chance; if it excludes, then H denies certiorari with a 33% chance, so the judgment stands, and grants certiorari with a 67% chance; if it so grants, then H reverses L. Finally, when $\hat{x} \geq .69$, L decides the case according to its own preferred doctrine, and H always denies certiorari, even if L excluded the evidence.

Meaning and Credibility. How do meaning and credibility play out in the model? The signals "admit" or "exclude" are inherently ambiguous, since x lies on a continuum, but the messages are dichotomous (i.e., the most informative equilibrium can only be a partial pooling equilibrium). Because L is liberal, however, the meaning of the signal "admit" (i.e., $x < x_H$) is sufficiently clear to make H's decision easy, provided the message is credible; indeed, the message is perfectly credible when L is more liberal than H. The signal "exclude" from L is also ambiguous, with more serious ramifications for H. A liberal lower court always (weakly) prefers the higher court to interpret "exclude" as meaning $x \ge x_H$, but this interpretation cannot be inherently credible because of the potential tension between the two courts. Instead, H uses an index, the observable degree of intrusiveness, to judge

the message credibility. If the observable facts indicate intrusiveness above the critical threshold \hat{x}^* , then the interpretation $x > x_H$ is sufficiently credible to warrant accepting L's decision. If not, then H will occasionally audit L. The audit rate will be keyed to the lower court's sensitivity to reversals, and sensitive courts will be audited less frequently than insensitive ones.

Hypotheses about Review

Because the model treats certiorari as part of an interactive incentive system, it generates hypotheses not only about the probability of review but also about the exclusion of evidence in the lower court. Both types of hypotheses can be used to test the model; because our primary interest is the certiorari decision, we focus on the former.

The first two hypotheses follow straightforwardly from the propositions but make explicit the consequences of a lower court that is more conservative than the higher court.

Hypothesis 1 (liberal admission or conservative exclusion). The probability the higher court grants certiorari is zero if $\mathbf{x}_L < \mathbf{x}_H$ and the lower court admits the evidence, or $\mathbf{x}_L > \mathbf{x}_H$ and the lower court excludes the evidence.

HYPOTHESIS 2 (liberal exclusion or conservative admission). (a) If $\mathbf{x}_L < \mathbf{x}_H$ and the lower court excludes the evidence, then the probability the higher court grants certiorari is zero only if the search is sufficiently intrusive $(\hat{\mathbf{x}} \geq \hat{\mathbf{x}}^*)$; (b) if $\mathbf{x}_L > \mathbf{x}_H$ and the lower court admits the evidence, then the probability the higher court

grants certiorari is zero only if the search is sufficiently unintrusive $(\hat{x} < \hat{x}^*)$.

A striking feature of these hypotheses, which are new to the literature, is the way the higher court's behavior depends on the lower court preferences relative to the higher court. The asymmetry of H's response to, say, "admit" arises because the meaning of the signal depends on the nature of the sender (a liberal or conservative lower court). These propositions—particularly the first, which might be called the Nixon goes to China proposition—are strongly reminiscent of Calvert's (1985) work on the value of information from a biased source ("if a cold warrior like Nixon goes to China it must be time for a change in American policy").

Now consider two circuit courts, both more liberal than the Supreme Court but one less liberal than the other. How does the critical value of the index \mathfrak{X}^* , the level of intrusiveness above which the Supreme Court does not review even following "exclude," differ for the two courts? This question is answered by the third hypothesis.

HYPOTHESIS 3 (proximity of lower court). Consider two lower courts. (a) If $\mathbf{x_L} < \mathbf{x_H}$ for both lower courts, then (i) the critical value $\mathbf{\hat{x}^*}$ is lower for the less liberal lower court, and (ii) the probability of review is (weakly) lower for that court given the same observable facts and actions. (b) If $\mathbf{x_L} > \mathbf{x_H}$ for both lower courts, then (i) the critical value $\mathbf{\hat{x}^*}$ is lower for the more conservative lower court, and (ii) the probability of review is (weakly) greater for that court given the same observable facts and actions.

Hypothesis 3 indicates that moving a lower court closer to the higher court expands the region in which cases escape review, a sensible result. Hypothesis 3 also indicates that if one estimates the probability of review as a function of observable facts and the ideological distance between the higher and lower court, then the coefficient on the distance between the two courts' ideologies should be positive. This hypothesis is new to the literature.

Hypothesis 4 (change in high court's preferences). (a) As the court becomes more conservative or more liberal, \hat{x}* moves in the same direction (e.g., if \hat{x}_H increases, then \hat{x}* increases). Consequently, (b) as the higher court becomes more conservative, cases from liberal lower courts become (weakly) more likely to be reviewed (controlling for observable facts), and cases from conservative lower courts become (weakly) less likely to be reviewed.

Hypothesis 4 is closely related to hypothesis 3 and also seems quite sensible, although it is new to the literature.

One of the most established facts about certiorari is that amicus briefs and the involvement of the Solicitor General greatly increase the probability the Supreme Court will accept a case. A complete analysis of those two factors would require modeling third-party signaling and is beyond our scope here. In a somewhat similar model, however, Banks and Weingast (1992) note that third-party signals can be seen as reducing auditing costs. The following hypothesis considers the effects of changes in the cost of review.

Hypothesis 5 (change in the cost of review). A decrease in the cost of review (a) increases x^* if $x_L < x_H$ and decreases x^* if $x_L > x_H$. Consequently, (b) the probability of review (weakly) increases, controlling for observable levels of intrusiveness.

This hypothesis offers one reason amicus briefs or involvement of the Solicitor General may increase the probability of certiorari: They reduce information costs for the Supreme Court.

Hypothesis 5 and the no-review equilibrium in part 1 of proposition 1 have an interesting implication. When the Supreme Court has little interest in a technically demanding area (such as admiralty or patent law), the value of k will be large, and the Court will largely or entirely abandon that area. For instance, during the last 50 years the Court has only rarely heard admiralty cases, once a substantial portion of its caseload. Conversely, when the Court has a substantial interest in a less technically demanding area (e.g., civil liberties), hypothesis 5 suggests it is likely to hear many such cases. The topic seems to act as a "cue" for the Court, though in fact the causal mechanism is not so much signaling as the magnitude of information costs relative to the possible gains from review. The importance of this type of cue is a recurrent finding in the literature.

EMPIRICAL ANALYSIS

Data

The data for this analysis were assembled as follows. As part of a larger project on circuit court decision making, we drew a random sample of U.S. Courts of Appeals search-and-seizure opinions (including per curiams) published in the Federal Reporter from 1961 through 1990. We determined the universe of these cases by searching Westlaw (www.westlaw.com) for all "searches and seizures," all Fourth Amendment cases, and criminal law topics 219, 226, 364, 394, and 207, plus relevant combinations of keywords. From this universe we then drew a random sample stratified by year, consisting of 40 cases per year. Any that were not in fact search-and-seizure cases were discarded and replaced with the next case from the universe. For years with less than 40 cases, all published cases were included in the sample.

The original sample of more than 1,100 published appeals court decisions yielded only 18 cases reviewed

⁶ Referring to Figure 1, it may seem plausible to strengthen hypothesis 2 so that the probability of review, if nonzero, is a constant with respect to observed facts. Yet, such a strengthening requires the additional assumption that ε is not only uncorrelated with the distance between the courts but also identical across all lower courts. Whether the probability of review, when positive, varies with respect to observable facts can be seen as a test of this rather strong assumption.

by the Supreme Court. This is not surprising, given the rarity of certiorari. Therefore, the next step was to add all other appeals court search-and-seizure cases reviewed by the high court. Such a sample, known as a choice-based sample, is commonly used when the event of interest is rare. Special statistical techniques are required for such samples, to which we return shortly.

Each case in the final sample was coded in various ways: whether the appeals court upheld or struck down the search, whether the case was appealed to the Supreme Court, whether certiorari was granted, and so on. We also coded fact patterns for each case using the procedures employed by Segal (1984). The identity and votes of each judge on the appellate court panel were also recorded. Using the identity information, appeals court judges were matched with data on their personal background and characteristics (see Songer, Segal, and Cameron 1994). Characteristics were unavailable for some, since often district court judges and retired judges sit as the third member of appellate court panels. Personal characteristics were available for the lead judge in most of the cases, however.

Our model indicates five key variables. The dependent variable is whether certiorari was granted (Grant). The independent variables are the signal, that is, whether the lower court admitted the evidence (Admit); an index, the publicly observable intrusiveness of the search (Intrude); another index, the ideology of the lower court (II); and the ideology of the Supreme Court.

Using the case facts, we constructed the measure of the publicly observable intrusiveness of the search in the following way. Segal (1984) estimates the likelihood the Supreme Court will uphold a search, based on the fact pattern in cases and a proxy for the ideology of the Court. In particular, Segal estimates weights on each variable using a logit regression. Since the Court's decision to uphold or strike down search-and-seizure cases depends partly on the intrusiveness involved, the logit weights on case facts provide a convenient way to measure intrusiveness. More specifically, we construct the variable intrude as follows:

$$Int = -3.256 \times Incident - 1.049 \times Afterlaw + .06$$

$$\times Unlawful - 1.928 \times Warrant + 3.25 \times Home$$

$$+ 2.054 \times Person + 2.733 \times Business + 2.243$$

$$\times Car - 1.411 \times Except + 1.766 \times Extent.$$

The definitions for the case fact variables are identical to those of Segal (1984), but we reverse the sign on the variables, as we wish to measure intrusiveness rather than lack of it. We also do not employ the constant or Segal's proxy for Supreme Court ideology, since we wish to measure intrusiveness rather than probability of upholding or reversing. Furthermore, we do not

employ Segal's variable Probcaus, which indicates whether the lower court found probable cause for the search. We argue that, for the most part, findings about probable cause do not reflect publicly observable facts but the private information the lower court obtained through its scrutiny of the case. It is exactly in its determination of probable cause that a lower court can try to exploit its informational advantage to alter the outcome of a search-and-seizure case in its preferred direction. It is worth noting that lower court determinations of probable cause do not affect the Supreme Court's decision on the merits, according to Segal's analysis (i.e., the coefficient on this variable was not statistically different from zero). This makes perfect sense from an informational standpoint: Once the Supreme Court has heard a case, it can make its ruling based on its own knowledge of previously unobservable facts, not what the lower court says about them.

We created a measure of the doctrinal preferences of the lower court in a two-step fashion, following Songer, Segal, and Cameron (1994).8 First, we regressed the votes of the appellate judges on their background characteristics (e.g., whether they were appointed by a Republican president or were a prosecutor before becoming a judge). The logit weights from this regression were used to form an index of conservatism for each judge for whom background information was available (low numbers on the index indicate a presumptively liberal judge; higher numbers a more conservative one).9 This is obviously far from perfect as a measure of doctrinal preferences. Nonetheless, presumptively conservative judges, based on simple background characteristics, tend to vote more often to uphold searches relative to presumptively liberal judges (Songer, Segal, and Cameron 1994). Hence, the index has a degree of face validity. Thus, the first stage yields a measure of ideology for each judge on the three-judge appellate panel.

The formal model assumes a single measure of ideology for a lower court, an abstraction adopted to simplify an already complex model. In the empirical analysis, however, we have to consider how the Supreme Court may determine the ideology of the lower court judges. Several possibilities present themselves. Most obviously, the Court may cue off the ideology of the opinion writer (measured by our variable *J1*); we explore this possibility below. Or the Court may try to judge the general ideological tenor of the lower court, perhaps best reflected in the mean ideology of the judges in the majority. Alternatively, the Court may use its limited information very efficiently, cueing off the

See Brace, Hall, and Langer 1998 and Giles, Hettinger, and Peppers 1998 for similar uses of regression-based techniques to impute judicial ideologies.

⁷ The following equation provides the mapping from fact space to attitude space discussed in the previous section. Whether this simple linear mapping is adequate to capture important doctrinal subtleties is an interesting question, but Segal's work demonstrates its empirical power.

⁹ The logit is 353 region -311 appointing president +381 religion +189 prosecutor +152 judicial experience, defined as: judge's region (1 = South, 0 = non-South), the appointing president's ideology (1 = liberal, 0 = moderate, -1 = conservative [Tate and Handberg 1991]), the judge's religion (1 = Catholic, 0 = other), prosecutorial experience (1 = yes, 0 = no), and judicial experience (1 = yes, 0 = no). A simple index based on the number of presumptively conservative traits works almost as well as the multivariate regression in predicting votes of appellate judges.

most liberal judge in the majority in conservative decisions and the most conservative judge in the majority in liberal decisions. Information about a dissenting judge, if any, also may be useful. Data limitations prevent a detailed analysis of these possibilities.¹⁰

We control for the doctrinal preferences of the Supreme Court in a simple way: We restrict our attention to the last three natural courts (courts in which there are no personnel changes) of the Burger years (Burger Courts 3-5 in Table 5-2 of Epstein et al. 1997). That is, we examine cases from January 7, 1972, to September 25, 1986—from the addition to the Court of William Rehnquist up to the addition of Antonin Scalia—which yields 273 usable appealed cases. During this period, in the arena of criminal justice the dominant coalition on the Court was relatively stable and quite conservative. Moreover, the bulk of the appellate court panels that the high court faced were almost certainly more liberal than the Supreme Court, at least with respect to search and seizure.11 This makes the detection of relevant patterns in the data much easier.

Method

Hypotheses. The data allow us to address hypotheses 1-3 in the signaling model. Since the Burger Court was almost certainly as conservative, if not more so, in search-and-seizure cases as most of the lower court panels it faced (Blasi 1983), the model predicts a series of patterns that are neatly captured in the conditioning plot shown in Figure 2. Such plots are powerful devices for detecting interactions or (as is relevant in this case) patterns across statistical regimes (Cleveland 1993). The plot is read in the following way. Each panel shows the relationship between the probability of granting certiorari and the intrusiveness of the search, under a specific condition. In the top two panels, the lower court admitted the evidence. In the bottom two panels, the lower court excluded the evidence. In the left-hand panels (top and bottom); the judge who wrote the opinion for the lower court was quite liberal. In the right-hand panels, the judge who wrote the opinion for the lower court was conservative (but, recall, less conservative than the Supreme Court).

The signaling model predicts several patterns when the data are arranged in this fashion (Figure 2). The

¹⁰ Because data on district court and retired judges sitting by designation were not available, more than one-third of our cases would have to be excluded if we were to use a composite measure of panel ideology. By focusing on the opinion writer, we cut missing data to below 10%. Moreover, it is not unrealistic to imagine that the Supreme Court cues off the opinion writer, especially as the justices' certiorari memos typically highlight his or her name.

top two panels should show a zero probability of review at all levels of intrusiveness: If the lower court took the conservative action, then the Burger Court should not review it (from hypothesis 1). The prediction for the lower panels is more complicated. Refer to the step function in the right-hand panel of Figure 1. The signaling model predicts such a step function in each of the lower panels of Figure 2, but it should be located farther to the right in the left-hand panel than in the right-hand panel (hypothesis 3.a.i.), and it may be beyond any level of intrusiveness actually observed. So, at any value of intrusiveness, the probability of review should be no greater in the lower right-hand panel than the lower left-hand panel (hypothesis 3.a.2). Finally, in the lower panels, if the probability of granting certiorari approaches zero, it should do so only for high levels of intrusiveness (hypothesis 2).

Choice-Based Sampling. The estimated models need to reflect the fact that the sample is choice based. This is easily done by weighting the observations (see Manski and Lerman 1977; Greene 1991, Section 36.5, provides a simple example). In the initial sample, the proportion of appealed cases actually heard by the Supreme Court was 5%. These were subsequently oversampled, so that they account for about 27% of the final sample. Consequently, cases granted appeal are overrepresented by .27/.05 = 5.4, and cases not granted review are underrepresented by .73/.95 = .77. To account for this, the granted cases need to be weighted by the factor .05/.27 = .19, and the rejected cases need to be weighted by the factor .95/.73 = 1.3. In all the models presented below, including the scatter plot smoothers, this procedure was followed.

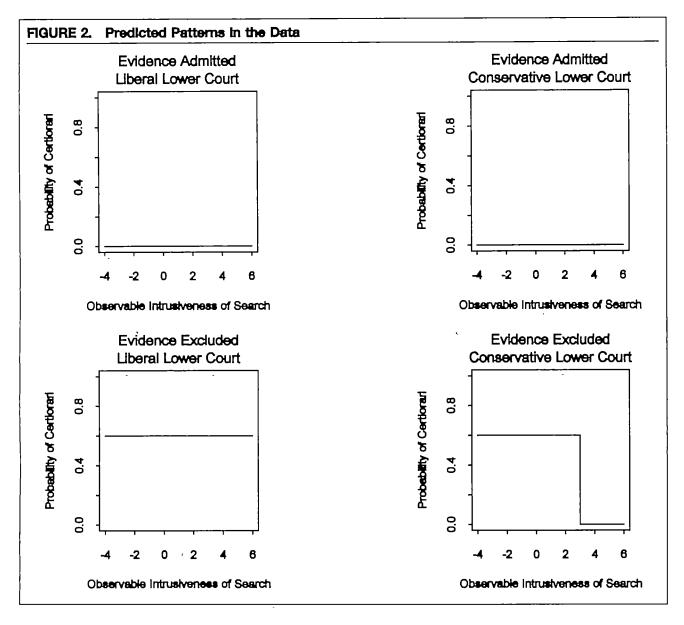

Data Display

Figure 3 displays all the data in the form of the critical conditioning plot. Liberal lower courts are defined as those whose ideology score (II) is at or below the median value (.152). To help uncover the systematic variation in the data without imposing any pattern ex ante, we include the fit from a nonparametric scatter plot smoother. The outstanding patterns in the data are clear, namely, the radical difference between cases in which the evidence was admitted (the top row) and those in which the evidence was excluded (the bottom row). In the former, the probability of review is zero, except at the very highest levels of intrusiveness, where it appears to increase slightly. In the latter, the probability of review is never near zero, except for very intrusive searches struck down by conservative courts.

Figure 3 uncovers another predicted pattern: The probability of granting certiorari as a function of intrusiveness is flat (or slightly increasing at high levels of intrusiveness) when the lower court admits the evidence; flat when liberal courts exclude the evidence;

¹¹ To test whether the Court's decisions remained stable under Chief Justice Burger, we added to the model dummy variables for each chief justice from Warren through Rehnquist (minus one for the excluded dummy) and an interaction for the presence of that chief justice and each passing term of the Court from 1962 through 1991. This, as we have previously shown, is the best measure of changing search-and-seizure doctrine between Courts. Nevertheless, if we look only within the Burger Court, we find that the coefficient for its interaction is 0.06, with a standard error of 0.05. Thus, we are reasonably confident in our assertion that under Burger, the Court's preferences remained stable.

¹² In each panel the smoothing curve is a locally weighted (loces) regression (span = 1) incorporating the Manski-Lerman weights. Other smoothers yield similar patterns, and the results are not particularly sensitive to the span of the regression. On these techniques, see Beck and Jackman 1998.

and strongly decreasing when conservative courts strike down a search. Finally, in the lower panels the estimated probabilities of granting certiorari—ranging from about 10% to more than 80%—are very high, in the context of known patterns about certiorari. For example, the overall probability of granting certiorari for search-and-seizure cases appealed to the Burger Court was 7%.¹³

Parametric Fitting: The Signaling Hypotheses

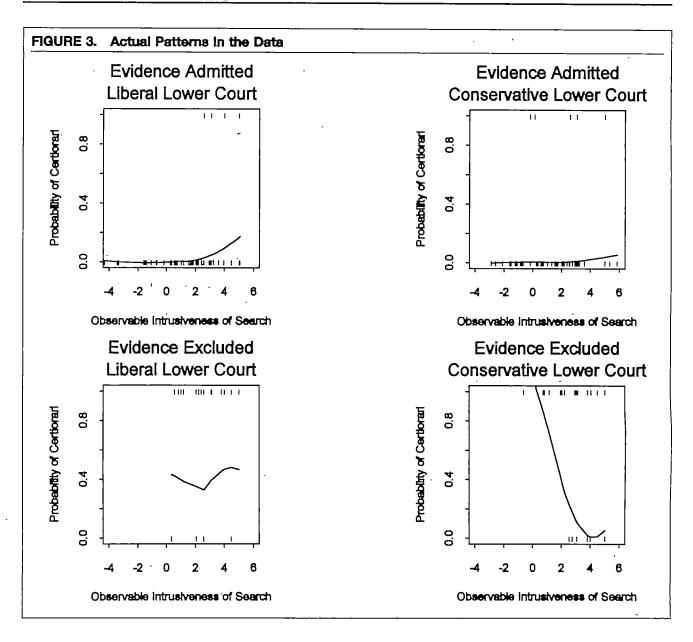

Bearing in mind that we model only one aspect of the certiorari process, Table 1 presents empirical tests of the theoretical model. As required by the theory, the statistical models are switching regime regressions (Goldfeld and Quandt 1973), which we estimate as logistic regressions. The regimes are the same shown in the critical conditioning plot in Figure 2. In models 1

and 2, the slope in the lower right-hand panel is estimated as a linear function of observed intrusiveness; in models 3 and 4 it is estimated as a step function.

In all four models, the coefficient on the variable admit is the intercept for cases in which the lower court admitted the evidence. Admit:intrude is the slope coefficient on the level of intrusiveness for the admitted cases. Across all four models, these variables have stable, statistically significant coefficients. It is straightforward to calculate the implied probabilities of granting certiorari, and these are shown in Figure 4 (using model 4). In the top two panels of that figure, the probability of the Supreme Court granting certiorari if the lower court admitted the evidence is essentially zero, except at the highest levels of intrusiveness, where it increases to about 15%.

The patterns predicted when the lower court excluded the evidence are more complex, and the models explore these patterns in some detail. In all four

Data compiled by the authors from U.S. Law Week.

models, the variable exclude is the intercept for cases in which the lower court excluded the evidence. In no model is this term statistically significantly different from zero, which indicates a baseline probability of granting certiorari for these cases of approximately 50%. Model 1 allows the slope on intrusiveness to vary linearly depending on the ideology of the lower court (as measured by JI, the ideology of the opinion writer). For liberal judges ($JI \leq .1$) the coefficient may take one value; for conservative ones (JI > .1) it may take another. As shown in Table 1, if the lower court was liberal, then the probability the Supreme Court would grant certiorari was not affected by the level of intrusiveness. But if the lower court was conservative, then the probability fell with the level of intrusiveness. ¹⁴

Model 2 is identical to model 1 but drops the statistically insignificant variable that allowed intrusiveness to affect the probability of certiorari for cases with evidence excluded by a liberal court. (The insignificance of this variable is compatible with the theory [see the lower left-hand panel in Figure 2].) Excluding this variable has only a very small effect on the overall fit of the model, as shown in Table 1 by the residual deviance. In model 2, the predicted behavior of the Supreme Court varies dramatically depending on the ideology of the lower court, given exclusion of the evidence. If the lower court was liberal $(J1 \le .1)$, then the predicted probability of granting certiorari was slightly more than 50% regardless of how intrusive the search. If the lower court was conservative (J1 > .1), then the probability declined dramatically with intru-

 $^{^{14}}$ Although our theoretical model explicitly calls for cut-points and regime changes, estimating the model with the original interval-level measurements for lower court ideology and the intrusiveness of the search does not change the results. Rerunning model 1 yields the following equation: .046 (1.08) - 6.56 (1.68) \times Upheld - 0.19

^(0.36) \times Intrude + 2.01 (2.23) \times Ideology + 1.13 (0.50) \times (Upheld \times Intrude) - 1.09 (0.71) \times (Ideology \times Intrude), with standard errors in parentheses.

Varlable Varlable	Model 1	Model 2	Model 3	Model 4

siveness, falling to less than 10% for very intrusive searches. 15

Models 3 and 4 more directly test the theoretical model by forcing the relationship in the lower right-hand panel of the conditioning plots in Figure 2 to take the form of a step function. We place the step at intrude = 1 (similar results obtain when the step is placed anywhere in the range 0-4). The step "down" from the intercept is given in Table 1. Model 3, like model 1, allows the probability of certiorari, given exclusion by a liberal lower court, to vary with the intrusiveness of the search. But as in model 1, this variable is not statistically significantly different from zero. Model 4 drops this term. Model 4 fits the data only negligibly worse than models 1 and 2 (residual deviance = 62.9).

The fit from model 4 is shown in Figure 4. As noted above, the predicted probability of granting certiorari for most upheld cases is zero and for liberal lower courts that excluded the evidence is about 50%. As shown in the lower left-hand panel of Figure 4, this constant probability can now be seen as the upper step in a step function. Among more conservative lower courts that excluded the evidence (the lower right-hand panel), the probability of review remains at about 50% for less intrusive searches (the upper step in the step function). For more intrusive searches, the probability falls to about 18% (the lower step in the step function).

Discussion

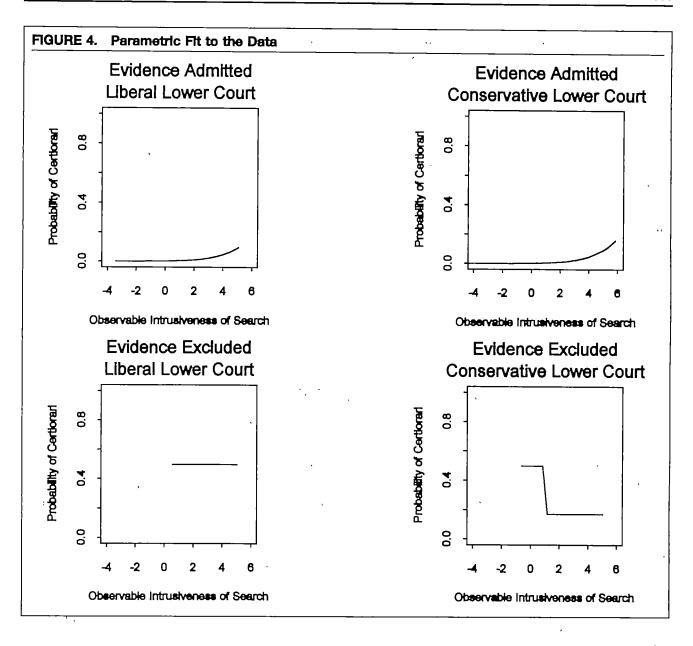

The patterns revealed by the statistical analysis and shown in Figure 4 strongly resemble those predicted by the signaling model. The dramatic difference between the top and bottom rows in the figure confirms the "Nixon goes to China principle." The more subtle predictions, involving the location of the step, are consistent with the lower panels.

Two discrepancies deserve brief discussion. First, among cases in which the lower court admitted the evidence, the probability of review rises slightly at the highest levels of intrusiveness. If some of the lower courts were more conservative than the Supreme Court, then the model predicts this should not completely escape review for very intrusive searches. The presence of some courts like this, or variables outside the model, could account for the slight increase in review probabilities at high levels of intrusiveness after admission of the evidence. Second, the lower step in the step function does not rest on zero but is located somewhat higher. If more liberal courts are mistakenly measured as less liberal, then this measurement error (as well as variables outside the model) could lead to an increase in the measured value for the lower step.

CONCLUSION

Our signaling theory of the Supreme Court's certiorari decisions was tested against a random sample of cases heard in the federal appellate courts. The theory is an incomplete view of the process: It emphasizes the role of certiorari in enforcing the doctrinal preferences of

¹⁵ The results are not sensitive to the exact location of the break between more liberal and less liberal lower courts, that is, the results are similar if the break falls anywhere between 0 and 3 on the ideology scale.

the Supreme Court throughout the judicial hierarchy but ignores its important role in the evolutionary creation of doctrine. The data are far from perfect. For example, we rely on fairly crude measures of judicial ideology and a relatively coarse coding of fact patterns in the cases. Despite these shortcomings, which ought to militate against finding patterns in the data, our analysis uncovers considerable support for the signaling theory as well as support for a variety of new propositions. Of course, we tested our model in only one area of decision making during the reign of one chief justice. Whether the data fit the model in other areas and during other regimes remains to be seen.

Our research makes three contributions. First, we use a formal model to advance our substantive understanding of certiorari. Most of the patterns uncovered here are new, despite the extensive research on the subject. We believe it unlikely that an analyst would uncover the patterns shown in figures 3 and 4 without a formal signaling model. Second, the research inte-

grates the study of the judicial hierarchy with the "new economics of organization" (Moe 1984). The application of formal principal-agent theory to the judicial hierarchy yields several benefits, both within the field of judicial politics and, more broadly, for the study of political hierarchies. Within the field of judicial politics, two phenomena, hitherto regarded as distinct, emerge as two components of a single underlying process that can be analyzed in a unified way. The two phenomena are judicial compliance (the responsiveness of lower courts to changes in the doctrinal directives of higher courts) and certiorari; both can be treated as interactive components in a political struggle over doctrine within the judicial hierarchy. From this perspective, the problem of doctrinal control in the judiciary is not sui generis but a particularly interesting case of an issue common to rule-governed hierarchies. To underscore the point, our model of strategic auditing, although tailored to the certiorari process, has broader applicability to other hierarchical settings in

which players have political preferences about rules. Third, the research provides empirical support for a formal model, which is still in relatively short supply.

APPENDIX

Proof of Proposition 1

Part 1 (2* does not exist). Note that the case deals with $\begin{array}{lll} F(t_b) - F(t_a)/1 - F(t_a) < k \ \forall \ \pounds. \ F(t_b) - F(t_a)/1 - F(t_b) > k \ \forall \ \pounds. \ \text{cannot arise because } \lim_{t \to \infty} F(t_b) - F(t_a)/1 - F(t_a) = 0. \ \text{This is true because } t_a, t_b \to -\infty \text{ as } \pounds \to \infty. \ \text{Thus, } F(t_a), F(t_b) \to 0 \text{ and } 1 - F(t_a) \to 1 \text{ as } \pounds \to \infty, \end{array}$ and the quotient goes to zero. For any nonzero k there must exist a sufficiently large \hat{x} so that $F(t_b) - F(t_a)/1 - F(t_a) < 0$ k. (A) Existence. If H does not review any cases, then the indicated strategy for L is clearly a best response. By assumption, $F(t_b) - F(t_a)/1 - F(t_a) < k \ \forall \ \hat{x} \ \text{when } s(t, \hat{x}) = 1 \ \forall \ x \in [x_L, x_H)$. Then, from equation 2, $r(exclude, \hat{x}) = 0$ $\forall \hat{x}$. That $r(admit; \hat{x}) = 0 \ \forall \hat{x}$ is discussed in the text. (B) Uniqueness. There are three cases to consider, none of which can be an equilibrium. (1) The indicated strategy for L, but H reviews at least one case with probability greater than zero. By construction, H can profitably deviate to the indicated strategy. (2) The indicated strategy for H, but L deviates in some fashion from deciding cases according to its preferred rule. Then there are cases where L can profitably deviate to the indicated strategy. (3) H reviews some cases with probability greater than zero, and L deviates from deciding cases according to its preferred rule for at least one case in the conflict region (i.e., $\exists x \in [x_L, x_H)$ s.t. $s(t, \hat{x}) < 1$) (deviations from the indicated strategy for L are never profitable for cases below x_L or above x_H [inclusive] and need not be considered further). By construction, the Bayesian posterior $\mu(x_L \le x \le x_H, exclude, \hat{x}) < k$ when $s(t, \hat{x}) = 1$ $\forall x \in [x_L, x_H)$. But $\mu(x_L \le x \le x_H, exclude, \hat{x})$ decreases when $s(t, \hat{x}) < 1$ for some x in the conflict region. Thus, $\mu(x_L \le x \le x_H, exclude, \hat{x})$ remains less than k when s(t, t) \hat{x}) < 1 for some x in the conflict region, and therefore H can profitably deviate to the strategy indicated in the proposition.

Part 2 ($\mathbf{\hat{x}}^*$ exists). By inspection, the strategies characterized in part 2 comprise best responses: $s^*(t, \hat{x})$ is compatible with $BR_L(r(m; \hat{x}), t; \hat{x})$, and $r^*(m_i, \hat{x})$ is compatible with equation 2 and the requirement that $r(m_2, \hat{x}) = 0 \ \forall \hat{x}$ (the latter is explained in the text). Q.E.D.

Proof of Hypotheses 1 and 2

Follows immediately from proposition 1. Q.E.D.

Proof of Hypothesis 3

(a) We consider the case in which $x_L < x_H$; via symmetry, similar arguments apply when $x_L > x_H$. Recall that \hat{x}^* is defined implicitly by equation 3. The partial derivative of equation 3 with respect to \hat{x}^* is

$$\frac{f(t_a)(1-F(t_b))-f(t_b)(1-F(t_a))}{(F(t_a)-F(t_b))^2}\frac{k}{1-k},$$

which will be nonzero provided

$$\frac{f(t_a)}{1-F(t_a)} \neq \frac{f(t_b)}{1-F(t_b)},$$

that is, the hazard rate at t_a is not equal to the hazard rate at t_b . A necessary condition for this is that $x_L \neq x_H$, which will also be sufficient provided F displays the monotone hazard

rate property (MHRP) (under MHRP, if t' > t, then the hazard rate at t' is greater than the hazard rate at t), as assumed. Then, via the implicit function theorem,

$$\frac{\mathrm{d} \hat{x}^*}{\mathrm{d} x_L} = -\frac{\mathrm{d} s}{\mathrm{d} x_L} \bigg/ \frac{\mathrm{d} s}{\mathrm{d} \hat{x}^*} = \frac{f(t_a)[1-F(t_b)]}{f(t_a)[1-F(t_b)]-f(t_b)[1-F(t_a)]} \,.$$

The numerator is positive. From the definitions of t_a and t_b , $x_H > x_L \Rightarrow t_b > t_a$, which, using MHRP, in turn implies the denominator is negative. (b) is obvious given (a). Q.E.D.

Proof of Hypothesis 4

The argument is similar to that of hypothesis 3. Again considering the case in which $x_L < x_H$, via the implicit function theorem,

$$\frac{\mathrm{d}\hat{x}^*}{\mathrm{d}x_H} = -\frac{\mathrm{d}s}{\mathrm{d}x_H} / \frac{\mathrm{d}s}{\mathrm{d}\hat{x}^*} = \frac{f(t_b)[1 - F(t_a)]}{f(t_b)[1 - F(t_a)] - f(t_b)[1 - F(t_b)]} > 0$$

using MHRP. The other case follows via symmetry. Q.E.D.

Proof of Hypothesis 5

As in hypotheses 4 and 5. For $x_L < x_H$

$$\frac{\partial \hat{x}^*}{\partial k} = -\frac{\partial s}{\partial k} / \frac{\partial s}{\partial \hat{x}^*}$$

$$= \frac{\left[1 - F(t_a)\right] \left[F(t_b) - F(t_a)\right]}{-f(t_a)\left[1 - F(t_b)\right] - f(t_b)\left[k(1 - k) + F(t_a)\right]} < 0,$$

as the denominator is negative (provided $0 < k \le 1$), and the numerator is positive. The other case follows from symmetry. Q.E.D.

Presidential Pork: Executive Veto Power and Distributive Politics

NOLAN M. McCARTY Columbia University

It is often argued that executive powers such as the veto serve to reduce particularistic spending by the legislature. I argue that the effect of the executive veto depends strongly on assumptions about both the nature of executive preferences and the institutional structure of executive-legislative bargaining. To support these claims, I develop a model of distributive policymaking subject to an executive veto. This framework incorporates variation in presidential objectives and formal powers into a dynamic bargaining model. In equilibrium, stronger veto power leads to a lower level of distributive spending, but the effects are mitigated to the extent that the president prefers spending in some districts over others. The model also generates new insights and predictions about fiscal policy under the separation of powers, including the effects of divided government, electoral rules, and term limitations for the executive.

major but largely open question in the study of American political institutions is the extent and nature of presidential influence in the legislative process. There is considerable debate as to both how much legislative power the president can assert and the processes and mechanisms by which it comes about. While it is often colorful and convenient to refer to the president as the legislator-in-chief or the third house of the legislature, there are obviously important differences between the roles of the legislators and the president.

First, there are large differences in electoral constituencies. Whereas legislators come from plurality elections in small districts, presidents are elected in national elections. A sequential set of primaries, diverse delegate selection rules, and the electoral college further complicate the president's coalition building. These differences certainly affect the preferences and goals that each brings to legislative bargaining. Second, the formal rules of the legislative process differentiate between legislators and presidents. Because presidents cannot formally introduce bills, their legislative powers such as the veto are primarily reactive. Any influence, therefore, usually must come through the legislature's strategic anticipation of the use of these prerogatives.

However important these distinctions between legislators and executives may be, very few models fully incorporate both issues. As I argue below, much of the literature makes rather stylized assumptions about the induced preferences of the president and the executive-legislative bargaining environment. In this article, I develop a new model of executive-legislative bargaining that allows both variation in the links between the president and his constituents as well as variation in his formal legislative powers. In combining both features, the model can address important issues concerning the relationships among presidential preferences, formal powers, and policy outcomes.

My model differs from previous work on the president's role in fiscal policy in two fundamental ways. First, it allows the chief executive to have preferences over the distribution of spending across districts. Rather than specify a particular source (electoral, legislative, or partisan) of these preferences, the model assumes only that the president wishes to maximize the net spending in a subset of districts, or his *constituency*.

Second, the model differs in the way it approaches the legislative bargaining process. Whereas much of the literature assumes that Congress makes a single take-it-or-leave-it offer to the president to alter an exogenous status quo or reversion, I relax this assumption by employing a sequential choice model of the legislative process and interbranch bargaining based on the work of Baron and Ferejohn (1989a), Harrington (1990), and Baron (1991). The sequential choice model developed here is an infinitely repeated, noncooperative game that focuses on the effects of presidential veto power on legislative proposals and voting. The model preserves the legislative monopoly over agenda control, but it allows the bargaining to take place over time rather than at a single moment. In the dynamic model, the agents no longer bargain in the shadow of an exogenous status quo but in view of endogenous expectations of future legislative decisions and presidential vetoes. These equilibrium expectations about proposals subsequent to presidential vetoes work to give the chief executive a greater degree of leverage than in a single-shot game.

I relax the common assumption that legislative proposals are generated from a single proposer, generally the median legislator. This assumption is often defended on grounds that the legislative decision-making process will generate median voter outcomes. In a purely distributive setting, however, median voter theorems carry little weight because the set of feasible allocations is multidimensional.²

Nolan M. McCarty is Assistant Professor of Political Science, Columbia University, New York, NY 10025.

I am grateful to Charles Cameron, John Huber, John Matsusaka, David Park, and seminar participants at Columbia and Stanford universities for useful comments.

¹ A complete review of this literature would take us far afield. Book-length studies that focus on these questions include Bond and Fleisher 1990, Cameron n.d., and Edwards 1980.

² Significant work on the role of vetoes and supermajority override in multidimensional settings includes Hammond and Miller 1987 and Tsebelm 1994, which focus on the "core," that is, the set of policies that cannot be overturned by any decisive coalitions. Veto institutions are analyzed for their effects on the set of decisive coalitions and, therefore, the set of stable policies. Accordingly, this work concentrates on policy stability, legislative production, and "solving" majority rule cycling. The implications of executive veto power on

In the sequential choice model, these problems are handled by assuming that proposals are made sequentially according to a recognition rule. If the recognition rule contains some randomness, there will be uncertainty about which majority legislative coalitions will form subsequent to a presidential veto. This uncertainty gives the president a degree of leverage over the proposals of the current legislative majority.

REPRESENTATION, VETOES, AND PRESIDENTIAL INFLUENCE ON FISCAL POLICY

In previous models of the budgetary process, legislators often are assumed to behave so as to maximize net expenditure within their own electoral district. Such an assumption has a great deal of analytical power. Because it is easy to accept the link between budgetary success and the reelection of the incumbent, the analyst is free to proceed to more interesting questions, such as those regarding the collective ability of legislative bodies to control spending. When the role of the president in distributive politics has been studied, however, the reelection motive has been applied in exactly the same fashion: The president will seek to maximize the net benefits going to his electoral district. Since that district is the entire nation, the president is typically viewed as a counterweight to the distributive politics of the legislature (Carter and Schap 1987; Dearden and Husted 1990; Fitts and Inman 1992; Inman 1993; Lohmann and O'Halloran 1994). Therefore, it is assumed that the president uses his veto power (or other powers) to maximize the welfare of his entire constituency. In this literature, institutions such as the executive veto serve to thwart the tendencies of a legislature that is biased toward particularistic benefits for its members, at the expense of more general interests. Based on the assumption of presidential universalism, this literature puts forward strong normative arguments for increasing executive power in the legislative process. Among these proposals are the line-item veto and other reforms that move budgetary decision making from the legislative to the executive branch.3

Yet, there are reasons to be suspicious of the assumption of presidential universalism when applied to budgetary politics. It is not obvious that the simple strategy of ensuring budgetary efficiency accords as nicely with his reelection (or even history book) incen-

distributive politics has not yet been addressed. Banks and Duggan (1998) show that when a core exists, the stationary equilibrium to a sequential choice model is "close" to it, so that the game theoretic and the social choice frameworks are complementary.

tives as do other possible strategies. There are many reasons the president may not act to maximize the social welfare. The first and perhaps most important is electoral politics. Much of the previous literature assumes that the president is an agent of his entire constituency, but his electoral constituency is likely to be more important in determining his preferences over appropriation outcomes. In principle, he may try either to reward regions that provided support in his election or to direct resources to strategic "swing" regions to enhance his reelection prospects (or those of his party). Consistent with this view, Grier, McDonald, and Tollison (1995) find that the president's decision to veto a bill can be predicted by the votes of senators from electorally important states. Mebane and Wawro (1996) also find support for the proposition that the president specifically targets spending toward areas that are important for his reelection. These results suggest that the chief executive may use the veto and other perquisites of his office to favor some districts over others.

A second source of particularistic preferences of the president is the desire to direct distributive benefits to certain legislators in order to further his legislative agenda. It has long been recognized that the president often promotes his agenda by influencing individual legislators or "buying votes" (see Groseclose 1996; Groseclose and Snyder 1996; Snyder 1991). Discussions of such favor giving are usually limited, however, to the president's campaigning for members of Congress or Rose Garden photo opportunities. His role in allocating spending across districts has not received as much attention.⁴

Finally, the president may act on partisan motivations. As the leader of his party, he may feel pressure to favor legislative districts controlled by members of his own party. Empirically, this is borne out by Levitt and Snyder (1995), who find that districts represented by Democratic representatives fared much better in terms of federal spending during the Carter administration than they did during the Reagan years.

The problems associated with mischaracterizing presidential motives may be minimal if the institutional constraints are well specified. Yet, many rational choice models of the presidency use highly stylized representations of the legislative process, which may confound the problems alluded to above. In many treatments, the legislature is modeled as a monopoly agenda setter that proposes legislation subject to an executive veto (Carter and Schap 1987; Ferejohn and Shipan 1990; Kiewiet and McCubbins 1988). These models and others in the literature on agenda control typically predict only a limited role for the president in the process. Veto power in these models, to the extent that it influences legislative output at all, only permits the president to ensure that policies he desires less than the status quo are not enacted.

In terms of the budgetary process, Kiewiet and

³ Carter and Schap (1987) and Dearden and Husted (1990) demonstrate theoretically that, even when the president deares lower budgets than Congress, line-item vetoes may not lower expenditure below that associated with an all-or-nothing veto. This counterintuitive effect is the result of antiations where the line-item veto forces the legislature to increase expenditure on the executive's budget priorities more than enough to compensate for the reduction in spending on its priorities. This may explain weak empirical results about the effect of line-item vetoes in reducing expenditure in the states (Alm and Evers 1991, Holtz-Eakin 1988).

⁴ Lohmann and O'Halloran (1994) consider the effects of delegation to the president, who prefers to distribute favors to members of his own party.

McCubbins (1988) argue that the effects of the veto on the overall budget are asymmetrical. If the reversionary appropriations are lower than the desired budget of the legislature and the president, then the effect of veto power will be to lower spending only if the president prefers a lower budget than the legislature. It has no effect when the president prefers a larger budget than the legislature. By demonstrating the inability of the president to increase budgetary items, these theoretical results and the empirical support provided by Kiewiet and McCubbins are inconsistent with a large role of the executive in the budgetary process.5 Even models of asymmetric information, which may allow the president to achieve outcomes that he prefers to the status quo (Cameron and Elmes 1994; Matthews 1989; McCarty 1997), do not go very far in establishing the theoretical basis for a large role for the president in legislative decision making.

If there is a common implication of these behavioral and institutional assumptions, it is that they both predict the net effect of executive veto power is to lower expenditure. The behavioral assumption suggests that the executive will always prefer lower budgets, while the agenda control assumption produces lower spending because veto power will be ineffective in increasing it, except in rare circumstances.⁶

In the next section, I develop a model that captures the effects of variation in both the president's formal veto powers and his induced preferences over spending outcomes. The model finds that veto power constrains legislative spending, but the extent of this effect depends strongly on the president's preferences for universalistic outcomes over particularistic ones. Furthermore, the efficiency effects of the veto often come at the cost of spending inequities across districts.

A MODEL OF DISTRIBUTIVE POLITICS AND THE VETO

To focus on the role of executive veto power in altering the dynamics and outcomes of legislation on spending, consider an appropriations bill that distributes the benefits of a project with a total value of B among N districts. The tax cost of the project, T, will be distributed evenly among all districts so that each must pay T/N. A legislative proposal is simply a division of the benefits among the N districts, or $\mathbf{x} = \{x_1, \ldots, x_N\}$,

such that $\sum_{i=1}^{N} x_i \leq B$. The final allocation of these benefits will be determined by majority rule subject to an executive veto and supermajority override.

An important parameter in the analysis will be the benefit-cost ratio, R = B/T. Programs for which $R \ge 1$ will be called *efficient*; those for which R < 1 are termed *inefficient* because the benefits fail to exceed the costs. My evaluation of executive veto institutions will be based primarily on their effect on the passage of inefficient programs. Therefore, my results focus on the programs with the smallest benefit-cost ratio that are able to pass through the legislative process. This critical value will be referred to as the *minimally efficient* benefit-cost ratio, R^* . In addition to providing a measure of welfare, R^* is inversely related to spending levels because, for a given set of possible programs, fewer pass when R^* is high. As I demonstrate below, this value will be a function of both the president's veto power and the breadth of his coalition.

Rather than arbitrarily limit the opportunities for legislative consideration of this project, following Baron (1991), I assume that the legislature may consider the passage of the project for an infinite number of periods within a legislative session or term. I interpret this indefiniteness as a product of uncertainty about the time of the final period rather than as a truly infinite game. If the project does not pass in a given period, it may be taken up again in the future. Each legislator discounts future payoffs by 8, so that legislator i's payoffs are $8'u(x_i - T/N)$, where t is the time period in which the agreement passes, and $u(\cdot)$ is a utility function over net spending.

In order to investigate the role of the executive veto, the preferences of the president over the distribution of expenditure must be taken into account. I assume that he wishes to maximize the utility of his constituency, M, where m is the number of districts in M. Thus, the president wishes to maximize $\sum_{i \in M} \delta^i u(x_i - T/N)$. Because some concavity is necessary to give the president preferences over the distribution within his constituency, the model assumes that

$$u(r) = \begin{cases} \lambda r & \text{if } r \ge 0 \\ r & \text{if } r < 0 \end{cases}, \tag{1}$$

where $\lambda < 1$. Therefore, the marginal utility of spending is greatest when the district is receiving negative net benefits. This (weakly) decreasing marginal utility ensures that $u(\cdot)$ is concave.⁸ If the appropriation never passes, the payoff is u(0) = 0. The weak concavity of

⁵ Furthermore, any presidential influence on budgetary outcomes in the Kiewiet and McCubbins (1988) model depends crucially on the assumption that a continuing resolution at previous spending levels is enacted after a veto. If the relevant reversion is the statutory reversion of \$0, however, their model predicts that the budgetary outcome will only reflect legislative preferences. My model shows that the norm of continuing resolutions at previous spending levels is not a necessary condition for the executive to have influence over budgetary outcomes.

⁶ Conditions in the Kiewiet and McCubbins (1988) model imply that the veto power limits the ability of Congress to cut spending. This occurs when Congress wishes to reduce spending below the previous year's nominal level, but the president does not agree to the extent of the cuts. In the years studied by Kiewiet and McCubbins, due to inflation (which turns nominal freezes into real cuts) and the political climate for larger government, this scenario was rare. In the current climate, the situation is more plausible.

⁷ The choice of an infinite horizon rather than a long but finite horizon can be justified on several grounds. Osborne and Rubenstein (1994, 135) argue that "a model with an infinite horizon is appropriate if after each period the players believe that the game will continue for an additional period, while a model with a finite horizon is appropriate if the players clearly perceive a well-defined final period." Since my model focuses on bargaining over the course of a legislative term, uncertainty about the exact date of adjournment precludes such a well-defined final period. Furthermore, even if the exact end of the legislative term is known, it may be so distant in the horizon that it does not factor explicitly into the agents' calculations (Osborne and Rubenstein 1994).

Gilligan and Krehbiel (1995) use a similar utility function in the context of a sequential choice model.

 $u(\cdot)$ suggests that the president cares about the distribution of spending within his constituency, since his utility can be raised by taking a dollar from a constituency district receiving positive net benefits and giving it to one receiving negative net benefits. My model treats the choice of the constituency as exogenous in order to focus most of the attention on the implications of particularistic preferences regardless of their source.

As shown by Baron (1991), the possibilities for passage of the project and the distributional consequences are affected by the choice of legislative rules and recognition procedures.9 This analysis, however, considers the case of legislative bargaining under the closed rule with uniform random recognition, as proposed by Baron. In that case, proposer i is chosen with uniform probability 1/N in each period. 10 She subsequently makes a proposal. The legislature votes by majority rule, so that when N is odd, n = (N + 1)/2votes are needed for passage; if N is even, n = (N +2)/2 votes are required. The proposal is then submitted to the president for signature or veto. If he signs it, then the appropriations are made, each district is assessed an equal share of the taxes, and the game ends. If he vetoes it, the legislature may override with k > n votes.¹¹ In the event that the legislature is unable to override the veto, the session ends, and each legislator discounts the future at a rate of 8.12 An important consideration in deciding whether to vote for the proposal is the utility of defeating it and continuing to the next period. Let v_{ith} be the expected utility player i receives for defeating a proposal at time t with history of play h. This expected utility of the future will be referred to as the continuation value. These values will be determined in equilibrium.

Following Baron and Ferejohn (1989a), only stationary and symmetric strategies are considered. Stationary strategies are time and history independent.¹³ In this context, stationarity implies that proposals will only be

⁹ In fact, given that the model is an N-dimensional voting game, the mere existence of a solution will depend on there being at least minimal legislative structure to overcome the well-known voting cycle problem.

a function of the identity of the proposer as well as the basic parameters m, k, N, and δ . Symmetry is imposed so that proposers treat all legislators of the same type identically. Since the only ex ante differentiation of legislators in this model is based on membership in the president's constituency, the stationarity and symmetry assumptions suggest that strategies will depend only on whether the proposer is a member of the president's constituency. Thus, the continuation values, v_i , and optimal proposals of each legislator depend only on her constituency status. Let $v_i = v_p$ for members of the presidential constituency, and let $v_i = v$ for nonmembers. The stationarity assumption also implies that these are the ex ante expected utilities of the game. Much of the analysis will concern the relationship of v_p to v.14 In order to examine the role of the president, one must consider his continuation value, because it will determine his veto strategies. Stationarity and symmetry imply that the president's continuation value

Given a set of continuation values, voting and vetoing strategies are straightforward. A legislator (president) will reject (veto) any proposal for which the
utility is less than that person's discounted continuation
value. It is interesting to note that the continuation
values play the same role as the expected utility of the
reversion policy in other legislative bargaining models,
such as those based on Romer and Rosenthal (1978).
Unlike the reversion in most agenda control models,
however, continuation values are not exogenous; they
are derived from rational expectations of future legislative outcomes.

Given the strategies for all legislators and the president, consider the strategies of the proposers. A proposer must choose whether to make any proposal and, if so, how to allocate funds across districts. If she chooses to make a proposal, her problem is to formulate one that is capable of generating a coalition sufficient to pass the bill while keeping as much of the program's benefits as possible for herself. Let z_p and z be the net benefits retained by constituency and nonconstituency proposers, respectively. To maximize these benefits, she must choose the winning coalition that commands the smallest share of the benefits. Conditional on making a proposal, there are two types of strategy the proposer may employ. The bill must satisfy either the president and a simple majority of n members or a supermajority of k members. For simplicity, I refer to "n + the president" as the majority strategy and a coalition of k members as the override strategy. Since mixed strategies over these coalitions may be necessary (see Banks and Duggan 1998), let π_p and π be the probabilities that each type of proposer pursues the override strategy. If neither of these strategies leaves the proposer with enough benefits to compensate for her own taxes, a proposal will not be made. Such nonproposals occur when $B/T < R^*$, where this critical ratio will be determined by the parameters of the game.

¹⁰ While random recognition does not mimic any actual procedures of a legislature, it is a useful device for capturing the inherent uncertainty that legislators face in building distributive coalitions. Random recognition is a way of modeling the fact that legislators do not know exactly which coalitions will form in the future if the current coalition fails to enact the legislation. The assumption of uniform recognition probabilities is relaxed in a later section.

¹¹ Note that an override rule of $k \le n$ is superfluous, as any group of legislators large enough to pass the bill is also large enough to override. I will consider the case of an absolute veto for which no override is possible, that is, k > N.

¹² Baron and Ferejohn (1989a, 1989b) interpret 8 not only as the discounting of future costs and benefits but also as the probability that the legislator is returned to office. Since the bargaming in this model is assumed to take place within a legislative session, however, it is better to interpret 8 as a combination of time discounting and an exogenous probability that the legislative session terminates, rather than as a reelection probability.

¹³ Baron and Ferejohn (1989a) show that any division can be supported in nonstationary equilibria using infinitely nested punishment strategies. Baron and Kalai (1993) argue that stationarity is an attractive restriction because the fewest computations are required by the agents in the model, and therefore it adds an additional element of empirical plausibility.

¹⁴ I also take advantage of symmetry to suppress the superscript ℓ and stationarity to suppress the subscripts ℓ and h on x_{th}^{ℓ} and x_{th}^{ℓ} .

For my sequential choice model, a symmetric, stationary Nash equilibrium will constitute values of z_p , z, v, v_p , π , and π_p that are consistent with each player maximizing her utility, given the strategies of other players. I am particularly interested in the effect of veto rules and constituency size on the efficiency of programs that pass (R^*) and the distribution of expenditure across districts $(v_p$ and v). Is I will present these values for all the cases I discuss below. A more formal statement of the model and proofs of all the results are given in the Appendix.

Having described the model, I now discuss the results for the two important benchmark cases: no executive veto and a universalistic president.

No Executive Veto

In the case of no executive veto, presidential constituents and nonconstituents become ex ante identical because they have identical legislative prerogatives. Since all legislators have the same continuation values, a proposer can choose any simple majority from the legislature to receive benefits. A proposal will pass so long as the proposer can keep enough benefits after satisfying a majority to compensate for her district's share of the taxes. Column 1 of Table 1 presents the critical benefit-cost ratios and continuation values for this case, which is identical to the analysis of Baron (1991) for the closed rule in a majoritarian legislature. (The column headings and other material in Table 1 are explained as the cases are considered.)

As in Baron's analysis, R* defines a critical ratio of benefits to costs that must be exceeded in order for the program to be passed. As R* is bounded above by n/N < 1, some inefficient programs will be passed in addition to all the efficient programs. The inefficient programs pass because legislators will vote for those in which they receive negative net benefits since they rationally anticipate the possibility of receiving an even worse distribution of net benefits in future periods in which they are not selected by the proposer. Given these rational expectations, they vote for a bill that makes them worse off than they would be if the bill did not pass. An interesting implication of this result is the effect of the discount factor on R^* . The size of the minimally efficient program decreases as legislators weigh the future more heavily. In other words, the more they fear bad future outcomes, the more likely they are to accept bad current ones.

This case also has implications for the size of government when no executive veto is available. Given a fixed menu of possible government projects, more projects will pass as R^* diminishes. This will lead to more government spending than the optimal level, as projects unjustified on cost-benefit grounds will be enacted, which is the key result of Baron (1991). The

¹⁵ Because the continuation values at R^* define R^* , I present the values of ν_p and ν at R^* . This reduces notation and facilitates companisons across cases.

tendency of majority rule to lead to inefficiently large government is a robust theoretical result. Overspending is generated in models by Tullock (1959), Weingast, Shepsle, and Johnsen (1981), and others. The reason is that the majority does not internalize the costs it imposes on the minority. The sequential choice model reveals that both the minority and the majority (except the proposer) are made worse off by some of the proposals that pass.

Universalistic Presidents

One argument prominent in the literature on the executive role in budgetary politics is that the president can limit inefficient legislative logrolls and thus the size of government (Inman 1993). These analyses typically assume that the president is a universalist; that is, he seeks to maximize the net benefit of all districts. Given that objective, he can use the veto to prevent excessive spending. In the current model, this argument corresponds to the case in which the president's constituency is composed of the entire legislature, or m = N.

In this case, to avoid a veto the total utility of the president's constituency must exceed $N\delta v_p$. To override a veto, k legislators must receive utilities of δv_p . Since $k \leq N$, proposers have an incentive to build override coalitions. Since k > n, a larger coalition is involved than in the "no veto" case. The critical benefit-cost ratio and the continuation values for the universalistic case are given in column 2 of Table 1.

Even under universalism, inefficient programs may pass, as R^* is bounded from above by k/N. Only in the case of an absolute veto (k = N) does the critical ratio reach the efficient value of one. Since k > n, however, Table 1 shows that the critical value for the universalistic president with a veto must be higher than the one for no veto. By forcing proposers to build larger winning coalitions, the executive veto eliminates some of the inefficient programs that would be enacted in its absence. Furthermore, the effectiveness of the veto in limiting spending increases in accord with the number of votes required for override. The lowest possible benefit-cost ratio approaches unity as k goes to N. This analysis again suggests a normative rationale for stronger veto provisions. Intuitively, the veto power increases the efficiency of the level of government expenditure because, as the president cares about the payoffs to each district, all benefits must be shared more equitably. When the benefits are spread over more districts, it becomes somewhat less attractive to implement costly programs. Yet, as I show below, if the president wishes to use the veto to favor particular districts, benefits may not be spread more equitably as veto power increases via an increase in k. In turn, this effect will undermine the beneficial effects of the veto.

¹⁶ Baron (1991) finds that legislative inefficiency is smaller under an open rule, which allows proposals to be amended, and Krehbiel

⁽¹⁹⁹²⁾ finds empirically that open rules are more likely for distributive legislation. Future research will examine the relationship of the executive veto to the choice of legislative rules.

Critical Ratios and	•	Universalistic	Particularistic (Absolute

PARTICULARISTIC PRESIDENTS

checount factor.

To analyze the effect of a president with nonuniversalistic preferences, I now consider the model for the case in which 0 < m < N. As an example to motivate the more general results, I will focus on $k \ge N$, so that the president has an absolute veto. The results are presented in columns 3 and 4 of Table 1.

Under an absolute veto, a majority coalition is the only feasible route, and the president must receive utility of at least $m\delta v_P$ for the proposal to pass. Successful proposers must allocate the benefits so that this constraint will be satisfied while also satisfying enough other members to create a majority. Including members of the president's constituency helps generate presidential support as well as form a majority for passage. Therefore, each constituency member has a much higher probability of receiving benefits than does a nonmember. Proposers within the president's constituency also fare better than nonmembers because the net benefits they keep for themselves increase the president's utility. Thus, fewer resources must be allocated to other districts in order to avoid a veto. Both these effects increase the expected utility of presidential constituents, so that $\nu_p > \nu$. The extent of this effect can be seen in columns 3 and 4 of Table 1. Because the president's allies are advantaged, his resolve to combat inefficient programs via the veto is diminished, which reduces the critical ratio required for passage.

Comparing the critical ratios of this case with those of the "no veto" case, I find that the absolute veto is more efficient than pure majority voting for all values of m. The president's desire to favor some districts over others does not completely undermine the effects of the veto. The intuition is clear. Under pure majority rule, all members expect negative benefits from an inefficient program. Therefore, the primary consequence of using the veto to favor some districts is to block inefficient programs, but this effect is clearly stronger when the president wants to favor more districts. In both columns 3 and 4 the critical benefit-cost ratio is increasing in m. Therefore, the larger the president's constituency, the smaller is the number of inefficient programs that pass.

For a more general set of results, the assumption that k > N is relaxed to consider the role of the veto override. Now proposers must determine whether to pursue a majority or an override coalition. Note that when m is much larger than k, this decision is irrelevant. The proposer will always build an override coalition, and the outcome is identical to the case of a universalistic president, discussed above. Alternatively, when m is reasonably small, the proposer will always choose to satisfy the president and a simple majority. In this case, the results are identical to the case of an absolute veto.

In general, however, it will not be an equilibrium for the proposer to choose either type of bill with certainty. If the proposer has a clear preference for the override proposal, then the continuation values of the president's constituents will tend to be reduced. Alternatively, if the proposer prefers a proposal acceptable to the president, then the continuation values of those outside his constituency will diminish. In equilibrium, this "bidding process" ends only when the proposer is indifferent between proposing to the majority coalition or to a size k coalition. Given this indifference, each proposer will play a mixed strategy, so that π and π_p may be strictly between 0 and 1.17

The solution to this more general model involves a number of cases that depend on the values of m, k, and n. For each case, the solution of a system of equations constitutes a symmetric, stationary Nash equilibrium. The systems of equations that generate a solution to this game are relegated to the Appendix. Since the equilibrium expressions involved in the case of a qualified veto and a nonuniversal constituency turn out to be very complicated and not very informative, I present a numerical computation to demonstrate the effects of both presidential constituency size and override rules on the size of budgets. Figure 1 plots the critical benefit-cost ratios for a 400-member legislature with a discount rate of .9 as a function of m and k.

Figure 1 demonstrates that inefficiency diminishes with an increase in both the size of the president's constituency and the number of votes required for an override. Perhaps more surprising is that for any m and k > n, inefficiency and spending are lower with a presidential veto than without it. The logic behind these results is straightforward, as the positive effects of constituency size and veto power are combined. The enhanced veto power increases the president's ability to shield his constituency from inefficient programs; at the same time, it gives proposers an incentive to build override coalitions to defeat a veto. This spreads the benefits across a greater number of districts and lowers the benefit of an inefficient program to the proposer. This result conforms to the conventional wisdom that executive veto power may well place a break on distributive spending. Yet, the result depends neither on universalistic preferences nor the placement of an exogenous reversion. Any constraint on the proposer's ability to play each district against another in the formation of a coalition will inhibit inefficient spending. Particularistic presidents are not sufficient to eliminate the beneficial effect of veto power.

The effect of increasing the president's constituency size is also apparent. A larger m will force proposers to spread the benefits across more districts and will lower the amount they can retain for themselves. Larger presidential constituencies also lessen the ability and

desire of the president to redistribute. Both influences tend to lower the critical benefit-cost ratio.

The previous discussion can be summarized as follows.

Result Summary 1. In the case of particularistic presidents,

- 1. the degree of inefficiency and the level of spending decrease when the president has a large constituency and veto powers.
- 2. the degree of inefficiency and the level of spending are lower than in the case of no executive veto, regardless of the size of the president's constituency and his veto powers.
- 3. the degree of inefficiency and the level of spending are higher than when the president is a universalist, given any level of veto power.
- 4. veto powers are effective in allocating spending toward districts favored by the president.

SUPERMAJORITARIANISM AND THE EXECUTIVE VETO

Although it appears that the veto is an effective constraint on legislative logrolls, it does not fare very well in comparison to alternatives such as supermajoritarian procedures. A model of legislative decision making under a k-majority rule is identical to the no veto case if n = k. This model generates the same benefit-cost ratio as the case of a universalistic executive veto with a k-vote override (column 2 of Table 1). Given the results of the previous section, it is easily shown that in terms of efficiency this k-majority rule dominates a k-veto institution. Furthermore, supermajoritarianism does not lead to the inequitable distribution of resources induced by the veto. These results suggest that budgetary reforms of internal legislative procedures may well be more desirable than those that involve enhancement of executive power.

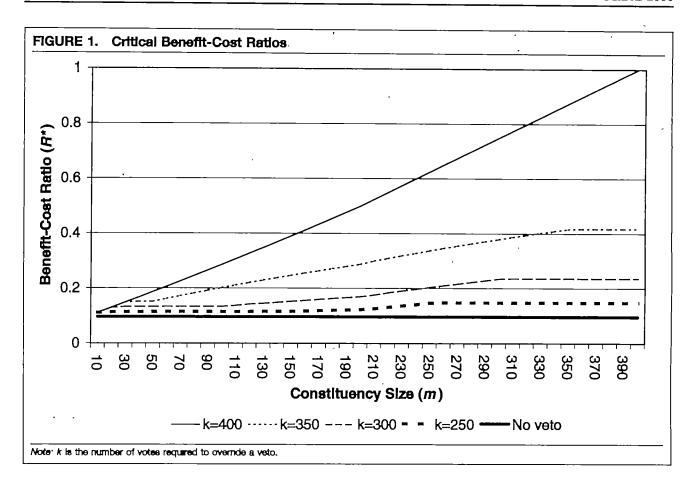

Result Summary 2. Bargaining under a k-majority

- 1. produces outcomes identical to a universalistic president subject to a k-vote override.
- performs better than a particularistic president subject to a k-vote override in terms of efficiency and spending.
- is more egalitarian than presidential veto power with a k-vote override because it does not skew results toward the president's constituents.

PARTISANSHIP AND DIVIDED GOVERNMENT

Until this point, the role of the president's constituency has been discussed in rather abstract terms. Empirically, however, it is likely that the president's constituency will coincide with membership in his party. If so, the results of my model suggest testable connections between distributive spending and the size of the president's party in the legislature. When it is small

¹⁷ These probabilities should not be interpreted as the likelihood of a veto occurring. If the president knows that his veto will be overridden, then he will have no incentive to execute it. In fact, vetoes never occur in equilibrium. Therefore, the framework should not be viewed as a model of vetoes per se but as a model of the effect that the existence of the veto institution has on the distribution and level of expenditure. The empirical content of π and π_p is the probability distribution of winning coalition sizes.

(such as divided government), spending should be more distributive than when it is stronger (unified government). This prediction, however, is based on a dubious assumption.

To this point, the model has assumed that the recognition probabilities are uniform and do not depend on a legislator's status in the president's constituency. If that constituency is partisan, however, then the ability of the majority party to exert disproportionate control over the legislative agenda may lead to recognition probabilities that are a function of a member's status vis-à-vis the president. Suppose there is divided government and the minority (president's) party is recognized to make proposals with probability zero. This may inhibit the president's ability to redirect benefits to his party members and thus upset the prediction that divided governments engage in more distributive spending. Again, such logic turns out to be false.

To explore the possible effect of partisan differences in recognition probabilities, let q/m be the probability that a member of the president's party is recognized, and let (1-q)/(N-m) be the probability that an opposition party member is recognized. An interpretation of these probabilities is that the president's party is chosen to make a proposal with probability q, while the actual proposer is drawn uniformly from the party's members.

The previous results for uniform recognition repre-

sent the case of q = m/N. This is the relevant benchmark for a weak party system. Now consider the case of a strong party system, where q = 1 if $m \ge n$, and q = 0 if m < n. The weak party model refers to the case of uniform proposal power. These results are identical to columns 3 and 4 of Table 1. For simplicity, columns 6 and 7 refer only to the case of an absolute veto.

In column 6, while the veto power without proposal power may not allow the president's party to share in the positive benefits of an efficient program, the negative power of the veto prevents the president's party from having to share in the costs of an inefficient program. This also serves to limit the inefficiency of enacted programs. Thus, even when the president's party has no proposal power, the veto may constrain the distributive choices of the legislature.

When the president's party is in the majority (column 7), one might suspect that the veto would help the majority further exploit the minority and increase distributive spending. My results show this is not the case, because the primary role of the veto is to prevent members of the majority from exploiting one another.

This result also underscores that veto power is more important for efficiency and spending than is the allocation of proposal powers. In the case of m > n, the critical values are identical across the cases (columns 4 and 7). When m < n, the strong party

legislature performs better, but the effect is quite small. For example, if N = 400, then the maximum difference across all values of m and δ between the critical values of columns 3 and 6 is about .003.

Thus, a strong partisan legislature does not contradict the implication of a correlation between divided government and distributive spending. McCubbins (1991) presents evidence of such a correlation for appropriations to 69 federal agencies from 1948 to 1985, and Lohmann and O'Halloran (1994) find a correlation between trade protection—a quintessential distributive policy—and divided government.

Result Summary 3. In terms of spending and efficiency, the strong party legislature performs only slightly better than the weak party legislature. The predictions about divided government are robust to assumptions about party control of the legislative agenda.

CONCLUSION

This article has presented a model of the influence of the executive veto on legislative spending decisions. In contrast to previous work, it focuses not only on how the veto may affect the overall level of spending but also on the distribution of spending across political jurisdictions. The results indicate that the veto may have quite large effects on the distribution of spending even when the executive chooses to favor small constituencies. Furthermore, the concentration of benefits to the presidential constituency does indeed serve to limit spending rather than increase it. For this reason, augmenting the power of the executive, regardless of his parochial or political interests, may move distributive spending toward the efficient level.

The model has many normative implications for the design of legislative and electoral institutions. With regard to legislative processes, it argues strongly for executive veto provisions in terms of efficiency but shows that such institutions will have large distributive effects. Control over the distribution of spending may give the executive a large bargaining advantage in other policy areas. This effect will certainly tend to inhibit reforms, such as an increase in the number of votes needed to override. In contrast, reforms of electoral institutions may have the same desirable effects without the distributional consequences. For example, the electoral college system may encourage presidential parochialism, as votes in some legislative jurisdictions are more important than in others.¹⁸ The presidential primary system tends to place weight on early and winner-take-all contests. The logic of my model suggests that unweighted electoral schemes or national primaries may minimize the incentive to favor one district over another.

The results also speak to a current debate in the comparative literature on presidentialism. Many schol-

ars have noted the especially dire consequences of presidentialism (relative to parliamentarism) when the president's party in the legislature is small (see Jones 1995; Linz 1994; Shugart and Carey 1995). My model predicts that such situations will also be characterized by a much higher level of distributive spending. Perhaps most important, spending will be heavily skewed toward the party of the president, perhaps further exacerbating underlying economic inequality. Since Shugart and Carey (1995) and Jones (1995) find evidence that certain electoral institutions are more likely to produce presidents with legislative minorities, the model suggests a strong interaction between electoral and legislative procedures in the production of fiscal policies.

In addition to the normative implications, a number of testable hypotheses emerge from this model. The first is that one might expect the president to use the veto to favor electorally important districts or legislative allies. Grier, McDonald, and Tollison (1995) and Mebane and Wawro (1996) have supported the hypothesis that the president uses the veto to favor election constituencies. The second is that patterns of spending across states should reflect electoral and/or legislative support for the president. Finally, there may be a relationship between the breadth of the president's constituency and the size of government.

Again, if one uses political party as a proxy for the president's constituency, the model suggests that government should grow faster during periods of divided government because the president's constituency is smaller. This implication could also be tested on data at the state level, which would provide not only cross-sectional variation in divided versus unified governments but also variation in the types of executive veto institutions, including the line-item veto. In the same vein, the model could be quite useful in explaining fiscal policy outcomes in other presidential democracies. These data would provide much more variation in presidential and legislative electoral institutions, party systems, and executive powers.

Finally, the model may be able to explain behavioral differences between presidents in their first as compared to second term. Since the lame duck has somewhat less proximate electoral concerns, he may have fewer parochial preferences and may attempt to maximize the utility of a greater set of districts. In turn, the model implies that fewer inefficient projects would pass, leading to lower government spending in the second term relative to the first. ¹⁹ This effect may help explain why there are more executive than legislative term limitations (Carey 1996).

¹⁸ Brams (1978) and Colantoni, Levesque, and Ordeshook (1975) analyze the effect of the electoral college on the allocation of campaign resources.

¹⁹ An alternative would be to give the second-term president a lower discount factor than legislators because of the reduced importance of the future. While a complete analysis of such a model is beyond the scope of this article, my intuition is that the implication would be the same as that of a larger constituency. As in the case of the individual legislator, a lower discount factor suggests that fears of future inefficient programs would not sufficiently intimidate the president into accepting a current one, which also eliminates inefficient programs.

APPENDIX

Formal Description of Model

Strategies. Let $X = \{x | \sum_{i=1}^{N} x_i \le B\}$ and $\Delta(X)$ be the set of probability distributions over it. A (behavioral) strategy for proposer i at time t and with history h is given by $\sigma_{ith} \in \Delta(X)$. Stationarity requires that $\sigma_{ith} = \sigma_i$ for all t and h. Symmetry implies that $\sigma_i = \sigma_p$ if $i \in M$, and $\sigma_i = \sigma$ otherwise. A (behavioral) strategy for a legislator i in the voting stage is given by $A_{ith}(x) \in \{0, 1\}$, where $A_{ith} = 1$ corresponds to a vote in favor, and $A_{ith} = 0$ a vote against. Similarly, stationarity requires that $A_{ith} = A_i$ for all t and h. Symmetry requires that $A_i = A_p$ if $i \in M$, and $A_i = A$ otherwise. Let $P_{th}(x) \in \{0, 1\}$ be the strategy of the president, $P_{th} = 1$ corresponds to signing the bill, and $P_{th} = 0$ implies a veto. $P_{th} = P$ for all t and h. A proposal x passes if $\sum_{i=1}^{N} A_i(x) \ge k$ or if $\sum_{i=1}^{N} A_i(x) \ge n$ and P(x) = 1.

Payoff. The utility functions are described in the text. Let v_{tth} be the expected utility of beginning the subgame of time t and history h. Stationarity and symmetry imply that $v_{tth} = v_p$ if $t \in M$, and v otherwise.

Solving the Model

Presidential Veto Stage. P(x) = 1 if and only if $\sum_{i=1}^{m} u(x_i - T/N) \ge \delta m \nu_P$. This implies acceptance when $\sum_{i=1}^{m} x_i \ge m(\delta \nu_P + T/N)$ if $\nu_i < 0$, or $\sum_{i=1}^{m} x_i \ge m(\delta \nu_P/\lambda + T/N)$ if $\nu_i \ge 0$.

Legislative Voting Stage. $A_i(x) = 1$ if and only if $u(x_i - T/N) > \delta v_i$. Thus, she accepts if $x_i \ge \delta v_i + T/N$ if $v_i < 0$, or $x_i \ge \delta v_i / \lambda + T/N$ if $v_i \ge 0$.

Proposal Stage. Let X_n be the set of proposals from player i, such that $\sum_{i=1}^{N} A_i(x) \geq n$ and P(x) = 1, and let X_k be those such that $\sum_{i=1}^{N} A_i(x) \geq k$. Therefore, the costs to the proposer of proposal $x \in X_k \cup X_n$ are $c(x) = \sum x_{\sim i} + T/N$. Any proposal $x \notin X_k \cup X_n$ fails, and the bargaining continues. If proposer i chooses $x \in X_k \cup X_n$, she keeps $z_i = B - c(x)$ and her payoffs are $u(z_i)$. If the proposer chooses $x \notin X_k \cup X_n$, her payoffs are δv_i . Let $X_k \subseteq X_k$ and $X_n \subseteq X_n$ be the lowest cost proposals for both of these sets. Thus, the best acceptable proposal solves $\max_{x \in X_k \cup X_n} u(B - c(x))$. If this optimal utility level is less than δv_i , the proposer chooses $x \notin X_k \cup X_n$.

I now turn to characterizing X_n^* and X_k^* . Given the best responses of legislators, these sets can be characterized by the number of constituency members and nonmembers for whom A=1. Let $\mu_p^{in}=\sum A_p(x)$ and $\mu^{in}=\sum A(x)$ for $x\in X_n^*$, and let $\mu_p^{ik}=\sum A_p(x)$ and $\mu^{ik}=\sum A(x)$ for $x\in X_n^*$. Clearly, $\mu_p^{in}+\mu^{ik}\geq n$ and $\mu_p^{ik}+\mu^{ik}\geq k$. Assuming symmetry, all the numbers are the same across members and nonmembers, so that all the X_n^* and X_n^* sets can be characterized by $\{\mu_p^{pn}, \mu_p^{pk}, \mu_p^{pn}, \mu_p^{pn$

LEMMA 1: $v_p \ge v$.

Since by lemma 1 constituency members have higher continuation values, all the minimal-cost winning coalitions will include the minimum number of constituency members necessary to satisfy the president. So first consider $i \notin M$. All elements of X_n^* are cost equivalent to selecting $\mu_p^n = m$ constituency members and $\mu^n = \max\{0, n - m - 1\}$ nonmembers, whereas the elements of X_k^* require the votes of $\mu^k = \min\{k - 1, N - m - 1\}$ nonmembers and $\mu_p^k = \max\{0, k + m - N\}$ members. For $i \in M$, any benefits retained by the proposer raise the president's utility, so

elements X_n^* do not require satisfying all m members of M. Furthermore, since the president's utility function is concave, the extraordinary benefits of the proposer have a lower marginal utility than benefits given to those left out of the winning coalition. Therefore, to satisfy the president, a constituency proposer may have to reallocate money to members who vote against the proposal. Let d be the amount of reallocated money. Without loss of generality, I assume that d is divided equally among those who choose $A_p = 1$. Such an additional allocation is unnecessary for nonconstituency proposers since they may always divide benefits equally among M.

Thus, proposals from members of M may take the following form.

- 1. Distribute benefits to generate the support of $\mu_p^{pn} = j$ members and $\mu_p^{pn} = \max\{0, n-j-1\}$ nonmembers.
- 2. Divide d units of the benefits among the m-j-1 remaining members so that $\sum_{i=1}^{m} u(x_i T/N) \ge \delta m v_P$ is satisfied. The fact that these remaining members have a higher marginal utility for the benefits than does the proposer serves to raise the president's utility.

The proposer will choose j and d to minimize costs. The set of override proposals is similar to that of nonmembers: X_k^{ro} requires support of $\mu^{pk} = \min\{k-1, N-m\}$ nonmembers and $\mu_p^{pk} = \max\{0, k+m-N-1\}$ members.

To generate symmetric equilibria, I assume that each proposer randomizes uniformly within X_n^* and X_k^* . If a proposer is indifferent between the elements of X_n^* and X_k^* , then she chooses an element of X_k^* with probability π_i . Therefore, the expected number of members of group l selected by a proposer of type l is $\pi_i \mu_l^{lk} + (1 - \pi_l) \mu_l^{ln}$. Given X_n^* , X_k^* , and π_l , one can compute the probability that legislator l receives $u^{-1}(\delta v_l) + T/N$ and therefore chooses $A_l = 1$. This probability is denoted ϕ_l^l . Due to the symmetry assumptions, there are only four possible values $-\phi_p^p$, ϕ_p , ϕ_p^p , and ϕ —corresponding to whether $i, l \in M$. Simple calculations show that $\phi_p^p = [\pi_p \mu_p^{pk} + (1 - \pi_p) \mu_p^{pn}]/(m - 1)$, $\phi^p = [\pi_p \mu_p^{pk} + (1 - \pi_p) \mu_p^{pn}]/(m - 1)$.

These strategies lead to the following expression for the net benefits of proposing:

$$\begin{split} z_p &= B - (m-1) \varphi_p^p u^{-1} (\delta v_p) - (N-m) \varphi^p u^{-1} (\delta v) \\ &- ((m-1) \varphi_p^p + (N-m) \varphi^p) \frac{T}{N} - (1-\pi_p) d; \\ z &= B - m \varphi_p u^{-1} (\delta v_p) - (N-m-1) \varphi u^{-1} (\delta v) \end{split}$$
 (A-1)

$$= B - m\phi_{p}u^{-1}(\delta v_{p}) - (N - m - 1)\phi u^{-1}(\delta v)$$

$$- (m\phi_{p} + (N - m - 1)\phi)\frac{T}{N}.$$
 (A-2)

The expressions for the continuation values are

$$v_{p} = \frac{1}{N} \left(u(z_{p}) + ((m-1)\phi_{p}^{p} + (N-m)\phi_{p}) \left(\delta v_{p} + \frac{T}{N} \right) + (1 - \phi_{p}^{p})u(d) \right) - \frac{T}{N}; \tag{A-3}$$

$$v = \frac{1}{N} \left(u(z) + (m\phi^p + (N-m-1)\phi) \left(\delta v + \frac{T}{N} \right) \right) - \frac{T}{N}.$$
(A-4)

The solution to the model requires solving equations A-1-A-4 for z, z_p , v_p , v, j, d, π , and π_p as a function of the

TABLE A-1.	Parameters for Equations	A-1-A-4

parameters. The parameters ϕ_p^p , ϕ_p , ϕ_p^p , and ϕ are given in Table A-1 for the three relevant cases.

Additional equations are provided by indifference conditions for mixed strategies. To play mixed strategies, proposers must be indifferent between the override and the majority proposals. Since a constituency proposer always gets to keep more benefits in a majority proposal than does a nonconstituency proposer, it is impossible to have an equilibrium in which both types play mixed strategies. The only possibilities for mixed strategy equilibria are $\pi_p = 0$, $0 < \pi < 1$, and $0 < \pi_p < 1$, $\pi = 1$. It can also be shown that if m < n there are no equilibria for which $\pi = 1$ (this proof is tedious and not instructively valuable). This leaves the three cases listed in Table A-2. The condition that proposers who mix must be indifferent leads to an additional equation of the following general form:

$$\alpha \nu_P - \beta \nu - \gamma \frac{T}{N} = 0, \qquad (A-5)$$

where α , β , and γ are all nonnegative functions of the model's parameters. Table A-2 gives the values of α , β , and γ for each of the cases of mixed strategy equilibria.

Solutions are generated by solving a system of six equations for z, z_p , v_p , v, π , and π_p as a function of d and j and then choosing d and j to maximize z_p . The solutions are unique up to some choices of d and j. This fact is of minor concern, since z, z_p , v_p , and v are the main objects of analysis.

Proof of No Veto Case (Column 1): The case of no legislative veto is identical to m=0. Thus, override coalitions are unnecessary, and every successful proposal requires only n votes. Therefore, $\pi=0$, $\mu^n=n-1$, and $\phi=(n-1)/(N-1)$. To generate the lowest possible benefit-cost ratio for a successful program, I focus on the case of the solution in which $\nu<0$ (recall $z>\delta\nu$ for a successful program). Plugging these values into equations A-2 and A-4, I obtain $z=B-(n-1)\delta\nu-n(T/N)$ and $\nu=N^{-1}(\lambda z+(n-1)\delta\nu-(N-n)T/N)$. Solving these equations generates $z^*=[(N-\delta(n-1))B+(n-\delta(n-1))T/N]$

1)n/N]/[$N + \delta(\lambda - 1)(n - 1)$]. There is a continuum of stationary, symmetric Nash equilibria such that a proposal is made if and only if $z^* \geq \xi$, where $0 \geq \xi \geq \delta \nu$. Following Baron (1991), I focus only on those in which a proposal is made if $z^* \geq 0$. By stationarity, if this condition holds in any period, it will hold in all periods, including the first. Therefore, in equilibrium a proposal will pass either in the first period or not at all. From the expression for z^* , a proposal will be made and passed in the first period if and only if $B/T \geq R^* = [n - \delta(n-1)]/[N - \delta(n-1)]$. Q.E.D.

Proof of Presidential Universalism Case (Column 2): In the case of a universalistic president, it is always cheaper to satisfy k members than the president. Therefore, $\pi_p = 1$, $\mu_p^{pk} = k-1$, and $\phi = (k-1)/(N-1)$. Again focusing on $v_p < 0$, equations A-1 and A-3 generate $z_p = B - (k-1)\delta v_p - k(T/N)$ and $v_p = N^{-1}(\lambda z_p + (k-1)\delta v_p - (N-k)T/N)$. Solving these equations generally, $z_p^* = [(N-\delta(k-1))B + (k-\delta(k-1))T]/[N+\delta(\lambda-1)(k-1)]$ and $v_p^* = [\lambda B - (1+(\lambda-1)k/N)T]/[N+\delta(\lambda-1)(k-1)]$. Focusing on the same equilibrium as in benchmark 1, I find that a proposal will be made and passed if and only if $B/T \ge R^* = [k-\delta(k-1)]/[N-\delta(k-1)]$. Q.E.D.

Proof of Particularistic President Case (Columns 3 and 4): The minimally efficient benefit-cost ratio R^* must solve $z_p=0$ and equations A-1-A-4 above. It is easy to show that when $z_p=0$, z<0, v<0, and $v_p<0$. Since overrides are not possible, $\pi_p=\pi=0$. Each reference to equations A-1-A-4 assumes the substitution of the appropriate parameters from Table A-1.

Column 3. m < n: To avoid vetoes, proposals must also satisfy

$$\lambda z_P + j \delta v_P - (m - j - 1) \frac{T}{N} + d \ge m \delta v_P. \quad (A-6)$$

Given that $z_p = 0$, satisfying equation A-6 requires $d \ge (m-j)\delta v_p + (m-j-1)T/N$. Either this condition must bind, or d = 0. Otherwise, a constituency proposer could keep more benefits. If d = 0, then we claim $j^* = m - 1$. If

TABL	TABLE A-2. Parameters for Indifference Conditions							
	$m < N - k + 1$ $1 > \pi > 0$	$N - k + 1 \le m < n - 1$ 1 > π > 0	$m \ge n-1$ $1 > \pi > 0$	$m \ge n - 1$ 1 > π_p > 0, π = 1				
α γ β	m (k − n)/δ m + k − n	N – k (k – n)/ð N – n	N − k (k − m − 1)/δ N − m − 1	N + J - m - k + 1 $(k - n)/\delta$ N + J - m - n + 1				
Note: av	$\gamma_{\rho} - \beta v - \gamma (T/N) = 0.$							

not, then the condition implies that $v_P < -(m-j-1)/\delta(m-j)$, whereas equation A-3 would imply $v_P = -(m-j-1)/[N-\delta N+\delta(m-j)]$, which is a contradiction, since $N > \delta N$. Since either the veto constraint must bind or $j^* = m-1$, equation A-3 becomes $v_P = \delta v_P$, which implies that $v_P = 0$ at the minimally efficient proposal. Substituting $v_P = 0$ into equation A-2, we find that equations A-2 and A-1 imply that $z = \delta v$. Substitution into equation A-4 yields $v = -(N-\kappa-1)T/(N-\delta\kappa-\delta)N$, where $\kappa = m([n-j-1]/[N-m]) + N-m-1$. Substituting z_P, v_P , and v into equation A-1 gives $R^* = [n(N-\delta\kappa-\delta) - \delta(n-j-1)(N-\kappa-1)]/(N-\delta\kappa-\delta)$. This is a decreasing function of j, so that the minimum is obtained when j = m-1. Substitution of κ and κ leads to κ = $[n(N-m)-\delta N(n-m)]/[N(N-m-\delta(n-m))]$, which leads to $v = -(N-n)T/[N(N-m-\delta(n-m))]$.

Column 4. m > n: At $z_p = 0$, using arguments similar to those above, equation A-5 must be a binding constraint with d>0. As above, $\nu_p=0$. I now claim that at the minimally efficient program $j^*=n-1$. Suppose not. Then the constituency proposer could lower d by T/N by replacing one nonconstituency member with a constituency member and still satisfy the veto constraint at a cost of $\delta v_p - \delta v = -\delta v$. Since v > -T/N, this deviation pays for the proposer. Thus, at R^* , $j^* = n - 1$. Given these results, equations A-1 and A-5 imply that B - m(T/N) = 0, so that $R^* = m/N$. Note, however, that from inspection of equations A-2 and A-4 a nonconstituency proposer would not make this proposal, as it implies z = v = -T/N, so that $z < \delta v$. At this critical value only members of M make proposals that pass, while nonmembers make proposals that fail (or none at all). Thus, in periods in which a nonmember is chosen, every member's payoff is the discounted continuation value. This implies that $v = -mT/[N(N-\delta(N-m))].$

Proof of Partisan Veto Model (columns 6 and 7):

Column 6. If m < n and q = 0, then all proposers are nonconstituency members who must allocate $m(\delta v_P + T/N)$ to M to avoid a presidential veto. Thus, each constituency member receives benefits with certainty, so that $v_P = \delta v_P$ and $v_P = 0$. This implies $z = B - \delta(n - m - 1)v - n(T/N)$ and $v = [z + (n - m - 1)\delta v - (N - n)T/N]/(N - m)$. Since the minimally efficient program is the one in which z = 0, we have $v = -(N - n)T/[N(N - m - \delta(n - m - 1))]$ and $B - [n - [\delta(n - m - 1)(N - n)]/[N - m - \delta(n - m - 1)]]T/N = 0$. This leads to $R^* = [(n/N)(N - m) - \delta(n - m - 1)]/[N - m - \delta(n - m - 1)]$.

Column 7. If m > n and q = 1, a nonmember can never be a proposer. Therefore, $v = [(n - j - 1)\delta v - (N - m - n + j + 1)(T/N)]/(N - m)$. Using an identical argument as in the proof of column 4, it can be established that $j^* = n - 1$, and the veto constraint binds with d > 0. Since $j^* = n - 1$, v = -T/N. The continuation value for a member of M is $v_P = [z_P + c + j\delta v_P + (m - j - 1)(T/N)]/m$. Yet, since $z_p = 0$, and $d = (m - j)\delta v_P + (m - j - 1)(T/N)$ at the minimally efficient program, this reduces to $v_p = 0$. Finally, inserting $v_p = 0$ and $j^* = n - 1$ to equation A-1, I get B - m(T/N) = 0, so that $R^* = m/N$.

Issues, Economics, and the Dynamics of Multiparty Elections: The British 1987 General Election

R. MICHAEL ALVAREZ California Institute of Technology JONATHAN NAGLER University of California, Riverside SHAUN BOWLER University of California, Riverside

Te offer a model of multiparty elections that combines voters' retrospective economic evaluations with consideration of parties' issue positions and the issue preferences of voters. We show that both policy issues and the state of the economy matter in British elections. In 1987 voters made a largely retrospective evaluation of the Conservatives based on economic performance; those who rejected the Conservative Party chose between Labour and Alliance based on issue positions. Through simulations we move the parties in the issue space and reestimate vote shares as well as hypothesize an alternative distribution of views on the economy, and we show that Labour had virtually no chance to win with a centrist party as a viable alternative. The predictions from our 1987 simulations are supported in an analysis of the 1992 British election. We argue for multinomial probit in studying three-party elections because it allows for a richer formulation of politics than do competing methods.

There are at least two theories of voter choice in multiparty elections. The first emphasizes retrospective voting, that is, the incumbent party is evaluated based on economic performance during the recent past. The second emphasizes prospective voting based on issue evaluations of each party. These are complementary theories because each alone may be inadequate to explain voter decisions in a multiparty setting. The retrospective model cannot explain how voters choose between competing nonincumbent parties if they decide to vote against the incumbent, but the prospective issue voting model does not allow voters to punish or reward the incumbent party for economic performance. In this article we offer a framework that integrates and tests both theories. To test them we need to measure voters' views of the economy and of the parties' positions on the issues.

We use the 1987 British general election to test our model for several reasons. First, it has been studied by other researchers, and we want to show how our new methods affect previous scholarship. Second, it was an important event in the evolution of party politics in Britain. It marked the beginning of a rightward shift by

Statistical analyses presented here were carried out with Gauss Version 3.2.43 and GausaX Version 3.6.

Labour, and we want to explore whether a further moderation in 1987 could have won them the election. The 1987 contest also presaged later developments in party politics; the Social Democrat Party (SDP), who had only recently broken off from the Labour Party, ran with the Liberals as the Alliance. British voters were offered relatively clear rightist (Conservative), centrist (Alliance), and leftist (Labour) choices. Finally, the 1987 election took place during an economic boom and was the last in which Margaret Thatcher led the Conservative Party.

Our model of multiparty elections in Britain combines retrospective economic evaluations with the relative positions of the parties and voters in the issue space. The model allows voters simultaneously to evaluate all three parties-Conservatives, Labour, and the Alliance—rather than limit their choices to pairs of parties, as is usually done. We show that policy issues and the state of the national economy both mattered in the 1987 general election. Voters made a retrospective evaluation of the Conservatives based on economic performance, and those who rejected the Conservative Party chose between Labour and the Alliance based on issue positions. By simulating issue and economic effects on the election, we show that Labour had virtually no chance to win with the Alliance in the race. Even without the presence of a third party, Labour would have needed to moderate its policy positions to compete seriously with the Conservatives. Using the 1992 British election as an important out-of-sample test for our 1987 results, we find support for our predictions. In conclusion, we will argue that our multinomial probit method is a superior approach for studying multiparty elections, as it allows for a richer formulation of politics than do competing methods.

THE BRITISH CASE

First we will determine how retrospective voting operates in a three-party race. We will show that past economic performance influenced whether an individ-

ual voted for the incumbent Conservatives, but we also will show that economic considerations played little role in voter evaluations of the nonincumbent parties. Second, we will look at prospective issue voting in multiparty elections in a new way: We examine (1) how parties can influence their vote share by moving in the issue space with the existing configuration of parties and (2) how the Conservatives and Labour could have influenced their vote share if the issue space had not included a viable centrist third party. This gives us the opportunity to measure both the effect of prospective issue voting in a multiparty election and the electoral significance of a third party. We will show that, given the party configuration in 1987, none of the three could have substantially improved its vote share by moving in the issue space, but without the Alliance, Labour could have substantially increased its share by moderating its issue positions. This, of course, is consistent with events that followed. Using data from the 1992 election, we show that voters did perceive a change in Labour's issue positions after the 1987 contest; our 1987 results provide predictions supported by the 1992 data. Our analysis demonstrates that prospective issue voting is an important component of multiparty elections, since it yields strong evidence that individuals are much more likely to vote for parties closer to their own position on a variety of issues.

Research on the British case typically focuses only on vote shifts or judgments relating to the two main parties, Conservative and Labour. The Liberal or Alliance parties usually are ignored, and those who vote for them tend to be excluded from analyses (e.g., McAllister and Studlar 1992, Mishler, Hoskin, and Fitzgerald 1989). Most of the aggregate-level popularity function literature models Conservative popularity (as either a percentage or share of the two-party vote) and only accounts for the Alliance as an intervention effect, not as a choice facing voters (see, e.g., Sanders 1996). Another strategy is to assume that the Liberals or the Alliance are positioned midway between the Conservatives and Labour (which is not true on all issues) and proceed to assign vote shares to the parties (McAllister and Mughan 1987). These are ways to make tractable the study of systems with more than two parties and highlight the difficulties, both methodological and conceptual, of studying multiparty systems. Such strategies, however, downplay the role of minor parties and thus minimize any third-party effects, as some of these authors readily acknowledge (e.g., Mishler, Hoskin, and Fitzgerald 1989, 216).

A large part of the dichotomous approach to British elections has been driven by estimation procedures; binomial probit and logit are readily available tools for analyzing two-party races. Yet, another factor is the willingness to make a strong assumption about party competition in Britain (Alvarez and Nagler 1998a). The literature typically assumes rather than demonstrates that British voters choose primarily between Labour and Conservatives, without much consideration of centrist parties (either the Alliance or the Liberal Democrats). This is a matter that can be examined empirically, and we would be well served to

adopt methods that allow us to understand fully how voters view their choices.

Comparisons restricted to the Conservatives and Labour provide limited insight into voter behavior in the face of three parties. Some authors recognize this problem. For example, Heath et al. (1991, 218) note that "one important reason why Labour does rather poorly according to this model is that the Alliance position was closer to Labour's than it was to the Conservatives' position, thus leaving the Conservatives with a larger territory over which to gather votes." Despite the general significance they accord to longterm factors in understanding British elections, their comment suggests it is important to consider multiparty politics. It is a fallacy to pretend that the third party does not affect the fortunes of the other two parties. A model that considers voter choice among all three parties allows us to determine the influence of issues in British elections as well as the effect of economic evaluations in the multiparty setting. It also enables us to determine the effect not only of the third party but also of its withdrawal.1 Ignoring the three choices voters face underestimates the effects of issues and of third or minor parties on election outcomes.

Our well-specified model of voter choice in the 1987 election has at least four features that make it superior to past efforts. First, we separate the three choices and allow the voter to consider simultaneously all three parties. Second, we do not make unduly restrictive assumptions about the influence of a third party on the relative probabilities of choosing either of the other two parties. Third, we include explicit measures for the distance between respondents and parties on seven different issues. With these measures we estimate both the influence of each issue on the vote choice of individuals for all three parties and the effect of movement by the parties on these issues. Fourth, we include measures of voter evaluations of past economic performance in terms of inflation, unemployment, and taxation. These variables allow us to examine retrospective economic voting for all three parties.

With our model we can test directly the competing hypotheses about British general elections. First, we examine the importance of the positions taken by Labour on such key issues as defense and nationalization, which we find account for a portion of Labour's lack of success in 1987. Second, we measure the influence of a major short-term force, voter perceptions of the economy. We predict how different the 1987 election would have been if the perceptions had been the same as they were in 1992, and we find that

¹ Whitten and Palmer (1996) use multinomial logit to study the choices of British voters for the three parties in the 1987 election. That method provides statistical efficiency compared to successive binary logits, but Whitten and Palmer are mistaken to imply that its results differ from a series of binary choice models comparing two-party pairings. More important, by using only voter-specific characteristics as independent variables rather than measures that incorporate the party positions on issues, Whitten and Palmer are unable to determine the effects of movements by the parties on the issues, which is a fundamental substantive concern of the recent literature on British elections. See Alvarez and Nagler (1998a) for further discussion.

Labour and the Alliance would have received greater shares of the vote. Third, we estimate where Alliance voters would have gone if that party had not been in the race. In a contest between only Labour and the Conservatives in which both maintained the same respective positions on the issues, Labour would have received slightly more of those votes. If Labour had adjusted its positions in the absence of the Alliance, it would have received a larger share, which would have given it about as many votes as the Conservatives. All this allows us to pit the two major competing theories of elections, economic and issue voting, against each other.

ISSUE VOTING IN BRITAIN

The literature on British elections debates the relative importance of short- versus long-term effects and the importance of Labour's shifting policy positions throughout the 1980s. Before the 1970s such long-term forces as social class and party loyalty dominated empirical studies of British voting behavior. More recent work has begun to stress shorter term factors, including economic performance and issue positions of the parties (e.g., Alt 1979; Clarke, Mishler, and Whitely 1990; Clarke and Whitely 1990; Crewe 1992; Mishler, Hoskin, and Fitzgerald 1989; Price and Sanders 1993; Sanders 1996). Most of this literature analyzes aggregate-level popularity functions to establish that shortterm factors, principally economic, do matter. In addition, researchers have sought to establish the influence of prime ministerial popularity and such short-term variables as the Falklands War (Clarke, Mishler, and Whitely 1990; Stewart and Clarke 1992). These effects are generally held to be of growing importance due to the erosion of longer term party and class ties (Clarke and Stewart 1984).

Ivor Crewe is especially forthright in arguing that shorter term factors specifically underlay the unprecedented third consecutive Conservative victory in 1987 (Crewe 1992). He notes that in "prosperity... lies the key to Conservative victory" (p. 352). Not only did people believe that both the economy in general and family living standards improved between fall 1986 and summer 1987, but also there was a "close coincidence" between economic perceptions and the Conservative/Labour vote. By that Crewe seems to mean that Conservative voters generally thought the economy had done well, whereas Labour voters did not.²

Crewe (1992) also stresses two other factors. First, he notes that the Labour leader, Kinnock, was a drag on the party vote, although he marked a major improvement over the previous leader, Michael Foot. Thatcher, however, was an electoral asset for the Conservative Party. Second, Crewe claims that issue positions in general favored Labour (although defense is alleged to be a liability, as it is to most Left parties,

including in a small way the Alliance).³ But for Crewe the central issue was the economy, and on this Labour was clearly at a disadvantage, given the public perception that times were generally good economically. His findings for 1987 thus square quite well with the time-series evidence presented in studies such as Sanders (1996) or Clarke and Whiteley (1990).

By contrast, Heath et al. (1991) focus on short-term political factors, the "deliberate strategies pursued by parties" (p. 220). Among those they identify as important is the fielding of more candidates nationally by the center parties, both through the very formation of the SDP and in terms of decisions by the Liberals. This directly affected support for the major parties and contributed indirectly to other factors, such as tactical voting (Table 13.15, p. 220). Their work also provides a sustained look at the importance of issue effects in the 1987 election.

Despite the strengths of aggregate-level studies, they necessarily downplay issue effects. Good data are available on popularity and, of course, the economy, but similar series on policy positions are not. Yet, Labour's persistent rightward movement over the last two decades has generated many fierce debates within the party, in the press, and in the academic community about its effect on Labour's electability (Shaw 1994, 1996). For some, the 1987 election marked a "major watershed" for the party in terms of its attempts to sell itself to the voters (Harrop 1990; Wring 1996, 116).

Heath et al. (1991) present one of the first systematic looks at the effect of Labour's policy shifts that is specifically grounded in a treatment of issues in the 1987 election. They examine the position of respondents on five 11-point policy scales and assume that voters cast their ballot for the party closest to their own position on each issue. These individual issue distances are then combined into an overall scale, and the same arithmetic calculation is made. As the authors themselves recognize, this accords each issue equal weight and means that issues on which the parties are seen as close together carry less weight in the overall calculation (Heath et al. 1991, 217-8). They conclude that Labour would have garnered 28% of the vote, Alliance 29%, and the Conservatives 43% if voters had chosen the party closest to themselves on the scale Heath et al. computed. It is important that gains to be made by moving issue position are eliminated by the presence of other parties: "A party's fortunes depend not on its absolute position but on its positions relative to other parties" (p. 219, emphasis in original). Hence, Labour could have gained more votes by a shift toward the center, but further gains were limited by the presence of the Alliance (p. 218). Thus, the presence of a third party at the center can have important consequences for the effect of policy shifts on electoral outcomes.

Garrett (1992), in some ways, takes a sophisticated middle path between the two bodies of literature stressing either short-term or longer term forces. He anchors a discussion of the 1987 election firmly in an extensive analysis of class and socioeconomic variables,

² See also Butler and Kavanagh 1988 and more recently Sanders 1996 on the importance of perceptions of Conservative competence in managing the economy.

³ We provide contrary evidence in Table 4, however.

		Conservative	Labour	Alliance	N
Inflation ^e	Decreased	62.5%	12.5	25.0	
	Same	56.4%	21.5	22.1	1,592
	Increased	32.5%	40.8	26.8	1,439

	Women	45.6%	30.3	24.2	1,602
Total sample		45.2%	30.6	24.2	3,056

Note: Table entries are the percentage of respondents belonging to each row-variable extegory who voted for the designated party. Percentages sum to 100 sorces rows.

"For inflation, unemployment, and taxes, each row corresponds to voters who claimed the economic indicator had decreased, stayed the same, or increased since the 1983 election

^bFor defense, Phillips Curve trade-off, redistribution, and onme, each row corresponds to voter self-placement on the sease. See Appendix A for the complete question wording.

but he argues that the Conservative social reforms shifted the preferences of the electorate as a whole to the right, closer to the Conservative Party. For Garrett, this shift documents that the Conservatives' continued success was predicated on their issue positions and that issue voting was widespread in the 1987 election. He shares the concerns of Heath et al. for social forces, but he also appreciates Crewe's concern for what might be termed relatively short-term factors. In contrast to Crewe, however, who clearly sees retrospective and performance criteria as paramount, Garrett views issue voting as much more central to the Conservative victory.

In sum, the literature is divided over whether issues and retrospective economic evaluations matter much in British elections. In part, the two sides talk past each other because they have no unified model of vote choice that considers multiple parties and that can offer precise estimates of the influence of issues and the economy.

AN INITIAL LOOK AT VOTING IN 1987

The 1987 election offers an especially rich opportunity to test these theories. Since 1945, there have been three viable national parties in British politics, but not until the dual elections of 1974 did the Liberals, in this period the electorally weakest party, obtain roughly 20% of the national vote. In 1983, the Liberal/SDP

combination (the Alliance) garnered 25.4% of the vote, just 2% less than Labour, and it seemed British voters finally had a "real" third choice.

Table 1 presents the percentage of voters who supported each party, along with their demographic traits, economic perceptions, and issue positions. The data are from the 1987 British Election Study (Heath, Jowell, and Curtice 1989). In accord with common class-based theories of British elections, a strong class orientation can be seen in Table 1. The Conservative Party was supported by 53.4% of white-collar voters but only 34.6% of blue-collar workers. Similarly, 43.4% of the latter voted Labour, compared to 20.6% of white-collar workers. There was no large distinction between the two groups in Alliance voting: 22% blue collar and 26% white collar.

We also examine voting behavior according to whether respondents thought inflation, unemployment, and taxes had decreased, stayed the same, or increased since 1983. Economic factors appear to enter strongly into the choice between the Conservatives and Labour but less strongly into the decision to vote for the Alliance. The Conservatives did almost twice as well among those who felt inflation had stayed the same as among those who felt it had increased. Similarly, Labour did almost twice as well among voters who felt inflation had increased as among those who felt inflation had stayed the same. Again, there is very little difference between the two groups in the Alliance

vote: 22.1% versus 26.8%. Similar patterns hold for unemployment and taxes.

The data in Table 1 indicate that issue perceptions also may have played a large role in this election. We present the party percentages based on voters' selfreported views about defense, the relative importance of government efforts to fight either inflation or unemployment, redistribution of income, and crime. Voters to the right on defense spending, relative emphasis on fighting inflation or unemployment (i.e., the Phillips Curve trade-off), redistribution of income, and crime went Conservative, whereas those to the left on these issues were more likely to vote for Labour. The Alliance seems to have been favored about equally by voters who described themselves as moderate or liberal on the issues, and it ran worse among voters who described themselves as conservative on the issues. Unlike recent U.S. elections, there is no gender-gap among the parties. Each did almost identically well among men and women.

These bivariate relationships tell us little about the relative importance of class, economic evaluations, and issue positions. To assess which factors were more important in this election, and to test the various accounts advanced about British elections in general, we need to use multivariate methods and develop a fully specified model of vote choice, which we do in the next section.

MODELS OF MULTIPARTY ELECTIONS

Any model of voter choice in a multiparty setting should allow voters to consider simultaneously all viable parties. It should allow voters to weigh party positions on the issues and consider party performance on the economy. The model also should allow voters of different demographic traits to have different preferences for different parties. It should permit the effects of each independent variable to have a differential influence on the odds that a voter will pick each party, recognizing that the parties use different strategies to gain voter support. Also, and this is especially important in multiparty races, it should not impose the independence of irrelevant alternatives (IIA) property on the voters.

The Π A property holds if the ratio of the probability of voter i choosing alternative C to the probability of voter i choosing alternative L does not depend upon the other alternatives available in the choice set. Technically,

$$\frac{P_{i}(C)|\{S\}}{P_{i}(L)|\{S\}} = \frac{P_{i}(C)|\{T\}}{P_{i}(L)|\{T\}},$$
(1)

where S and T are sets of alternatives, both containing C and L; $P_i(C)|\{S\}$ denotes the probability of the i^{th} voter choosing the Conservatives from choice set S; and $P_i(C)|\{T\}$ denotes the probability of choosing the Conservatives from an alternative set of choices, T. $P_i(L)$ is defined similarly for Labour.

Equation 1 says that given two choices (C and L) the ratio of the probability of selecting C to the probability

of selecting L does not change if the choice set is altered from S to T. In other words, even if S contains only C and L, but T contains C and L as well as ten other choices, the i^{th} individual's relative probabilities of choosing C and L would be unchanged. In the British case, ΠA implies:

$$\frac{P_i(C)|\{C,L\}}{P_i(L)|\{C,L\}} = \frac{P_i(C)|\{C,L,A\}}{P_i(L)|\{C,L,A\}}.$$
 (2)

Or IIA implies that the presence or absence of the Alliance would not change the relative probabilities of any single voter choosing between the Conservative and Labour parties. This is a very strong substantive assumption to make about voters, and it should not be made since it is probably untrue. It suggests that voters are incapable of seeing one party as a substitute for another. For instance, under IIA a voter could not see the Alliance as a substitute for Labour. Let us say a voter has a probability of .5 of voting Labour and a probability of .5 of voting Conservative in a two-party race. When the Alliance is added, if IIA is maintained, the voter could not have a probability of .5 of voting Conservative and a probability of .25 each of voting Labour and Alliance. Yet, such a scenario is plausible for a voter who sees no difference between Labour and the Alliance and views them as identical leftist alternatives.4

Because such a strong substantive assumption should not be made about voters in multiparty elections, we specify and estimate a model of voter choice using multinomial probit that does not impose IIA.⁵ We assume that each voter's utility is composed of an observed, systemic component and an unobserved, random component. The systemic component of utility can be specified with individual-specific variables, such as characteristics of the voter, and choice-specific variables, such as characteristics of the party; this allows a detailed examination in one empirical model of how differences among voters and parties influence voter choice. We assume that the random disturbances have a multivariate normal distribution, and thus we estimate the model with multinomial probit.

We follow the Alvarez and Nagler (1995) implementation of multinomial probit, which assumes that the respondent's utility is a function of choice-specific and individual-specific characteristics:

$$V_{q} = a_{i}\psi_{i} + X_{q}\beta + \varepsilon_{q}, \qquad (3)$$

where:

 V_{ij} = utility of the i^{th} voter for the j^{th} party; a_i = characteristics of the i^{th} voter;

⁴ This is an extreme case, as most voters could distinguish between Labour and the Alliance, but it clarifies the point.

⁵ The multinomial probit technique is relatively new to political science. We use the implementation detailed by Alvarez and Nagler (1995, 1998b), which is also used in Alvarez (1997, 1998) and Alvarez and Nagler (n.d.). Others using the technique are Lacy and Burden (1999) on the 1992 U.S. presidential election; Dow (1997) on French presidential elections; Lawrence (1997) on U.S. presidential primary elections; Quinn, Martin, and Whitford (1999) on Dutch elections, and Schofield et al. (1998) on both Dutch and German elections.

 X_{ij} = characteristics of the j^{th} party relative to the i^{th} voter:

- ψ_j = a vector of parameters relating the characteristics of a voter to the voter's utility for the j^{th} party;
- β = a vector of parameters relating the relationship between the voter and the party (X_{ij}) to the voter's utility for the party; and
- ε_{y} = random disturbance for the i^{th} voter for the j^{th} party.

We estimate one set of β 's (one for each prospective issue) and two sets of ψ 's. One set of ψ 's examines the relative effect of each voter attribute on the likelihood of the voter choosing Conservative over Alliance, and the second set examines the relative effect of each voter attribute on the likelihood of the voter choosing Labour over Alliance.

The flexibility of the multinomial probit technique gives us the opportunity to answer several questions about the 1987 British general election. First, we can determine the effect of a wide array of voter attributes on choices, controlling for many other competing factors. Second, we can examine the dynamics of party positions on prospective issues. Since the multinomial probit technique allows us to consider the position of each party relative to voters, we can see how changes in party position influence expected vote share. We also can see what might occur in British elections if one party—the Alliance—were to drop out altogether. Through such analyses, we can begin to understand how parties compete for the same voters. This lets us ascertain how British voters "group" the parties in the issue space.

Yet, the British electorate presumably did not view these three choices as truly distinct in 1987. Common wisdom held that the Alliance was a substitute for Labour, or at least closer to Labour than to the Conservatives. Despite this common wisdom, few empirical works consider the possibility of choice grouping or the possible violation of the IIA assumption (e.g., see McAllister and Studlar 1992 or Stewart and Clarke

⁶ A complete discussion of the derivation of the three-choice MNP model is given in Alvarez and Nagler (1995) and Hausman and Wise (1978). Beginning with the utility specified in equation 3 for each party, we assume that the disturbances are distributed multivariate normal, with mean zero and covariance matrix Σ . We write the probability that voter ι will choose candidate 1 as:

$$P_{i1} = \int_{-\infty}^{\frac{R_1 - R_{21}}{\sqrt{\sigma_1^2 + \sigma_2^2 - 2\sigma_{12}}}} \int_{-\infty}^{\frac{R_1 - R_{21}}{\sqrt{\sigma_1^2 + \sigma_2^2 - 2\sigma_{12}}}} b_1(\eta_{21}, \eta_{31}; r_1) d\eta_{21} d\eta_{31}, \quad (4)$$

with b_1 being the standardized bivariate normal distribution and r_1 being the correlation between η_{21} and η_{31} :

$$r_1 = \frac{\sigma_1^2 - \sigma_{13} - \sigma_{12} + \sigma_{23}}{\sqrt{(\sigma_1^2 + \sigma_2^2 - 2\sigma_{12})(\sigma_1^2 + \sigma_3^2 - 2\sigma_{13})}}.$$
 (5)

We obtain similar expressions for P_{12} and P_{13} . We assume the disturbance variances are one, which implies that the off-diagonal elements of Σ give correlations between pairs of disturbances. We estimate two of these error correlations in our MNP analyses presented below (we estimated other combinations of error correlations and the results of those estimations are not significantly nor substantively different from those presented here).

1992 on the 1987 British election). It is important that the multinomial probit model we use also allows us to test for the violation of the IIA assumption. If we find that IIA is violated, then we learn something very important about voting behavior. The relative probabilities of a voter choosing between two parties are dependent upon the presence of a third party. This tells us that the party system, the issue positions of parties, and the general electoral context are all important features determining voter decisions in multiparty elections.

A Model of the 1987 Election

We view the voters' utility for each party to be a function of the voter's position on the issues relative to the party and of characteristics of the voter, which we describe below. The inclusion of issue variables allows us to test how much "issues matter" in British elections. given the debate in the literature discussed earlier. Furthermore, the effect of class in British elections has diminished considerably (Crewe 1974; Crewe, Sarlvik. and Alt 1977; Sarlvik and Crewe 1983). Working from the framework of the spatial model of elections, we include variables for the distance between the voter and each party on defense, government emphasis on inflation versus unemployment (i.e., the Phillips Curve trade-off), taxes, redistribution of income, nationalization of industry, crime, and social welfare programs.⁷ The party position on each issue is taken to be the mean of the party placement on the 11-point issue scale by all respondents. We use the absolute value of the difference between respondents' position and the party's position as a measure of issue distance on each item.8

Hand in hand with the realization that issues are replacing class in framing voter decisions in British elections is a growing realization of the effects of voter perceptions of the economy. This has occupied much of the empirical work on British elections (Alt 1979; Lewis-Beck 1988; Studlar, McAllister, and Ascui 1990). Accordingly, we include variables for the voter's perception of recent changes in inflation, unemployment, and taxation levels (McAllister and Studlar 1992). This allows a test of the retrospective voting model in a three-party setting.

⁷ We use the term "Phillips Curve trade-off" to describe the inflation versus unemployment variable throughout this article. The British Election Survey framed the question using the trade-off depicted by the Phillips Curve, asking voters to place themselves and the parties on a scale where one endpoint is prioritizing employment and the other is prioritizing inflation reduction. The question did not explicitly use the term Phillips Curve, since some respondents would not be familiar with it, but the wording described the academic and popular understanding of the macroeconomic trade-off implied by the term. * By using the distance from the respondents' self-placement to the mean placement of each party-rather than the distance from the respondents' self-placement to the respondents' placement of the party—we avoid contaminating our measure with the tendency of respondents to project their favored candidates closer to their own ideal issue position. In another analysis we examined models with both of these measures of the party's position on each issue and found that it did not influence our results appreciably (Alvarez and Nagler 1998b).

Note: All three economic variables are coded such that respondents who felt that inflation, unemployment, or taxes had decreased since the last election were coded with higher values. Values in the Conservatives/Alliance column indicate the effect of each independent variable to the utility of the respondent choosing the Conservative Party relative to the utility of choosing the Alliance Values in the Labour/Alliance column indicate the effect of each independent variable on the utility of the respondent choosing the Labour Party relative to the utility of choosing the Alliance. To compute the probability of choosing any party given values of the Independent variables, see note 6. Asteriak signifies attainable significance at the .05 level. Standard errors are in parentheses.

We also include demographic measures of the respondents. To allow for the possibility that class did matter in the 1987 election, we have a number of control variables. First, as an indicator of class affiliation, we determine whether the voter occupies a blue-collar job. Union membership has long been considered a staple of Labour support, but it is possible this source has weakened in view of the diminution of the

trade union movement during the first two Thatcher administrations. We include a dummy variable to examine the effect of union membership on voter choice. As a third control for class, we have a dummy variable that measures whether the voter is a public sector employee.¹⁰

Demographic variables other than class have loomed large in research on British elections. The regional divisions in recent voting patterns have spurred a flurry of works, even though the growing North-South political cleavage may be more an artifact of economic divisions than specific to certain regions (Crewe 1992; McAllister and Studlar 1992). We included regional dummy variables to test these assertions. Due to the massive sale of council houses during the Thatcher years, a policy no doubt designed to appeal to the moderately well-off working classes, it is asserted that homeownership played some role in Thatcher's success in 1987 (Crewe 1992). Accordingly, we have a dummy variable for homeownership. We also include measures of the respondent's age, sex, income, and education.

Multivariate Model Results

We present the multinomial probit estimates in Table 2. The dependent variable is respondents' self-reported vote choice. The estimates for the effects of the issue distance variables are given in the first seven rows. The other independent variables follow, arranged in two columns. The first column contains coefficients for the effect of each variable on vote for Conservatives relative to the Alliance; the second column contains coefficients for effects on votes for Labour relative to the Alliance. At the bottom of Table 2 are the estimates for the two error correlations.

These estimates shed substantial light on a number of hypotheses. First, note that all the issue distance variables have statistically significant effects on vote choice. The farther a voter from each party on each issue, the less likely is the voter to choose that party. In addition, some issues (defense, taxation, and nationalization) appear to have a stronger effect than others, especially redistribution, crime, and government policy on unemployment and inflation.

Perceptions of the national economy also affect choices. Perceptions of recent changes in both inflation and unemployment significantly affect Conservative voting relative to Alliance voting. For both variables, the positive sign implies that people who thought inflation or unemployment had improved in the past year were significantly more likely to vote for the Conservatives than for the Alliance. Neither of these variables nor taxes had a significant influence on the choice between Labour and the Alliance. This suggests that voters did not distinguish between the two based

⁹ Categories seven through fifteen of the occupation variable were coded blue collar, see Appendix A for a list of the occupation codes.

¹⁰ We examined alternative operationalizations for class in this election. In particular, we used the Heath-Goldthorpe categorization of individuals into occupation groups (salariat, routine nonmanual, petty bourgeoisie, foremen and technicians, and working class [Heath, Curtice, and Jowell 1985]). This alternative specification did not add explanatory power to our model, and we do not present those results here.

on retrospective economic evaluation. As the retrospective model predicts, the incumbent party was punished or rewarded according to respondents' views of the economy. Apparently, neither the Alliance nor Labour convinced voters that they were the superior alternative on this dimension, as the two challenging parties divided equally the spoils. Notice that this is different from the inference one could draw from Table 1. The bivariate results there suggest that Labour won the votes of people dissatisfied with the economy, but that relationship disappears in a fully specified model.

The variables used to control for class (union membership, public sector employee, blue-collar worker, family income, and education) confirm the posited class bias in voting among the three parties. Union members are significantly less likely to vote for the Conservatives than for the Alliance but are more likely to vote Labour than the Alliance. Family income shows a similar effect; those better off are more likely to vote Conservative than Alliance and more likely to vote Alliance than Labour. Labour had a large advantage over the other two parties with blue-collar voters. ¹¹

Last, we give the estimated error correlations at the bottom of Table 2. These account for factors not included in the systemic component of our multinomial probit specification, which are correlated across parties. The two error correlations are statistically significant: We estimate a positive correlation between Labour and the Alliance (.32) and a negative correlation between the Conservatives and Labour (.43).¹² Methodologically, these significant error correlation estimates demonstrate that the IIA condition is violated, and estimation techniques such as multinomial logit or conditional logit that impose this assumption on the data are likely to produce incorrect inferences about voter decisions in this election. This supports our argument that IIA is a restrictive assumption to make about voters in multiparty elections.

about voters in multiparty elections.

But the multinomial probit estimates of both the random and systemic components of our model are

11 As mentioned in note 10, we used the Heath-Goldthorpe classification of occupations. We reestimated our model with four dummy variables: salariat, petty bourgeoisie, routine nonmanual, and foremen and technicians (working class was the excluded category). A likelihood ratio test between this expanded model and the one presented here produced a χ^2 value of 5.8, which is well below the critical χ^2 value of 15.5 with 8 degrees of freedom. This means that the Heath-Goldthorpe variables do not contribute statistically to the explanatory power of our model. Further examination of the expanded model showed that all coefficients of interest in our analysis—in particular, the estimates for issue distances, retrospective economic evaluations, and the error correlations—are not signifi-

cantly different between these two specifications.

¹² If none of the error correlations were significantly different from zero, then we could not reject an "independent probit" model, in which the utility errors are independent of one another. The independent probit specification is essentially the same as a conditional logit model, except that the former assumes a normally distributed (but independent and identically distributed) error process, and the latter assumes an independent and identically distributed logistic error process. Conditional logit and multinomial probit share the same systemic component of the models, with the utility for each choice conditional upon the characteristics of the choice as well as the voter, but conditional logit assumes independent disturbances. See Alvarez and Nagler (1998a) for further discussion.

based on the assumption of sincere voting in the 1987 British election. Sincere voting occurs when people vote for their most preferred candidate without taking into account that candidate's chances; strategic voting occurs when people vote for a less preferred candidate rather than waste their vote on a candidate with little chance of winning (Abramson et al. 1992). Theoretically, based on the calculus of voting (Downs 1957; McKelvey and Ordeshook 1972; Riker and Ordeshook 1968), there are reasons to suspect that strategic voting occurs, but empirical tests in multiparty or multicandidate elections have always shown that it does not occur to the extent theory predicts.¹³ To test for strategic voting, we reestimated the model in Table 2 with three variables measuring the competitiveness of each party in the voter's constituency in 1983. We expect these coefficients to be negative if voters acted strategically in 1987, since they would measure the unwillingness to vote for parties with little chance of winning the district. Each coefficient was negative, and two (Conservatives and Labour being last in the constituency) were statistically significant. Most important, however, is the fact that the other estimates in our model are not influenced by the addition of the strategic voting variables. Thus, the interpretations of the multinomial probit results given here are not influenced by sophisticated voting behavior.14

We now turn to two other questions about this particular British election and about multiparty politics more generally. First, how can we measure precisely the relative effects of economic factors and issue positions in multiparty elections? Second, how can we understand party competition for voters in the issue space? We answer both with our multinomial probit results in the remaining sections of this article.

Effects of Economics and Issues

As with most discrete choice models, it is difficult to interpret directly the coefficients from the multinomial probit model. The model is highly nonlinear, and the effect of estimated coefficients depends upon the values taken by the other variables and coefficients. Thus, we move to a series of secondary analyses.

Our first illustration of the substantive meaning of the multinomial probit estimates from Table 2 is through "first differences" (King 1989). First, we set all the variables at hypothetical values and determine the probability that this hypothetical voter will support each of the three parties. The hypothetical voter we postulate here has a .34 probability of supporting the Conservatives, a .40 probability of supporting Labour, and a .26 probability of supporting the Alliance. 15 Then

¹³ Various empirical analyses are available: Canadian elections (Black 1978), American presidential primaries (Abramson et al. 1992), and British elections (Cam 1978; Franklin, Niemi, and Whrtten 1994; Galbraith and Rae 1989; Heath, Curtice, and Jowell 1991; Johnston and Pattie 1991; Niemi, Whitten, and Franklin 1992).

¹⁴ This analysis of strategic voting is reported more fully in Alvarez and Nagler (n.d.).

¹⁵ The actual values of the independent variables we use to construct the hypothetical voter influence the baseline probability estimates,

we alter one independent variable at a time and recompute predicted probabilities for the hypothetical voter, with all other variables held at their initial values. The difference between these probabilities is the effect of the change in the independent variable of interest, holding the other variables constant.

The estimated first differences for the three retrospective evaluations of the national economy and for four of the issue distance variables are given in Table 3. At the top are the baseline probabilities for the hypothetical voter. Then, for each economic evaluation variable of interest, we show the marginal effect on support for each party of changing the values of that independent variable from one end of the scale to the other. Note that views on inflation and unemployment had a stronger effect on party choice by our hypothetical voter than did changes in views on taxation. The first differences for change in Conservative support are .24 (inflation), .24 (unemployment), and .06 (taxation). Thus, our hypothetical voter would be .24 more likely to vote Conservative if he thought that either inflation or unemployment had improved in the past year rather than grown worse but only .06 more likely to vote Conservative if he thought taxation had become better over the past year. Notice that these changes in support seem to come equally from Labour and the Alliance. The probability of this voter choosing Labour could change by .13 based on his view of inflation; his probability of choosing the Alliance could change by .11 based on inflation. The results for unemployment are similar. Apparently, neither the Alliance nor Labour convinced voters that it was the superior economic alternative. Again, we find support for the retrospective model: The estimated effect of changes in views on the economy is huge. Yet, we also find that the retrospective model does not illuminate the choice between the two nonincumbent parties. The estimates for issue effects presented next, however, do show how voters chose between the two.

We present similar results for four issues—redistribution, welfare, crime, and defense—in Table 3. We examine the effect on party support of moving the hypothetical voter from the left of the scale to the median voter's position and then to the right of the scale. The results are perfectly consistent with our intuition about the parties' appeal. The likelihood for supporting Labour is highest when the hypothetical voter is to the extreme left on the issue scale. At the median position, he is more favorable to the Alliance than either extreme. At the far right, the likelihood of supporting the Conservatives is maximized.

Although movement from the far left of the scale to the far right is extreme, it helps demonstrate the power of issues in British politics, controlling for class and other demographic effects. These four issues have a dramatic influence on whether the hypothetical voter supports the Conservatives or Labour. Going from the

Note: Probabilities are evaluated for a respondent with typical values for other variables. The hypothetical voter is set to be at the sample mean distance from each party on each issue. This voter is male, a blue-coller union member, from the north, and owne his home. He is also of mean income, education, and age. Last, his perceptions of the economy were also set to the sample mean values. Probabilities are computed with the respondent first set at one extreme on the variable of interest, then at the other extreme. For issue variables, we also include a row with the respondent at the median position on that issue. The value of the median position is given in parenthesis.

left to the right on each of these issue scales increases the probability of support for the Conservative candidate by as much as .21. Defense has the strongest effect, followed by welfare, redistribution, and crime. Notice that there is little change in the probability of choosing the Alliance as the voter moves from the left to the right on these four issues. The Alliance had little appeal to voters at either extreme, but the hypothetical voter's proximity to the center has a major effect on his choice between the Alliance and Labour.

Table 4 displays the mean positions of the parties and respondents on each of the seven issue scales. These are 11-point scales, and the party positions (an average taken from voter placements of the parties in the survey) show a wide gap between the Conservatives and Labour in this election. On welfare and defense (the two issues with the largest effect in Table 3), the difference between them is more than 3 points on these

but they do not have much influence on the important quantities—the probability differences. In other words, different hypothetical voters still would produce the probability differences we present in Table 3.

scales.¹⁶ For crime, the issue with the least effect in Table 3, notice that the parties staked out very similar positions, separated by only about one point.¹⁷

There are implications here for the theoretical literature about American national elections. In early debates by Shepsle (1972) and Page (1978), both maintained that in the context of different models of campaign dynamics, candidates and campaigns often have the strategic incentive to obfuscate their positions to the electorate, echoing work by Key (1966). If the voters cannot perceive a distinction between the parties on certain issues, then it is difficult for those issues to factor strongly in voter decision making (Alvarez 1997). Here we see strong support that view, since the issues on which the parties are most separated are the issues with the most influence on our hypothetical voter. We also see that on every issue except crime the Alliance was closer to the mean respondent position than were either of the other two parties.

The Effect of the Alliance

Since the multinomial probit estimates can be used to predict the probability of an individual choosing each

16 Consistent with common wisdom, by 1992 Labour had moved much closer to the mean on many issues. The British Election Study that year used a 7-point scale on three issues (defense, welfare, and women's rights) rather than the 11-point scale used on all other issues in 1992 and on all issues in 1987. To facilitate comparison we compared the ratio of the distance from Labour to the mean respondent's position to the standard deviation of all respondents' opinions on an issue. For every measure, Labour moved closer to the mean. On defense, it went from 1.19 standard deviations to the left of the mean to only .44 standard deviations to the left.

¹⁷ The issue placements in Table 4 illustrate the error, made m many analyses, of assuming that the Alliance party lies exactly between the Conservatives and Labour (cf. McAllister and Mughan 1987; Mishler, Hoskin, and Frtzgerald 1989). On some issues such as defense, the Alliance stands virtually at midpoint, but on many social issues—examples here are redistribution and welfare—it is much closer to Labour than the Conservatives. Incorrect assumptions about party positions clearly will lead to inaccurate understanding of British elections.

of the three parties, we can also predict the aggregate vote share of each party. More important, the estimates allow prediction of aggregate vote share in a two-party race with the Alliance omitted. We can use the estimates from the systemic component of utility for the remaining two parties as well as the information in the estimated correlations between the disturbance terms to determine the probability of each voter choosing Labour or the Conservatives. This allows us to estimate the effect of the Alliance on the election. We predict a split of 44.9%, 29.8%, and 25.3% among the Conservative Party, Labour, and the Alliance in a three-way race, and this would give Labour a 39.9% share of the two-party vote between the Conservative Party and Labour. If the Alliance had not been present, leaving a two-way race between the Conservative Party and Labour, we predict a 57.4%-42.6% split favoring the Conservative Party over Labour. The standard errors on each of these numbers is less than 1%. Removal of the Alliance helps Labour somewhat, but to see its full effect on the election we need to take a more dynamic view and consider the behavior of the parties as well as the voters. In the next section we simulate the effects of changes in issue position by the three parties. This offers some insight into post-1987 elections, as Labour in fact changed positions, particularly after its failure in 1992.

The Issues

Changes in respondents' issue positions may not be as interesting to consider as changes in parties' positions. A major criticism of the Labour Party is that in the 1980s it took stands that placed it far from the center of the distribution of voters. What would happen if Labour convinced the electorate that it was more moderate? Could the party have done better in 1987 by moving to more moderate positions? To find out, we simulated movement of Labour's perceived position on each of the seven issues, one issue at a time. We then recomputed the issue distance from each respondent to Labour and calculated new vote shares for each party, with Labour at the postulated position.

We perform these calculations both with the Alliance present and under the counterfactual scenario of a two-party race between Labour and the Conservatives. As the simulation will show, the effects of movement by the parties are much smaller in a three-way race than in a two-way race. In the first portion of Table 5 we show, for a three-way race, for each issue, the position at which Labour would have received its lowest vote share, its actual (mean perceived) position, and the position that would have maximized its vote share (indicated by Labour-Max*). We also show the predicted vote share of all three parties had Labour been perceived at Labour-Max* on each issue, as in the final row of the table we show the predicted vote shares for the parties had Labour moved to Labour-Max* simultaneously on all seven issues. Labour's predicted vote share based on its actual perceived issue positions was 29.8%. According to Table 5, the best Labour could do by a shift on any one issue would be a vote

Note Labour-Max* is the position Labour would have to be perceived to take on each issue to get the maximum vote share in a three-party race. Labour-Max* is the position Labour would have to be perceived to take on each issue to get the maximum vote share in a two-party race. "Estimated vote shares if Labour were perceived to be at Labour-Max* for all seven issues.

share of 32.4% by moving from the left to the center on the nationalization issue. If Labour managed to shift public perception of its positions on all seven issues, then it would receive a vote share of only 36.2%; this is an increase of 6.4% but would still leave Labour almost 5% behind the Conservatives. The prediction is quite precise: The standard error of the predicted vote share for Labor is only 1.08%. Thus, Table 5 provides guidance as to where Labour should move on the issues, but it is clear that issue positions alone cannot account for Labour's poor electoral fortunes.

The apparent magnitude (or lack thereof) of these issue effects might be surprising in view of the estimates presented in Table 3. For instance, we predict that a voter who changes his view on defense could increase his probability of voting for Labour by .24; yet, Table 5 indicates that Labour will gain only 2.1% by moving toward the center on defense, not 24%. This is because the effect of a movement by a party is limited by two factors. First, a shift toward some voters necessarily means a shift away from other voters. Second, the issue space is crowded. Labour is competing with two other parties, and any movement toward the center will leave it closer to another party with which it must share voters.

The second problem described above might lead supporters of Labour to hope for better results in a less crowded issue space with no viable centrist party. The multinomial probit estimation technique allows us to predict the probability of a voter choosing Labour or Conservative without the Alliance as an option. As stated earlier, we can use the information obtained from the multinomial probit estimates, the effect on the voter's utility of his/her distance from the parties, as well as the correlation among disturbances to estimate voter behavior in the absence of the Alliance. For the

second portion of Table 5, we performed simulations identical to those in the first, moving Labour on each issue and reestimating vote shares to find Labour's optimal position, the position at which it would maximize its vote share (Labour-Max₂) in a two-party race without the Alliance. As reported in Table 5, Labour's maximum share of the vote in a two-way race by moving on any single issue is 45.4%. Movement on all seven issues raises Labour's expected hypothetical vote share to 49.8%, with a standard deviation of 1.2%. Note that this is significantly higher than Labour's largest share of the Labour-Conservative portion of the three-party vote reported in the first portion of Table 5 (36.2/(36.2 + 42.0) = 46.3%). Thus, we very clearly see the problem the Alliance caused for Labour. By positioning itself in the center, the Alliance not only took votes from Labour but also minimized the ability of Labour to improve its vote share by strategic movement on the issues.

Table 6 presents results of identical simulations focusing on the Conservatives. In the first portion, our estimates reveal that the Conservatives took a more conservative stance than electorally necessary on all issues but crime. Thus, slight moderation in their message in 1987 would have produced small vote share gains for them, ranging from just under 1% for a centrist shift on nationalization and income redistribution to almost 3% for moderation on defense. Notice also the combined effect of moving the Conservatives to their optimal position on all the issues at once: They win with 61% of the vote. Finally, as shown in the second portion of Table 6, in a two-way race against Labour with the Conservatives at their best position on each issue, they score overwhelming victories on each issue.

Similar simulations for the Alliance in a three-way race are reported in Table 7. On every issue other than crime it managed to position itself closer to the public than either the Conservatives or Labour. Thus, it had

Estimated vote shares if Labour were perceived to be at Labour-Max₂ for all seven issues.

¹⁸ The standard error of the predicted vote share is obtained by sampling over the parameter values using the estimated distribution and computing the predicted share for Labour over 1,000 such trials.

Cons-Max* is the position at which the Conservative Party would have to be perceived on each leave to get the maximum vote share in a two-party race. "Estimated vote shares if the Conservative Party were perceived to be at Cons-Max* for all of the seven issues.

less to gain by modifying positions, and in Table 7 its actual position is quite close to its optimal position on most issues. The delicate balancing act of the Alliance is apparent in the second and third columns of the table. It was slightly to the left of its optimal position on defense, nationalization, and crime, and it was slightly to the right of its optimal position on the Phillips Curve, taxation, redistribution, and welfare issues. Had the Alliance taken its optimal position on any particular issue, it never would have exceeded the vote share of Labour. An optimal position on all issues—that is, even more delicate balancing between the other parties—would have put the Alliance very close to Labour's share (less than one percentage point) but still behind.

The Economy

Parties, especially the incumbent, have other strategic levers than issue positions. There has long been debate over whether the economy matters in national elections and whether the incumbent party has sufficient tools to manipulate the macroeconomy for electoral purpose (Alesina 1987; Alt 1985; Alvarez, Garrett, and Lange 1991; Hibbs 1977; Lewis-Beck 1988; Tufte 1978). As was shown in tables 2 and 3, variables measuring the voter's retrospective evaluation of recent economic performance mattered greatly in the 1987 British election, controlling for issue, class, and other demographic effects.

Yet, these static results tell us little about the dynamics of the macroeconomy and voter preferences. We would like to know what to expect if overall macroeconomic conditions change. In Table 8 we give simple survey frequencies on the three types of economic retrospective evaluations in 1987 and 1992. We are interested in how the British economy appeared to voters in 1987 relative to another benchmark; for this we chose the 1992 election, since the questions in the 1992 British Election Study are almost identical to those in 1987.

The distributions of public opinion shifted dramatically on inflation and unemployment. In 1992, many more British voters than in 1987 felt that the economy had worsened considerably since the previous general election; 19% more believed inflation had increased a

lot, and 24% more felt the same way about unemployment. Even taxes were perceived as increasing, and 12.8% more voters believed they had risen a lot since the last election.

This implies that, relative to 1992, the economy in 1987 was more favorable to the incumbent Conservatives, and that may have enhanced their victory that year. We can see the effect of the economy in 1987 by using the multinomial probit results to simulate predicted vote shares for the three parties under the scenario of a 1987 economy as bad as it appears to have been in 1992.

The series of simulations in Table 9 change the aggregate distribution of economic perceptions among voters in 1987 to match those held by voters in 1992. We first show the sample distribution of vote shares in 1987 and then simulate the vote for altered perceptions of inflation, unemployment, and taxes. The result is surprising. If the economy had been "bad" for the Conservatives in 1987 (i.e., with voter evaluations like those in 1992), the Conservatives still would have won the 1987 election. The difference between the first and last row in Table 9 shows only a 3.7% decline in the Conservative vote, which is split between Labour (a gain of 1.5%) and the Alliance (a gain of 2.2%). The state of the macroeconomy was an important predictor of which party individuals supported in 1987, but it does not seem to have determined the outcome of the 1987 British election. Had the economy been as bad as it was in 1992, the Conservatives still would have won more than 40% of the vote.

TABLE 9. Economic Simulation: Estimated 1987 Vote Outcomes with 1992 Economic Perceptions

The 1992 Election

The 1992 election in Britain was contested under much different circumstances than was the 1987 election. It was the first post-Thatcher election. John Major was the Conservative leader, so the argument that Thatcher's personal appeal could help (or hurt) the party was no longer relevant. Also, as we demonstrate below, Labour had continued its move toward the center on the issues. In addition, the three-party structure was even clearer: The Liberals and the Social Democrats had formalized their 1987 Alliance by merging into the Liberal Democrats. Perhaps most important, the economy was faltering, which should have given a significant boost to Labour. The Conservatives attempted to nullify Labour's potential advantage by arguing that the country was the victim of a worldwide recession, and a Labour government would only compound the economic problems with additional taxes.

Our analysis of the 1987 election provides insights into the 1992 election. In Table 10 we show, for both 1987 and 1992, the mean actual issue placement of the parties and respondents, as well as the optimal placement for the parties in 1987. We can see that respondents perceived changes in the parties' issue positions. Labour was more than 2 points away from its optimal position on two issues in 1987: defense and nationalization. In both cases it moved significantly toward its optimal position (i.e., toward the mean of all voters) in 1992. The Conservatives were more than 2 points away from their optimal position on all six issues in 1987. They only moved significantly closer to their optimal on three of those issues in 1992: defense, nationalization, and welfare. Although this might be viewed as a less concerted effort than that of Labour to achieve an optimal position, the movement by the Conservatives nonetheless represented a larger aggregate move than Labour made. Thus, on balance, we would expect the shifts by the two parties to favor the Conservatives.

We performed an out-of-sample test of the 1987 model by using it to predict the 1992 election. We compared our predictions based on simulated movements by the parties on the issues, both with and without simulated changes in economic perceptions, to what actually happened in 1992. First, we report predictions assuming no change in economic perceptions. Rows 2–5 of Table 11 show what could have been expected in 1992 if perceptions of the economy remained fixed at their 1987 positions but the parties

Note: The 1992 7-point scales for defense and welfare have been converted to 11-point scales by folding around the midpoint (4) on the Initial 7-point acale and rescaling to 11. Respondents were not asked about crime in 1992, and were not asked about European cooperation or women's rights in 1987.

moved on issues to their actual 1992 positions. In those rows we see that if only Labour had moved to its 1992 positions on the issues and the other parties had remained fixed at their 1987 positions, then Labour would have picked up an additional 2.2% of the vote compared to the report of the 1987 vote. But we know from Table 10 that the Conservatives moved more aggressively on the issues in 1992, so it is no surprise that we predict the Conservatives will increase their share by 4.8% when all three parties move to their actual 1992 positions (see row 5). In this case, Labour gains only 0.4% of the vote. Both Labour and the Conservatives gain at the expense of the Alliance. This is the estimated effect of the movement by the parties on the issues in 1992, isolated from the effects of changes in economic perceptions and other factors.

The next four rows of Table 11 show our expectations for 1992 based on 1992 issue positions of the parties and 1992 economic perceptions by the respondents. By computing estimated vote shares when all three parties move to their 1992 issue stance and the economy is perceived as it was in 1992, we can make the following predictions about the 1992 election based on our 1987 model estimates. First, the Conservatives should gain only a very modest increase in vote share, less than 1%. Second, Labour should obtain a higher vote total based on better issue positions and the state of the economy, with its vote rising by 2.4%, to 32.3%. Last, the Alliance is the net loser, since its vote is predicted to drop by 3.3%.

What really happened in 1992? The 1992 survey results are given in the last row. We correctly predicted the Conservative share of the vote (within the standard error). We also correctly predicted that Labour would gain votes and that this would come at the expense of the Alliance/Liberal Democrats. Yet, we underestimated the magnitude of Labour's gain, which we predicted at 32.3% of the 1992 vote, compared to its showing of 37.1% in the survey.

To account for the drop in Liberal Democratic

TABLE 11. Predicted Vote Shares for 1992 Based on 1987 Model

	Three-Party Vote Shares			Two-Party Vote Share	
	Conservative	Labour	Alliance	Conservative	Labour

1992 survey	45.2	37.1	17.1	` '	. ,

Note Entries are predicted vote shares after setting the 1987 party positions to match the observed 1992 positions. Rows 2-4 move one party at a time to the 1992 position. The fifth row moves all three parties to their 1992 positions. The last four rows move parties to their 1992 issue positions, while giving respondents the 1992 economic perceptions distribution. N = 2,131.

^bThe other two parties are fixed at their 1987 issue positions.

[&]quot;This is the distribution of the 2,131 voters in 1987 for whom we can compute estimates

support relative to Labour, we estimated a model for the 1992 election similar to our 1987 model.¹⁹ The results are reported in Table 12.²⁰ A comparison of the 1992 parameter estimates with those from the 1987 election (Table 2) reveals the economy was one factor that helped Labour gain votes in 1992 relative to the Liberal Democrats. In 1992 each of the economic perception coefficients is larger for Labour relative to the Liberal Democrats than the corresponding coefficient for the 1987 model for Labour relative to Alliance (Table 2). Thus, the economic dissatisfaction in 1992 contributed more to Labour than we had anticipated based on the 1987 results.

CONCLUSION

We have uncovered factors that drive the decision of the British voter in choosing simultaneously among three parties. In 1987, retrospective economic evaluations of individual voters were crucial in determining the likelihood of voting for the Conservatives but had very little effect on the choice between Labour and the Alliance; rather, issue positions had a huge influence on the likelihood of voting for Labour. Voters supported the incumbent party primarily based on economic performance, and the choice between the other two parties was based on issues.

The Alliance took more votes from Labour than from the Conservatives. More important, the Alliance severely limited Labour's strategic options and left it almost no chance of winning in 1987. The Alliance simply crowded Labour in the issue space. Even a dismal economy and movement to the correct position on the issues would not have helped Labour with the Alliance in the race. Of course, our analysis also reveals that Labour did not help its own cause by choosing issue positions so far to the left in 1987. Our analysis gives a measure of how valuable centrist positions would be to Labour in the absence of a viable third party. What does this say about "short-term" versus "long-term" effects? It says they both matter. Our contribution here is to measure the short-term effects and demonstrate their magnitude. Similar analyses of

Note: Values in the Conservatives/LDP column indicate the effect of each independent variable on the utility of the respondent choosing the Conservative Party relative to the utility of choosing the LDP. Values in the Labour/LDP column indicate the effect of each independent variable on the utility of the respondent choosing the Labour Party relative to the utility of choosing the LDP. To compute the probability of choosing any party given values of the independent variables; see note 6. *p=.05, **p=.10. Standard errors are given in parentheses.

British elections over time (a project beyond the scope of this article) could offer similar measurement of the long-term factors.

Our findings show that retrospective economic evaluations and prospective issue voting matter greatly in British elections. The translation of both models of voting from their usual two-party setting to the more complicated multiparty scenario shows their resilience and the differences between the two types of political settings. In the multiparty situation, past economic performance can be used by voters when deciding whether to support the incumbent party, and prospective issues factor heavily into the calculations by both parties and voters. Issue positions are the criteria used

¹⁹ This required imputing issue positions for respondents because the 1992 survey used a split-sample design: Half the respondents were asked only about defense, welfare, and womens' rights; and the other half of respondents were asked only about unemployment/inflation, taxation, nationalization, redistribution, crime, and European cooperation. We used the software program Amelia (Honaker et al. 1999) for the imputation. Respondents' issue positions were imputed based on all other individual characteristics used in the model of vote choice. Before implementing the imputation procedure, we dropped respondents who failed to answer all issue questions that they were asked. Thus, since respondents' opinions were omitted by the survey design and not by the respondents' choice, we can be quite certain that the opinions are missing completely at random. We imputed five data sets, and the complete estimation results for this analysis are available from the authors and at the APSR web site. For general references on imputation, see Schafer 1997, Rubin 1987, and Little and Rubin 1987.

²⁰ We report the mean of the parameter estimates across the five estimations; the standard errors are computed accounting for both the estimation uncertainty and the uncertainty across the imputed data sets, as described in King et al. 1998.

by voters to decide which nonincumbent party to support.

These findings come as the consequence of a significant methodological advance. We used a technique relatively new to the study of multiparty elections, multinomial probit, which enabled us to study voter choices for the three major parties in the 1987 British election simultaneously and without restrictive and erroneous assumptions about the parties and the electorate. The multinomial probit technique also provides a unique perspective on the dynamics of multiparty politics, since we can determine the effects on voters of changes in party positions. We also can determine the effects of a change in the party system on voter choices, in this case removal of the Alliance from the election. The ability of the multinomial probit technique to study these components of party politics is unique, since none of the alternatives advanced in the literature can answer these questions.

Similar to previous work, we focus on the role of prospective and retrospective issues in the 1987 election, but we differ by examining both effects simultaneously as well as other influences on voter choice—region, class, and other social attributes of individual voters. Our finding that prospective and retrospective issues have such a strong effect on voters, while controlling for region, class, and demographic characteristics, should end the debate about whether issues and the economy "matter" in British elections. Instead, the focus should shift from whether to how much and to how their influence in particular elections compares to their influence on other British elections, and to elections in other nations. Only then can British elections be placed in their appropriate comparative context.

This work has general implications for the study of other multiparty systems, which usually are seen as qualitatively distinct from two-party systems (Duverger 1954; Sartori 1976). Ever since the collapse of the Weimer Republic, political science has been captivated with the notion that two-party systems imply stability whereas multiparty systems invite fluidity, and hence chaos.21 With very few exceptions, however, most approaches to the study of voter behavior in multiparty systems suppress the very multipartyism that makes such systems interesting. In these systems we do not expect parties to converge to the center, so the strategic calculation of parties about where to position themselves on the issues relative to the voters is crucial for understanding the politics of these systems. Parties are also more likely to leave or enter multiparty systems. We have demonstrated that the presence of a third party crowding the issue space increases the likelihood that an extreme party will win the election. We have also shown that when a party drops out of a multiparty system, the remaining parties have an opportunity to redefine themselves in the issue space to appeal to a larger set of voters.

APPENDIX A: SURVEY QUESTIONS FROM THE 1987 BRITISH ELECTION STUDY

[Q22a] Since the last general election in June 1983, would you say that *prices* have increased or fallen? Please choose a phrase from the card:

- (1) Increased a lot
- (2) Increased a little
- (3) Stayed the same
- (4) Fallen a little
- (5) Fallen a lot
- (8) (Don't know)
- [Q22b] What about unemployment?

[Q22c] Taxes?

Author's Note: In questions 28, 29, 34, 35, 39, and 40, items (b), (c), and (d) are identical to the wording in question 23 and are thus not reproduced below. For each of these questions, box A was coded as 1, box K was coded as 11, and boxes C through J were coded as 2 through 10.

[Q23] Defense:

Some people feel that government should get rid of all nuclear weapons in Britain without delay. These people would put themselves in box A.

Other people feel that government should increase nuclear weapons in Britain without delay. These people would put themselves in box K.

And other people have views somewhere in-between, along here or along here.

(a) In the first row of boxes, please tick whichever box comes closest to *your own* views about nuclear weapons in Britain.

Now where do you think the Conservative and Labour parties stand:

- (b) First the Conservative Party. In the next row of boxes, please tick whichever box you think comes closest to the views of the *Conservative Party*.
- (c) Now in the next row, please tick whichever box you think comes closest to the views of the Labour Party.
- (d) And finally, please tick whichever box you think comes closest to the views of the SDP/Liberal/Alliance? [Q28] Unemployment vs. Inflation (Phillips Curve trade-off):

Some people feel that getting people back to work should be the government's top priority. These people would put themselves in box A.

Other people feel that keeping prices down should be the government's top priority. These people would put themselves in box K.

And other people have views somewhere in-between, along here or along here.

(a) In the first row of boxes, please tick whichever box comes closest to *your own* views about unemployment and inflation.

Now where do you think the Conservative and Labour parties stand:

[Q29] Taxation and Government Services:

Some people feel that government should put up taxes a lot and spend much more on health and social services. These people would put themselves in box A.

Other people feel that government should cut taxes a lot and spend much less on health and social services. These people would put themselves in box E.

²¹ One articulation of this view is Epstein 1967. In general, it is argued that party system attributes (such as the number of parties) are strong factors in determining a nation's political stability (Almond 1960; Duverger 1954; Huntington 1968, Lipset and Rokkan 1967; Powell 1981, 1982; Sartori 1976) More recently, Bartolini and Mair (1990, 143) argued: "The number of parties matters, and variance in this number contributes substantially to the explanation of variance m electoral stability."

(a) In the first row of boxes, please tick whichever box comes closest to *your own* views about taxes and government spending.

[Q34] Nationalization:

Some people feel that the government should nationalize many more private companies. These people would put themselves in box A.

Other people feel that government should sell off many more nationalized industries. These people would put themselves in box E.

(a) In the first row of boxes, please tick whichever box comes closest to *your own* views about nationalization and privatization.

[Q35] Redistribution:

Some people feel that government should make much greater efforts to make people's incomes more equal. These people would put themselves in box A.

Other people feel that government should be much less concerned about how equal people's incomes are. These people would put themselves in box E.

(a) In the first row of boxes, please tick whichever box comes closest to *your own* views about redistributing income. [Q39] Crime (Law and Order):

Some people feel that protecting civil rights is more important than cutting crime. These people would put themselves in box A.

Other people feel that cutting crime is more important than protecting civil rights. These people would put themselves in box E.

(a) In the first row of boxes, please tick whichever box comes closest to *your own* views about law and order.
[Q40] Welfare:

Some people feel that the poor in Britain are entitled to more help from government. These people would put themselves in box A.

Other people feel that the poor in Britain should get less help from government and do more to help themselves. These people would put themselves in box E.

(a) In the first row of boxes, please tick whichever box comes closest to your own views about government help for the poor.

[Q50a3] Class (Blue-Collar): What (is) your job? (Items 7 through 15 were coded as blue collar.)

1. Large employers 10. Semiskilled manual Small employers 11. Unskilled manual 3. Professional: self-employed 12. Own account 4. Professional: employee 13. Farmers: employers, etc. 5. Ancillary 14. Farmers: own account 6. Junior nonmanual 15. Agricultural workers 7. Personal service Armed forces 8. Manual foreman 17. Inadequate information 9. Skilled manual

[Q50] Union: Are you *now* a member of a trade union or staff association?

[Q50f] Public Sector Employee: Which of the types of organization on this card (do) you work for (items 2 through 5 were coded as public):

Private firm or company

2. Nationalized industry/public corporation

3. Local authority/local education authority

4. Health authority/hospital

5. Central government/civil service

Charity or trust

7. Other

[Q55] Education: How old were you when you completed your continuous full-time education? [Divided by 10 for MNP estimation.]

[Q60ab] Homeowner. Do you—your household—own or rent this (house/flat/accommodations)?

[Q64] Family Income: And which of the letters on this card represents the *total* income of your household from *all* sources?

1. Less than £3,000	7. £12,000-14,999
2. £3,000-4,999	8. £15,000-17,999
3. £5,000-5,999	9. £18,000-19,999
4. £6,000-7,999	10. £20,000-24,999
5. £8,000-9,999	11. £25,000-29,999
6. £10,00011,999	12. over £30,000

APPENDIX B: SURVEY QUESTIONS FROM THE 1992 BRITISH ELECTION STUDY

Items on respondents' views of inflation [Q26a], unemployment [Q26b], taxes [Q26c], and employment versus inflation (the Phillips Curve question) [Q35], taxation and government services [Q36], nationalization [Q37], redistribution [Q38], education [Q911], and union membership [Q903c] were identical to the versions of those questions asked in 1987, except that the comparative reference for questions 26a–26c is now to the general election of 1987.

Author's Note: For question 39, box A was coded as 1, box K was coded as 11, and boxes B through J were coded as 2 through 10. For questions 40, 41, and 42, a 7-point scale was used. Box A was coded as 1, box G was coded as 7, and boxes B through F were coded as 2 through 6.

[Q39] European Community

Some people feel that Britain should do all it can to unite fully with the European Community. These people would put themselves in box A.

Other people feel that Britain should do all it can to protect its independence from the European Community. These people would put themselves in box K.

Other people have views somewhere in between, along here or along here.

(a) In the first row of boxes, please tick whichever box comes closest to your own views about the European Community.

Now where do you think the Conservative and Labour parties stand:

- (b) First the Conservative Party. In the next row of boxes, please tick whichever box you think comes closest to the views of the Conservative Party.
- (c) Now in the next row, please tick whichever box you think comes closest to the views of the Labour Party.
- (d) And now, please tick whichever box you think comes closest to the views of the *Liberal Democrats*.

 [Q40] Defense

Some people believe that we should spend much less money on defense. Suppose these people are at one end of the scale at point A.

Others feel that defense spending should be greatly increased. Suppose these people are at the other end, at point G.

And of course, some other people have views somewhere in between, at points B, C, D, E, or F.

(a) Where would you place yourself on this scale, or haven't you thought much about this?

(b) Where would you place the Conservative Party on this scale?

(c) Where would you place the Labour Party on this scale?

(d) Where would you place the Liberal Democrats on this scale?

[Q41] Welfare

Some people feel that the government should see to it that every person has a job and a good standard of living. Suppose these people are at one end of the scale at point A.

Others think the government should just let each person get ahead on their own. Supposed these people are at the other end, at point G.

And of course, some other people have views somewhere in between, at points B, C, D, E, or F.

- (a) Where would you place yourself on this scale, or haven't you thought much about this?
- (b) Where would you place the Conservative Party on this scale?
 - (c) Where would you place the Labour Party on this scale?
- (d) Where would you place the Liberal Democrats on this scale?

[Q42] Women's Rights

Recently there has been discussion about women's rights. Some people feel that women should have an equal role with men in running business, industry, and government. Suppose these people are at one end of the scale at point A.

Others feel that a woman's place is in the home. Suppose these people are at the other end, at point G.

And of course, some other people have views somewhere in between, at points B, C, D, E, or F.

- (a) Where would you place yourself on this scale, or haven't you thought much about this?
- (b) Where would you place the Conservative Party on this scale?
 - (c) Where would you place the Labour Party on this scale?
- (d) Where would you place the Liberal Democrats on this scale?

[Q55a] Blue Collar

Do you ever think of yourself as belonging to any particular class? If YES: Which class is that?

- 1. Yes, middle class.
- 2. Yes, working class.

[Q919b] Homeowner: Does your household own or rent this accommodation?

[Q921] Family Income: Which of the letters on this card represents the *total* income of your household from *all* sources?

1. £3,999 or less	9. £20,000-22,999
2. £4,000-5,999	10. £23,000-25,999
3. £6,000-7,999	11. £26,000-28,999
4. £8,000-9,999	12. £29,000-31,999
5. £10,000-11,999	13. £32,000–34,999
6. £12,000–14,999	14. £35,000–37,999
7. £15,000–17,999	15. £38,000 or more
8. £18,000–19,999

Political Parties and Foreign Aid

JEAN-PHILIPPE THÉRIEN and ALAIN NOËL Université de Montréal

The influence of partisan politics on public policy is a much debated issue of political science. With respect to foreign policy, often considered as above parties, the question appears even more problematic. This comparison of foreign aid policies in 16 OECD countries develops a structural equation model and uses LISREL analysis to demonstrate that parties do matter, even in international affairs. Social-democratic parties have an effect on a country's level of development assistance. This effect, however, is neither immediate nor direct. First, it appears only in the long run. Second, the relationship between leftist partisan strength and foreign aid works through welfare state institutions and social spending. Our findings indicate how domestic politics shapes foreign conduct. We confirm the empirical relevance of cumulative partisan scores and show how the influence of parties is mediated by other political determinants.

here is no lack of pleas for a better integration of domestic factors into the analysis of foreign policy and international relations. The idea that international politics is shaped by the internal politics of states stems from an old, diversified, and enduring tradition of international relations (Waltz 1954). In recent years, this tradition has been rejuvenated by the growing recognition that the most fundamental transformations of our time cannot be explained by international factors alone (Kratochwil 1993, 63). A broader, more historical perspective on domestic politics is required, and for this we must turn to comparative politics. In this article, we use the literature on political parties and on the welfare state to assess, with a structural equation model, the effect of partisan orientations and domestic institutions on foreign aid.

The growing integration of the world economy has raised questions on the policy options left to national governments and on the relevance of partisan politics (Kurzer 1993, 252; Scharpf 1991, 244–8). Recent studies have reaffirmed the influence of partisan orientations on domestic public policy, but the debate remains open on the magnitude and the nature of this influence (Boix 1998; Clayton and Pontusson 1998; Garrett 1998a, 1998b; Rhodes 1996; Swank 1998). The idea that "parties make a difference" appears even more problematic for international relations. After Ernst B. Haas's (1958) classical work on European integration, few studies of the domestic sources of foreign policy have dealt with political parties in a systematic, com-

Jean-Philippe Thérien and Alain Noel are associate professors of Political Science, Université de Montréal, C.P. 6128, succursale Centre-ville, Montréal, Québec H3C 3J7.

An earlier version of this article was presented at the 1996 Annual Convention of the International Studies Association in San Diego. We also benefited from comments made at a number of seminars held at the Université du Québec à Montréal, McGill University, Reed College, the University of Bath, and the University of Ottawa. We are grateful to Nicolas Blouin, Bernard Cantin, Sébastien Dallaire, Nimà Machouf, and Alain Marchand for their work as research assistants. We also thank Antoine Aubin, André Blais, Claire Durand, John Gelissen, Nell Gilbert, Fiona Kay, Pierre Martin, Jim Midgley, T. V. Paul, Cranford Pratt, Ian Robinson, John Stephens, and Guillaume Thérien for their much appreciated help. parative manner (Holsti 1991, 192–3; Risse-Kappen 1991; Simmons 1994, 281). Traditionally understood as above parties, beyond the water's edge, foreign policy has been portrayed either as consensual or as idiosyncratic, more associated with leaders and circumstances than with partisan orientations (Nincic 1992, 90–1). A few exceptions concern issues for which policy is easier to measure, such as defense spending (Chan and Mintz 1992), international trade (Verdier 1994), and foreign aid (Noël and Thérien 1995), but even in these cases, much remains to be done.

This article starts from the idea that parties and institutions matter, not only domestically but also with respect to foreign policy. We argue that, at least for development assistance, parties make a difference. Leftist parties, in particular, have an effect on a country's level of foreign aid. This influence, however, works in the long run, through the mediation of welfare institutions and social spending. In other words, partisan politics plays a role, but it does so within the broader and more enduring context of domestic structures. Beyond the immediate issue of foreign aid, our findings contribute to the larger debates on the relevance of parties and on the domestic sources of foreign policy, because we help specify the effects of partisan politics and the channels that lead from domestic conflicts to foreign conduct.

In the first part of the article we survey the literature on political parties and foreign aid, and we find that existing studies are inconclusive. In the second part we propose a new theoretical model, from which we derive two hypotheses regarding the long-run influence of social-democratic and Christian-democratic parties on development assistance. The third and fourth parts present the data used in this analysis and the results we obtained with a LISREL structural equation model. In the last part we draw on comparative politics to explain the different national cases. More specifically, we show how partisan orientations make a difference in foreign aid policy and how their effect is mediated by other institutional variables. In the conclusion we discuss the implications of this study for the broader debate on the integration of domestic and international politics.

STATE OF THE ART

The literature on the domestic foundations of foreign policy has focused on mass and elite opinion, without much reference to domestic institutions and collective political actors (Hudson and Vore, 1995, 219; Risse-Kappen 1991, 484-5). More recent studies have dealt with various nongovernmental actors, such as interest groups, multinational corporations, and the media, but surprisingly little has been done on political parties (Gerner 1995, 21). Case studies exist, particularly on the workings of multiparty coalition governments, but few analyses provide a comparative perspective (for an exception and discussion see Hagan 1993, 26–31; 1995, 137). This neglect is surprising given the centrality of political parties in the government of liberal democracies, their importance in the study of public policy, and their acknowledged role in some key foreign policy changes (Blais, Blake, and Dion 1993, 40; Hagan 1994, 139).

Most of the studies on the parties-aid relationship are qualitative, but a few have used quantitative methods. Qualitative studies suggest political parties have an influence on foreign aid. From his seminal comparative study of "like-minded countries" (Canada, Denmark, the Netherlands, Norway, and Sweden), Olav Stokke (1989, 281) concludes that the efforts made to maintain the question of foreign aid "above party politics" do "not imply... that the political colour of a government does not matter." Parties of the Left, in particular, are expected to be more generous toward Third World countries than parties of the Right. This commonsensical proposition seems corroborated by a number of observations. As Stokke explains, the Nordic countries, where social-democratic parties have been in power for a long time, rank among the leading development assistance contributors. Conversely, countries such as Japan and the United States, where social-democratic parties are absent or have virtually no influence, maintain a foreign aid effort constantly below the Organization for Economic Cooperation and Development (OECD) average based on the percentage of a nation's GNP. In the 1980s, these observations were reinforced by the contrasted evolution of France and the United Kingdom. With the Socialists in power, France increased its assistance, just as the Conservative government of Margaret Thatcher reduced its aid budget (Adda and Smouts 1989, 34-5; Byrd 1991, 60-1). In a major study, David H. Lumsdaine (1993, 163) has reaffirmed the "Left-does-matter" thesis for the entire community of aid donors: "Parties with strong socialist or domestic redistributive concerns . . . strengthened aid when in power, while conservative governments tended to retrench." According to him, governments project their domestic orientations on the international scene. More committed to equality and social spending at home, parties of the Left are expected to be predisposed to spend more on development assistance as well.

Although with much less emphasis, qualitative analyses also suggest that, like religious groups, Christian parties tend to be favorable to development assistance

(Cooper and Verloren van Themaat 1989, 82; Lumsdaine 1993, 158; Pratt 1989, 195). Drawing a parallel between the social principles supported by Christian democrats and social democrats, Stokke (1996, 22) argues that the norms in which Christian democracy is rooted are conducive to a generous stance toward the Third World because "these norms are universal and do not stop at the borders of nation states." In countries such as Sweden, Norway, Denmark, and the Netherlands, religious parties or party factions have indeed mobilized behind foreign aid (Kärre and Svensson 1989, 263; Södersten 1989, 189; Stokke 1989, 282). Other cases, however, indicate the situation is far from clear-cut. In Italy, for instance, Christian democrats have been dominant for the entire postwar period, but the government has maintained one of the lowest foreign aid contributions among OECD countries. Overall, in the qualitative literature, the effect of religious parties on aid policy does not appear as well established as that of leftist parties.

Quantitative studies of the parties-aid relationships have dealt only with the influence of leftist parties on development assistance and, even on this question, they appear much less conclusive than qualitative studies. Louis-Marie Imbeau (1988, 1989) examined 17 countries over the 1963-81 period, using the percentage of votes obtained by each party as an indicator of party strength. He found that "more left-oriented countries give more aid" but acknowledges the fragility of his results (1989, 109). Of the four years considered by Imbeau, only two (1976 and 1981) yielded a significant and positive measure of association; one year (1966) even presented a negative correlation between the power of the Left and the level of foreign aid. With such "ambiguous" results, Imbeau (1989, 157) finally concluded that "what is important seems not to be which ideology is present, but rather how it is translated into policy." For him, the role played by parties must be understood as complementary to other factors, such as inertia, donors' interests, and donors' perceptions of recipients' needs (p. 155).

Marijke Breuning (1995) also suggests there is no simple, straightforward relationship between partisan orientation and development assistance. Her content analysis of parliamentary debates on foreign aid in three countries (Belgium, the Netherlands, and the United Kingdom) shows, for 1975–91, that "the political affiliation of the minister has the potential to affect the debate in Parliament as a whole"; yet, the same analysis indicates that "whatever agenda-setting the ministers do... is not determined by their party affiliation" (1995, 246). Breuning's conclusions reinforce the traditional view of foreign policy as standing beyond partisan differences, since she finds "a consensus about the state's role in the foreign assistance issue area" (p. 252).

Our own recent study of 16 countries for six of the years between 1965 and 1988, supports the skepticism of Imbeau and Breuning. Using the difference between the percentage of seats in the cabinet held by parties of the Left and Right as an indicator of leftist power, we found no correlation between the parties in power and

the level of foreign aid (Noël and Thérien 1995). For three of the six years considered, we even obtained negative correlations. We suggested, however, that further tests should be conducted, given the plausibility of the partisan hypothesis, established by a host of qualitative observations and studies (p. 532).

The contrast between qualitative studies that agree parties matter and quantitative ones that fail to confirm this idea is striking. In these circumstances, a lack of quantitative support should not lead us to dismiss hastily the conclusions of qualitative assessments. The hypothesis of a relationship between partisan orientation and development assistance may have been tested the wrong way. There are many indicators of partisan strength and a variety of models to capture the relationship between parties and policy.

THEORETICAL MODEL

There are at least three problems with the conventional representation of partisan influence. First, because the usual conceptualization and measurement of partisan variables assume governments have immediate effects, they fail to capture the long-run dimension of partisan politics. Second, most of the quantitative studies neglect the importance of Christian democracy, the significance of which is underlined in recent studies of European politics. Third, the standard understanding of partisan influence looks only at direct effects, assuming there is always a simple, unmediated relationship between parties and public policies. Our theoretical model addresses these three issues in order to account better for the parties-aid relationship.

The first problem concerns the time frame of partisan influence. The usual indicators of partisan strength measure, in various ways, the distribution of power in a given year. This short-term perspective may well explain why quantitative studies have failed to confirm the widespread observation that, "in country after country, the politicians and political parties that strongly advocated aid were those on the left" (Lumsdaine 1993, 139). The effect of social democracy on public policy is likely to be a long-run phenomenon, felt only after a party has been in power for many years. In foreign as in domestic policy, patterns tend to be established at critical junctures and change only incrementally thereafter. The dominance of a party over a long period probably matters more than the distribution of power at any moment. This is what Evelyne Huber, Charles Ragin, and John D. Stephens (1993) demonstrate in their work on the welfare state. Using cumulative indicators of partisan power, these authors obtain more conclusive results than previous studies on the effect of parties (pp. 724-5). Accordingly, our model of the partisan determinants of development assistance includes variables that measure the cumulative presence of parties in power and compares them to the more conventional single-year indicators.

The second problem concerns the role of religious parties. As explained above, the specific contribution of Christian-democratic parties to foreign aid policy has been recognized in the qualitative literature but omit-

ted in quantitative studies. Until recently, the situation was similar in the comparative study of the partisan foundations of the welfare state. Understood as historical anomalies or as functional equivalents of socialdemocratic or conservative parties, Christian-democratic parties have been largely neglected, except in case studies (Kalyvas 1996, 1-7; van Kersbergen 1995, 1-2, 23-9). Recent works, however, have established the distinctive and coherent character of Christian democracy as a centrist phenomenon, characterized by its emphasis on social mediation and moderate policies (Kalyvas 1996, 263–4; van Kersbergen 1995, 28–9). Christian-democratic parties have constructed distinct welfare states that institutionalize their conceptions, inspired by religious ideas, of social capitalism and societal accommodation (van Kersbergen 1995, 2-5, 230-1). Qualitative studies suggest similar dynamics have been at play with respect to foreign aid. Two political traditions, insists Stokke (1996, 22-4), have shaped foreign aid policies. The first derives from the social-democratic understanding of solidarity, and the second stems from the Christian-democratic notion of brotherhood. A model that seeks to explain the effect of parties on development assistance should include a variable for Christian democracy, along with the more conventional variable measuring social-democratic power. This new variable should also, of course, be considered in the long run in order to capture the effect of Christian-democratic cumulative power.

Finally, quantitative studies assume a direct, unmediated relationship between partisan orientation and foreign aid. This assumption is associated with the conventional idea that parties have an independent influence on each policy area; they will implement their platform section by section, in a straightforward fashion. This understanding of public policy as a set of distinct items may be reinforced by the use of multiple regression techniques to test the assumed relationships. Regressions may suggest the presence of indirect effects, but they provide an image of policy as determined by a set of independent variables, whose effects are additive more than interactive. "The multiple regression equation," write Schumacker and Lomax (1996, 38), "is by definition additive and does not permit any relational specification of variables. This limits the potential for variables to have direct, indirect, and total effects on each other."

The historical institutionalist approach to comparative politics offers a useful theoretical corrective. Indeed, beyond their claim that institutions matter, historical institutionalists seek to "demonstrate the relationships and interactions among a variety of variables in a way that reflects the complexity of real political situations" (Thelen and Steinmo 1992, 13). Their aim is to develop "more explicit theorizing on the reciprocal influence of institutional constraints and political strategies and, more broadly, on the interaction of ideas, interests, and institutions" (p. 14). In this perspective, the model we propose indicates how the interactions among partisan and other institutional variables may account for foreign aid. More specifically, this model associates partisan power with social-

democratic welfare state institutions and social spending, two variables previously identified as significant in the explanation of foreign aid.

Our model of the parties-aid relationships is novel in three major ways. First, it considers partisan cumulative power, assuming partisan effects are a long-run phenomenon. Second, it includes a variable for Christian democracy to integrate an important insight of the qualitative studies on foreign aid and of the recent literature on the welfare state. Third, it starts from the idea that partisan effects may be indirect and incorporates two potentially important intervening variables, social-democratic welfare state institutions and social spending. Combined with what is already known about parties, the welfare state, and foreign aid, these three propositions yield two hypotheses:

Hypothesis 1. Leftist cumulative power has a positive effect on foreign aid, through the influence of socialist attributes and social spending.

HYPOTHESIS 2. Religious cumulative power has a positive effect on foreign aid, through the influence of social spending.

In the first hypothesis, the logic at work is the following. When they hold power for a long time, parties of the Left tend to institutionalize social-democratic welfare state principles and practices, which are themselves the best predictors of a country's foreign aid effort. The second hypothesis derives from the observation that Christian-democratic cumulative power favors high levels of social spending, and a country's social spending is strongly associated with its foreign aid (Huber, Ragin, and Stephens 1993; Noël and Thérien 1995).

Methodologically, our hypotheses involve a series of interrelated effects that can best be represented and tested with a structural equation model. Theoretically, our approach stems from the general idea that, for political parties, the road to power requires the construction of social bases, a continuous process that involves transforming the state to institutionalize various forms of social solidarity and class alliances (Esping-Andersen 1985, 37-8). In the process, certain ideas and principles prevail and are entrenched for long periods, during which they shape not only the actors' strategies but also their goals and discourses, often in more than one policy area (Thelen and Steinmo 1992, 9). This is why foreign aid is closely linked to the domestic social policies that parties build over time.

THE DATA

Our model includes one dependent variable (Foreign Aid), two independent variables for leftist and religious party strength (measured in two different ways), and two additional independent variables that have proved important in accounting for a country's development assistance commitment (Socialist Attributes and Social

Spending).¹ The analysis is comparative and cross-sectional. It includes the most important aid donors, 16 of the 20 countries belonging to the OECD Development Assistance Committee (DAC), for two different years, 1980 and 1991.²

The dependent variable, foreign aid, is measured with OECD data on official development assistance (ODA) as a percentage of GNP (OECD, Development Co-operation, various years).3 With respect to partisan orientation, we use two types of indicators to measure the strength of leftist and religious parties. Both derive from the comparative literature on the influence of political parties and are based, with some adjustments, on the classification of Castles and Mair (1984). The two types of indicators are very different theoretically and empirically. The first type (Leftist Power and Religious Power) reflects the distribution of partisan power in a given year. Leftist power is borrowed from Blais, Blake, and Dion (1993, 48) and measures "the difference between the percentages of seats in the cabinet held by parties of the left and of the right." We calculated religious power in a similar fashion, as the percentage of cabinet seats held by religious parties, for each of the two years under study.

The second type of indicators (Leftist Cumulative Power and Religious Cumulative Power) was developed by Huber, Ragin, and Stephens (1993) and measures leftist and religious party power over the years. Unlike the first type of indicators, which give discrete values for each year considered, the second type provides scores that are additive from 1946 onward. The measure of party strength is also somewhat different. Whereas leftist and religious power consider the percentage of seats in the cabinet, cumulative leftist and religious power use the fraction of leftist/religious seats in parliament of all governing parties' seats (Huber, Ragin, and Stephens 1993, 725). The key difference, of course, concerns the instantaneous effect expected with the first type of indicators, compared to the stress on cumulated power associated with the second type. We have argued above that cumulative indicators of partisan power appear preferable because they better represent the historical strength of the different parties. These indicators may be unstable in the early years, when a shift in government can modify a country's

¹ We also considered the rate of unemployment and the consumer price index, two independent variables that reflect the economic context within which countries make their development assistance decisions. The relationship between the rate of unemployment and foreign aid, however, is not significant (r = 0.02 in 1980 and r = 0.04 in 1991). The relationship between the consumer price index and foreign aid also proves nonsignificant (r = 0.12 in 1980 and r = 0.01 in 1991).

² In 1991, these 16 countries provided 94.3% of total world aid (OECD 1995).

The choice of this measure can be justified easily. First, it constitutes the standard indicator in the literature on foreign aid. Second, other measures of a country's commitment to development assistance—the multilateral character of the country's contribution, the grant-loan ratio, or the proportion of aid that is untiled—tend to correspond to its overall level of foreign aid (Lumsdaine 1993, 41–2, 268). Third, this indicator is politically meaningful since the mternational community expresses aid targets in these terms (Opeakin 1996, 22).

	1980			1991		
	Socialist Attributes	Social Spending	Foreign Aid	Socialist Attributes	Social Spending	Forelgn Aid
LeftIst power	.26	.13	.08	.14	.48*	.31
Religious power	.17	.58*	.10	.22	.17	.22
LeftIst cumulative power	.76**	.27	.52*	.70**	.43	.66**
Religious cumulative power	31	.56*	06	28	.32	−.19
Socialist attributes		.27	.77**		.52*	.88**
Social spending			.62*			.73**

score markedly, but they become stable for the later years that we consider in this cross-sectional study (1980 and 1991). In any case, the comparison of year-to-year and cumulative indicators of partisan power should help clarify their respective merits.

We had the opportunity to work with data sets provided by Blais, Blake, and Dion and by Huber, Ragin, and Stephens. The former were used as expanded and corrected in the authors' most recent analysis (Blais, Blake, and Dion 1996, 515). The latter, which ended in 1988, were updated to 1991 with the help of data compiled in the European Journal of Political Research (Koole and Mair 1993; Woldendorp, Keman, and Budge 1993).

The two additional independent variables (socialist attributes and social spending) were established as important domestic determinants of foreign aid in a previous study (Noël and Thérien 1995). We adopt the same definitions and sources. Socialist attributes are represented by Gøsta Esping-Andersen's scores (1990), which capture the degree of program universalism in a country's welfare state. Social spending is measured by total social transfers as a percentage of GNP. Transfers are the sum of the OECD National Accounts data (various years) for "social security benefits" and "social assistance grants."

The analysis is cross-sectional and is conducted for two years, 1980 and 1991. These two years are distant enough and yet sufficiently recent to speak of mature welfare states and of a fully established international aid regime (Noël and Thérien 1995, 529). The first year is the one for which Esping-Andersen's scores are compiled. The second is the most recent year for which a complete data set was available. Following other welfare state scholars, (Janoski 1994, 56; Stephens 1996), we assume the socialist attributes scores compiled for 1980 held constant to 1991. Strictly speaking, this is probably not true. Welfare states have changed, and some countries have abandoned earlier commitments to universality (Pierson 1994). Overall, however,

4 We are grateful to the authors, who shared their data with us and offered helpful advice.

it seems fair to speak of a "frozen welfare state landscape" (Esping-Andersen 1996, 24). Institutions change slowly, welfare state institutions, in particular, have proved particularly resilient in the face of important challenges (Pierson 1996).

RESULTS

To explore the various relationships among our different variables, we start with bivariate and multivariate estimations and then develop a structural equation model. First, we must compare the two types of indicators of partisan strength. This is done in Table 1, which presents the relationship between partisan orientation and foreign aid for 1980 and 1991 as well as the other bivariate relationships necessary to build our model

The first indicator in Table 1, leftist power, represents the strength of the Left in the cabinet in a given year. It does not account significantly for foreign aid. We obtained the same result for 1965, 1970, 1975, 1980, and 1988, and concluded that "while parties may matter in the formulation of aid policies ... left-right partisan orientations do not generate a statistically significant explanation of foreign aid behavior" (Noël and Thérien 1995, 532). The second indicator of leftist party strength, however, yields very different results. Leftist cumulative power, the indicator borrowed from Huber, Ragin, and Stephens, is strongly and positively associated with foreign aid for both 1980 and 1991. This result reconciles the quantitative evidence with qualitative accounts that stress the role of political parties in development assistance policies. It also indicates how partisan influence operates.

Parties do not have the year-to-year influence on foreign aid suggested by an indicator such as leftist power; their influence is felt over the years, as power is cumulated. This mechanism operates in other issue areas as well. Leftist cumulative power, for instance, "shows significant correlations with measures of income distribution and redistribution" (Huber, Ragin, and Stephens 1993, 740). This indicator embodies an understanding of power and public policy that is more structural than pluralist. What matters, in this perspective, is not simply the formation of a government but the exercise and maintenance of power. A party's influence is directly related to its capacity to govern for long periods. This understanding of partisan influence

⁵ Esping-Andersen gives a score of 0 when 60% or less of the population between age 16 and 65 is covered by a sickness, unemployment, or pension program, a score of 2 when coverage is between 61% and 85%, and a score of 4 when more than 85% of the working-age population is covered. Programs are scored individually, and the measure of socialist attributes is the sum of these scores for the three programs (Esping-Andersen 1990, 73–8).

seems fitting for a study of development assistance, since the level of a country's foreign aid does not change frequently or abruptly.

Table 1 also shows there is no correlation between the two indicators of religious partisan strength and foreign aid. Bivariate analysis, however, offers only a partial view of the relationships involved. Religious cumulative power, for instance, may not be correlated with foreign aid, but in 1980 it was a significant determinant of social spending, which is itself associated with foreign aid. Even the leftist cumulative power-aid relationship may not be as straightforward as suggested in Table 1. In a multiple regression including other determinants of foreign aid identified in the theoretical model, that relationship becomes nonsignificant. Table 2 presents the results of this regression for 1980 and 1991.

By themselves, socialist attributes and social spending provide a good explanation of foreign aid (adjusted R^2 of .74 in 1980 and .86 in 1991). As is clear from Table 2, the addition of leftist and religious cumulative power does not significantly improve these results (adjusted R^2 of .75 in 1980 and .86 in 1991).6 Our aim, however, is not simply to account for foreign aid in the most parsimonious way; we want to elucidate the role played by political parties, directly or indirectly.

Consider the effect of leftist parties. We know from Table 1 that their cumulative power is associated with foreign aid. When that power is combined with socialist attributes and social spending in a multiple regression, however, it becomes nonsignificant. This is consistent with our hypothesis about the role of social-democratic parties and institutions: The relationship between leftist cumulative power and foreign aid seems to be a

typical case of developmental sequence, with socialist attributes and social spending as intervening variables (Asher 1976, 18).

In the case of religious parties, the situation is more complex. As is shown in Table 1, the relationship between their cumulative power and foreign aid is not significant. When social spending is added as an independent variable in a multiple regression containing only these two variables, however, religious cumulative power becomes significant, but the relationship is negative (Beta of -.60 in 1980, p < .05, and -.47 in 1991, p < .01). Hence, Christian-democratic power not only has no direct effect but also, when social spending is held constant, even works against foreign aid. While religious cumulative power does increase social spending, which is associated with increased foreign aid, it appears that any effect of religious parties on foreign aid is unimportant or even negative.

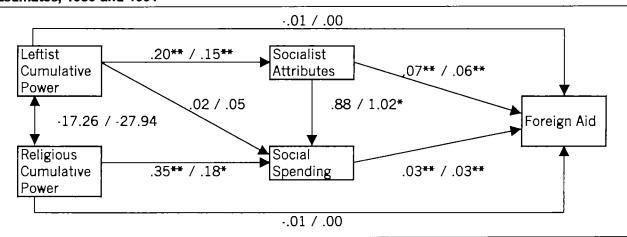

For a better understanding of the indirect and total effects of parties on foreign aid, we will use a structural equation model. A technique derived from multiple regression and path analysis, structural equation modeling makes it possible to integrate into a single framework the two paths that may lead from political parties to foreign aid and to estimate simultaneously all the possible effects. This technique also provides an assessment of the overall explanatory power of the combined variables. Covariance matrices were analyzed, and the parameters of the models were estimated with a maximum likelihood fitting function (LISREL 8.12). Figure 1 presents the complete model, with the results for both years under study.

This structural model is adequate, and it clarifies the role of leftist and religious cumulative power in explaining foreign aid. The most commonly used indices of model fit are satisfying. The probability level of the chi-square statistic (.26 for 1980 and .39 for 1991) suggests a good fit (Jaccard and Wan 1996, 86). The goodness of fit index (GFI), the nonnormed fit index (NNFI), and the incremental fit index (IFI) also indicate that our model is consistent with the data (Marsh, Balla, and Hau 1996; Tanaka 1993). We also tested the similarity of the 1980 and 1991 models, following Bollen's (1989, 355-9) testing hierarchy. We started with the least restrictive hypothesis, that both models have "the same form, without restricting any of the nonfixed parameters to have the same values across groups" (Bollen 1989, 358). The results indicate an excellent fit to the data ($\chi^2 = 1.998$, df = 2, and p =.368). More restrictive hypotheses also show a good fit. Even in the most restrictive case, with all parameter matrices constrained to be equal, the fit to the data is excellent ($\chi^2 = 9.664$, df = 16, and p = .884). A comparison of the most and the least restrictive hypotheses gives results consistent with the assumption that the same logic operates in both years ($\chi^2 = 7.666$, df = 14, and p = .906). With all the parameters stable over time, the 1980 and 1991 models appear equivalent.7

⁶ To make sure one or two cases were not driving the findings, we screened the data to detect univariate and multivariate outliers. Univariate outliers were inspected using standardized scores for each variable, and multivariate outliers were sought with Mahalanobis distance. No outliers were identified; the largest score for univariate outliers was 2.24, and the smallest probability for multivariate outliers was p = 0.103. Partial residual plots also were examined, and no departure from linearity was found.

⁷ Classical models of structural equations with observed variables assume that "endogeneous and exogenous variables are directly

FIGURE 1. Causal Relationships among Hypothesized Predictors and Foreign Aid, with LISREL Estimates, 1980 and 1991

Note: Figure entries are unstandardized coefficients, p < .05, p < .01. Chi-equare and the goodness of fit index (QFI) are indicators of overall fit. They estimate how well a hypothesized model fits the observed model derived from the data (Yadama and Pandey 1995, 51). Chi-equare is a test of the null hypothesis and should be noneignificant. QFI measures "the relative amount of variances and covariances jointly accounted for by a model" (p. 53). incremental fit indices such as the nonnormed fit index (NNFI) and the incremental fit index (IFI) "compare a sense of nested covariance structure models" (pp. 61-2). NNH corrects for sample size and IFI for degrees of freedom.

1 25 with 1 degree of freedom; p=26 (1980) 74 with 1 degree of freedom; p=.39 (1991)

QFI. .97 (1980) and .98 (1991) NNFI .94 (1980) and 1 06 (1991)

1.00 (1980) and 1.00 (1991)

This structural equation model lends support to our first hypothesis, regarding leftist orientation, but not to the second, on religious parties. A country's development assistance effort is shaped by socialist welfare state attributes and government social spending, two variables that are themselves associated with the influence that social-democratic parties have established over the years. Contrary to what is often suggested by casual observations in the literature on foreign aid, however, religious parties do not seem to have an influence on development assistance. Table 3 summarizes the effect of each independent variable on foreign aid by providing its unstandardized total effect.

In both years, the total effect of leftist cumulative power is significant, as are the total effects of socialist attributes and social spending. The effect of religious cumulative power is weaker and nonsignificant. Overall, the pattern is the same for 1980 and 1991, except

observed with no measurement error" (Bollen 1989, 80; see also Kelloway 1998, 82). Since our variables are likely to contain random and systematic errors, however, we reestimated the models assuming measurement error. There is no information in the literature about the reliability of the measures we used, but it seems reasonable to assume that socialist attributes have the lowest rehability, followed by leftist and religious cumulative power, then by social spending and foreign aid Four variants of the model were estimated, assuming a range of reliability from 0.5 to 0.7 for socialist attributes, from 0.6 to 0.7 for partisan variables, and from 0.7 to 0.9 for social spending and foreign aid. In each variant, for both years, it is impossible to evaluate the effect of measurement errors on the model because of negative residual variances and an R2 larger than one. Furthermore, the number of iterations necessary for the models to converge is too high for the solutions to be valid. No conclusion can be drawn about the potential effect of measurement errors on the models.

that the total effect of leftist cumulative power on foreign aid is higher in 1991.

Our model helps understand the role played by partisan orientation in shaping foreign aid policies. The level of a country's development assistance is significantly linked, through socialist welfare state attributes and government social spending, to the historical power of the Left but not to that of Christian-democratic parties. The effect of social-democratic parties is neither immediate nor prevailing nor direct. First, their effect appears only over time, when we use indicators of cumulative partisan power. Second, their direct effect is not as strong as that of welfare state attributes and social spending; in multiple regressions including these two variables, leftist cumulative power is not significant. Third, the paths that lead from partisan strength to foreign aid work through a country's welfare institutions and practices. These more distant but very real relationships explain the stress placed on parties by qualitative studies and the absence of confirmation in quantitative analyses.

FROM THE MODEL TO THE CASES

To examine more specifically the relationship between leftist cumulative power and foreign aid, it is useful to consider three groups of countries, categorized according to the strength of their social-democratic tradition. Table 4 presents these three categories, with each country's leftist and religious cumulative power and social spending for 1991, socialist attributes for 1980, and an average of foreign aid spending levels for 1971–91.

From 1946 to 1991, Austria, Denmark, Norway, and Sweden stand out as the only countries in which the Left has been in power for the equivalent of more than half the time. For the last three, the pattern is clear. Social democrats prevailed during most of the period; all three established typical socialist welfare institutions, maintained high levels of social spending, and have a strong record as among the most committed aid donors of the OECD. These countries, plus the Netherlands, are the only ones to reach the 0.7% of GNP target set by the international community.

Austria seems to be an odd case. Despite a strong social-democratic party in power for many years, it has a foreign aid record comparable to that of countries in which the Left is weak or absent, such as Italy, Japan, and the United States. The explanation lies in welfare state institutions. Austria's welfare state, established by conservative governments and left essentially untransformed by the Austrian Socialist Party (SPÖ), is typically conservative, with almost none of the universalist programs that characterize social-democratic institutions (Esping-Andersen 1990, 53, 60; Esping-Andersen and Korpi 1984, 194). Alone in power from 1970 to 1983 and then involved in coalition governments for most of the remaining years of the period, the SPO has pursued a moderate, catch-all strategy, more akin to that of centrists than to that of hegemonic social democrats (Gerlich 1987, 85–6; Kitschelt 1994, 178). In power for many years, the Austrian socialists governed in a conservative fashion; they did not establish social-democratic institutions and did not commit their country to a generous foreign aid policy.

In Australia, Belgium, Finland, France, Germany, the Netherlands, Switzerland, and the United Kingdom, the Left did not prevail over the 1946-91 period, but it played a role—whether in power alone or in coalition—for the equivalent of ten years or more (9.7) in the Netherlands). Most of the countries in this middle cluster have an average score for socialist welfare state attributes, which means that they have institutionalized universality in some of their social programs, such as health care. Accordingly, they tend to have average development assistance contributions. With a strong but not predominant Left, most of these countries integrated social-democratic elements into their welfare institutions and made substantial efforts to increase their aid budget. In this group, Switzerland and the Netherlands stand out for their atypical aid behavior.

Switzerland appears less generous than expected, given the cumulative power of its leftist parties and its average score for socialist welfare attributes. This result can be explained by the nature of the Swiss party system. The average cumulative score of the Swiss socialists results from their regular representation in coalition governments; this representation, however, is always contained within alliances that limit ideological conflicts (Kerr 1987, 119–21). In this context, explains Kerr (p. 140), "the Swiss parliament appears more to register decisions taken elsewhere—be it at the polls or in antechambers of the administration—than to shape coherent policy in response to recognizable party programmes." The socialist presence in government has not challenged the dominant conservative ideology of

the country (p. 182). Despite its average socialist attributes, Switzerland is a welfare laggard. One of the least redistributive countries of the OECD, it contributes relatively little to international aid (Castles and Mitchell 1992, 22; Katzenstein 1984, 111).

The Netherlands, in contrast, is more generous than expected. With the lowest leftist cumulative power score in the middle cluster, this country has a foreign aid contribution comparable to that of the Scandinavian countries, well above the 0.7% international objective. Again, explanations can be found in the party system. In the 1950s, social policy cemented the alliance between the Catholic Peoples' Party (KVP) and the social democrats (Partij van de Arbeid). Taking advantage of favorable economic conditions, these parties laid the foundations of a generous welfare state. These foundations were not challenged with the demise of the "Roman-red" coalition (van Kersbergen 1995, 132-3). On the contrary, in the 1960s, faced with electoral decline and confronted by radicalized Catholic trade unions, the KVP allied with the Protestant parties (Antirevolutionary Party and Christian Historical Union), and together they pursued social-democratic policies to preserve their power against the Left in a competitive and fragmented political space. To "bolster electoral support," the confessional parties "became the advocates of the adoption of universal programs that provide more generous benefits than anything the Labor party strove to realize" (Cox 1993, 169). Against the opposition of a Left concerned by costs, the religious parties, "whose ideology espouses a parochial version of the limited state," became "responsible for one of the biggest welfare expansions in the world" (pp. 218-9). In a country in which the Left was not very strong, socialist welfare state institutions were promoted by religious parties and, along with them, a political situation conducive to a remarkable expansion of foreign aid.

In the last group are countries in which the Left is weak or absent: Canada, Italy, Japan, and the United States. The results for the last three are straightforward. With a weak Left and almost no socialist welfare state attributes, these countries are predictably among the less generous aid donors. The case of Canada appears more puzzling, since it has average foreign aid levels, which themselves correspond to average socialist welfare state attributes. The situation is somewhat akin to that of the Netherlands, with a centrist party pushed by the Left to adopt reforms. From 1945 to 1975, when the contemporary Canadian welfare state was built, the New Democratic Party (NDP) was never in power at the federal level, but it remained a significant competitor for the dominant Liberal Party. The NDP was also in power at the provincial level, where some of the major social reforms originated. In this context, the Liberal Party institutionalized universal social programs and created a welfare state favorable to the development of foreign aid (Thérien and Noël 1994, 548).

With religious parties in these various countries, the situation appears quite different. The Christian democrats' commitment to redistribute income abroad remains well below that of the social democrats; when we control for social spending, religious parties even work against foreign aid. As van Kersbergen (1995, 204, 231) explains, Christian democrats built a distinct type of welfare state regime, which emphasizes societal accommodation and embodies a specific understanding of social justice. This welfare state, however, can vary significantly across countries, according to the competitive environment faced by Christian democrats. In the Netherlands, in a highly competitive situation, confessional political forces contributed to the development of a universalist welfare state and raised social spending; accordingly, they adopted a generous stance toward the Third World.

In Italy, in contrast, Christian-democratic dominance did not foster universalist social policies or foreign aid. This was not for lack of power: "No single party in any Western democracy has been able to become so politically dominant in the first decades after the Second World War as the Italian Democrazia Cristiana" (van Kersbergen 1995, 59). This political force did not permit many social policy innovations because reform-minded Christian and social democrats remained isolated within their parties and were unable to count on the strong communist movement to support gradual change. The result was a minimalist, fragmented welfare state, which was "more an effect of the incapacity to act and to reform than the result of intentional intervention" (van Kersbergen 1995, 162-7). Not surprisingly, the impulse behind development assistance also remained weak (Alessandrini 1984).

The paths that lead from leftist cumulative power to socialist welfare state attributes and social spending, and then to foreign aid, account for much of the cross-country variance in development assistance levels. Few exceptions can be singled out, and these can be explained by the peculiar logic of party competition in the different countries. In fact, these exceptions can help understand the interest and the limits of the variables considered and of the model we propose. While the cumulative partisan scores are useful, they are not faultless indicators of partisan power. First, adding up years of presence in coalition governments may exaggerate the real influence of a party that never governs alone and rarely prevails. The Swiss score, for example, overstates the strength of the Left in a predominantly conservative country. Second, the sum of years in power may also fail to represent the extent to which a party is or is not hegemonic. The difference between the Swedish Social Democrats and British Labour, for instance, is anchored in each party's ability to forge alliances with other political forces and to define the public policy debate. In Sweden, social democracy became hegemonic; in Britain, liberalism prevailed (Kitschelt 1994, 265; Pontusson 1988). Third, it is important to stress that there is never a perfect correspondence between partisan labels and political behavior (Kitschelt 1994, 108-9). The cases of the Netherlands and Canada remind us that different roads led to contemporary social and foreign aid policies and that, as strategic actors, political parties always retain

the capacity to go beyond the boundaries set by their own ideology.

CONCLUSION

The findings presented in this article help clarify how foreign aid is shaped by domestic politics. Our model confirms the primacy of welfare state socialist attributes and government social spending in the explanation of development assistance policies. At the same time, it shows, contrary to previous quantitative studies of the topic, that political parties do matter, not directly and in the short run, but indirectly and over the years. Our findings lend support to the intuition of qualitative studies that have long emphasized the role of partisan cleavages in the formulation of foreign aid policies. For scholars interested in parties, the model also can be useful, since it offers a new assessment of partisan effects. It confirms the empirical relevance of cumulative scores of partisanship and shows how social-democratic power operates through other political determinants.

Most international relations scholars agree that the question is no longer to determine whether domestic explanations should be integrated with international ones, but to establish exactly how this can be done (Moravscik 1993, 8). In our opinion, it is imperative to look closely at domestic conflicts and to do so with the help of the comparative politics literature. This study suggests that political parties, welfare institutions, and social spending play a significant role in the aid policy process, probably because parties and the welfare state

"render some ideas more politically influential than others" (Yee 1996, 93). As is explained in the theoretical model section, when parties hold power for a long period, they put forward specific conceptions of social justice that become established as central to a country's political debates. Foreign aid, in particular, appears strongly influenced by "the capacity of a society to accept and institutionalize nonmarket principles of income redistribution" (Noël and Thérien 1995, 549).

The exact processes through which this influence becomes effective and evolves can only be assessed with case studies. Our findings are consistent with a host of such studies, as well as with Lumsdaine's (1993, 179) observation: "The parties that supported aid were those concerned with issues of equality and alleviation of poverty, not those concerned with the free market or with military and strategic issues." The influence of these concerns is felt mainly in the long run, as parties establish their primacy in society and as their ideas become institutionalized. The partisan history of Scandinavia and Britain, for instance, has shaped these countries' public debates: "Liberalism and social democracy have been hegemonic ideological forces in the arena of political reasoning for close to a century. They have structured the political dialogue around questions of liberty and equality, individual property rights and the central government's power to intervene in the marketplace, social class and citizenship" (Kitschelt 1994, 265). We agree that such public debates matter, and we argue that they matter not only for domestic politics but also for foreign policy.

BOOK REVIEWS

Political Theory

Action and Contemplation: Studies in the Moral and Political Thought of Aristotle. Edited by Robert C. Bartlett and Susan D. Collins. Albany: State University of New York Press, 1999. 333p. \$24.95 paper.

George Klosko, University of Virginia

Inspired by the recent resurgence of interest in Aristotle among moral and political philosophers, this collection claims to address "the possibility of grounding moral and political action in some version of Aristotelian rationalism" (p. xi). The majority of authors "are united by their conviction that Aristotle, and hence reason, deserves a second hearing" (p. xiii). There are fourteen contributions, six of which were published in the 1980s and 1990s. They fall into two parts. In the first, five well-established, generally continental, scholars address the relevance of Aristotle; the second part is primarily exegetical, comprised of interpretations of aspects of Aristotle's moral and political thought.

The first set provides an overview of Aristotle's renewed relevance. Franco Volpi surveys Aristotle's influence, discussing an entire list of scholars, for the most part German. These range from Hans-Georg Gadamer, and his interest in practical reason, to Konrad Lorenz, who is interested in the biological basis of moral conduct. Volpi ultimately questions whether Aristotelian practical wisdom, removed from its metaphysical backdrop, can properly guide moral action. Hans Brunkhorst examines Hannah Arendt's claims concerning the relevance of classical republican models, criticizing her for insufficient attention to the West's Judeo-Christian heritage. In "Do We Need a Philosophical Ethics?" Ronald Beiner argues for the continuing relevance of Aristotelian contextual, practical reason, as articulated by Gadamer, against Jurgen Habermas's attempt to establish moral judgments on firm philosophical foundations. According to Beiner, the debate between these two thinkers "ultimately comes down to a question of the relative priority of theory and prudence" (p. 47). In his own brief contribution, Gadamer compares Aristotle's view on the logic of moral imperatives with the more transcendental views of Kant and Plato.

In the most ambitious contribution in this part, Richard Bodeus attempts to work out Aristotle's account of natural law as it relates to the positive law of existing regimes. Although well-known discussions of something resembling natural law are presented in the *Nucomachean Ethics* and *Rhetoric*, Bodeus argues for a view that dissociates Aristotle's "natural law" and nature. For Aristotle, he claims, nature does not provide a norm of right; rather, overriding positive law are provisions "which precisely assure the common interest in a correct regime" (p. 81).

Although of high quality, the contributions in Part 1 are far from establishing the applicability of either Aristotle or "reason" to contemporary issues. They present nothing approaching Alasdair MacIntyre's attempt to work out a defensible account of virtue, based on Aristotle's views, or Arendt's distinctive reformulation of the nature of political action. Although these authors recount attempts to work from Aristotelian perspectives, on the whole they commemorate the significance of this approach rather than demonstrate it.

In addition to contributions from the editors, the essays in

Part 2 are by David O'Connor, David Bolotin, Lorraine Pangle, Aristide Tessitore, Judith Swanson, Wayne Ambler, and Bernard Yack. These make for a mixed set. Some are highly interesting. For instance, Yack presents a stimulating account of the importance of conflict for Aristotle's understanding of political community. Scholars who approach Aristotle from a liberal perspective generally focus on Book I of Politics, looking for "a counterimage to liberalism's image of political society" (p. 289). Yack claims that the image in Book I should be interpreted in the light of the conflict-ridden accounts of political life in books III-VI. Doing so gives the lie, for example, to Arendt's celebration of the unique qualities of the Greek polis. (Yack's view is elaborated in The Problems of a Political Animal, 1992.) O'Connor explores Aristotle's rhetorical strategy in Politics. Against Aristotle's remark in Book I of the Nicomachean Ethics that an audience receptive to instruction in moral philosophy must be well brought up and so imbued with good habits, O'Connor marshals impressive evidence for a "morally minimalist" account of the audience, claiming that Aristotle actually addresses ambitious Athenian youth bent on political careers. Wayne Ambler pursues the unpromising task of comparing views of Thrasymachus and Aristotle on the role and responsibilities of political leaders, but he emerges with an interesting account of what Aristotle means by the "common advantage," which distinguishes good and corrupt political regimes.

Several authors try too hard to overturn established interpretations, often combing texts for hidden meanings. For instance, Aristide Tessitore presents a revisionist account of Aristotle's portrayal of Socrates. Although Aristotle dismisses the views of Socrates on akrasia (moral weakness) outright in Book VII of the Nicomachean Ethics and is similarly critical in other contexts, Tessitore holds that Aristotle is more sympathetic than is generally recognized, as a part of the latter's "larger effort to secure at least partial acceptance for the place and importance of philosophy in the city" (p. 220). There is much to criticize here, including Tessitore's focus on the Nicomachean Ethics and Politics, which ignores important evidence in the Eudemian Ethics and (possibly pseudo-Aristotelian) Magna Moralia, and no attempt to construct the overall intellectualist moral view that Aristotle ascribes to Socrates and of which he is highly critical. In her contribution, Judith Swanson thoughtfully examines the evidence concerning Aristotle's view of women in biological as well as political works, but then she unaccountably downplays the clear view of women's intellectual inferiority put forth in Politics: Aristotle's "dogmatism means to conceal an elusive teaching about the changeability of nature from those in his audience whose political ambitions might lead them to misconstrue and abuse that teaching" (p.

Despite the editors' claims, little in the volume directly addresses "the possibility of grounding moral and political action in some version of Aristotelian rationalism" (to quote the cover copy). Throughout, there is little attempt to apply Aristotle's thought to contemporary problems. Although the contributions are uneven, considered as a whole, the volume has a definite significance. Traditional scholars will doubtless argue against many particular claims, but they will benefit substantially from doing so. Against the weight of settled interpretations, the collection's accumulation of arguments and evidence conveys the richness and elusiveness of Aristotle's moral and political thought.

Community and Tradition: Conservative Perspectives on the American Experience. Edited by George W. Carey and Bruce Frohnen. Lanham, MD: Rowman & Littlefield, 1998. 206p. \$53.00 cloth, \$22.95 paper.

Community and Political Thought Today. Edited by Peter Augustine Lawler and Dale McConkey. Westport, CT: Praeger, 1998. 244p. \$59.95.

Steven Kautz, Emory University

The horizon of these volumes is familiar: "Today, the particular concern of most political thinkers is the erosion of social and political life, the decline of community. Community is threatened by individuals who are excessively self-conscious, who relate to others too exclusively in terms of egoistic calculation. The source of that preoccupation with calculating selfishness is early liberal political thought" (Community and Political Thought Today, p. xi). The authors of the essays collected in these volumes take as their point of departure the widespread lament among political theorists that the progress of the liberal enlightenment has engendered pervasive and intractable modes of political, social, and private discontent.

The "communitarian" indictment of liberal rationalism and liberal individualism is, of course, almost as old as liberalism itself. From the beginning, illiberal political philosophers have worried about the natural consequences of liberty: inequality and vice. But there is something odd about the most recent revival of the idea of community: its progressive or moderate—even, one might say, liberal—character. Radical assaults on liberal politics have on the whole been supplanted, lately, by efforts to tame the excesses of liberalism without rejecting it wholesale. We are all somehow liberals; we are all somehow communitarians. Many agree: Let us by all means have a more robust community (equality, virtue, tradition); but let us not abandon our rights (among the other securities afforded by liberal polities). The prevailing moderation is a far piece from the harsher critiques of liberalism once common on both Left and Right. Today's communitarianism lacks the moral rigor, the love of justice understood as equality, of the old Left; and it also lacks the moral rigor, the love of virtue understood to require unremitting self-sacrifice, of older republicanism. Praise of community today is most often praise of community that has made its peace with liberalism, including its rationalism and its individualism (see, e.g., Community and Tradition, p. 31).

On the other side of the divide, liberals have been moving toward the center, too. Liberal theorists are learning again to speak the language of virtue, of civil society, of equality, and of community. Many liberals have more or less abandoned the austere individualism, the praise of solitude and acquisitiveness, that was once thought to constitute the core of liberal moral psychology—the idea of the rugged individualist, who would take care of himself because he knew that no one else would much care to do the job. Through one sort of lens, in other words, political theory in the last decade is marked by a convergence of liberals and their critics toward a sort of kinder and gentler liberalism.

What distinguishes these admirable volumes is impatience with this sort of moderate communitarianism. As Wilfred M. McClay puts the point in his essay in Community and Political Thought Today: "The communitarianism we have been getting so far suffers from a fatal defect: it is much too closely bound to the very liberalism it would correct" (p. 101). The editors of Community and Tradition describe their volume as a search for a "fuller and deeper understanding of the true nature of community" (p. 14). Community and Tradition is the more openly partisan book: It offers a conservative vision

of community to counter the contemporary liberal communitarianism that, the editors say, "destroy[s] the possibility for real communities" (p. 14). Community and Political Thought Today is less partisan or programmatic, but many of the contributors agree that the gravity of the crisis facing contemporary liberal polities requires a more radical appreciation of the illiberal nature of communities than is characteristic of mainstream communitarian theorists. Both volumes are valuable contributions to the ongoing debates about the inadequacy of liberal individualism. Many of the essays will challenge those of us who are liberals or liberal communitarians; we will be obliged to think better about whether truly robust community is not almost inescapably illiberal, and about whether truly liberal community is not almost inescapably thin.

The eight essays in Community and Tradition present a more or less unified argument about the defects of progressive communitarianism, together with a sketch of a conservative vision of community. The authors generally embrace the insight of Robert Nisbet, an argument advanced in The Quest for Community (1953) and elsewhere, that conservative partisans of community must oppose the idea of a "national community" as a fraud (pp. 20-4). (This is the principal theme of Kenneth L. Grasso's introductory essay.) True community is intimate community: friendship, family, church. neighborhood, and perhaps voluntary associations of a certain kind. Yet, because such communities are notoriously conservative, many contemporary liberal partisans of the idea of community have been skeptical of proposals to invigorate local communities, fearing their natural exclusivity and intolerance. But this is an error: The idea of a national community is either frivolous or dangerous, either the language of the "soft tyranny" of the "nanny state" (pp. 12, 31-6) or merely "mood music" for an essentially bureaucratic liberal state (Community and Political Thought Today, p. 101). The national political community simply cannot satisfy our need for community—too impersonal, too few of the "essential bonds of shared thought, feeling, and experience of which true community is made" (Community and Tradition, p. 1). It can, however, "misdirect modern man's search for community" and otherwise undermine the intimate communities that are properly the object of the human longing for community (p. 23; and see pp. 41-53, 78-83). And so the contributors to the Carey and Frohnen volume call for a renewal of conservative efforts to cultivate "real communities," which "have invariably been illiberal" (p. 39) and which are founded on the functional autonomy of social institutions, decentralization of political power, hierarchy, and tradition (p. 26).

Community and Tradition also includes several useful historical essays on the relation between liberalism and communalism (republicanism and Protestantism) in early American political history. The essay by McClay in particular, "Mr. Emerson's Tombstone," is a small gem: beautifully written, and a masterly exposition of the transformation of the older Protestant idea of "constrained individuality," with its strong moral and communitarian dimensions, into the "boundless" Emersonian idea of the "autonomous self." which gives rise to a radically individualist "moral chaos," the "worship of the sovereign self and its sovereign appetites" (pp. 87-9, 96-7). This essay is a model of scholarly rigor and passionate advocacy. Finally, the volume contains a number of essays on the modern liberal communitarians Robert Bellah, Charles Taylor, and William Galston; Peter Augustine Lawler's thoughtful essay on Galston, especially, will be of interest to theorists of contemporary liberalism.

Community and Political Thought Today is a more diffuse volume, less partisan and programmatic. It lacks the unity of

viewpoint of Community and Tradition, and the contributors represent a wide range of disciplines, including sociology, political science, history, and political philosophy, as well as a remarkably wide range of philosophical orientations. This diversity has the usual advantages and disadvantages. But perhaps it would be fair to say that the fourteen contributors are united by a shared sense that our principal political problem today is the problem of community. Many of them share, as the editors say, "a moral revulsion against aggressive selfishness" as well as a concern that "the liberated individual may be in constant pursuit of happiness but is too rarely actually happy" (p. xi). "The concern of the authors in this book, in one way or another, is the perpetuation of the 'moral ecology' on which human liberty depends to flourish. They know that the chief threat to liberty today is not smothering community but rootless apathy" (p. xiv). And yet, many of the authors are also doubtful that mainstream communitarian thought can supply effective remedies for the "aggressive individualism" of modern liberal polities.

Thus, for example, several contributors to the Lawler and McConkey volume offer critical analyses of Robert Bellah's work and especially Habits of the Heart. Brad Lowell Stone's essay, "Universal Benevolence, Adjective Justice, and the Rousseauean Way," presents a thoughtful analysis of Bellah's "statist communitarianism" and especially his putative failure to respect "the familiar or communal realm of particularistic benevolence and the public realm of universalistic justice" (p. 96). Several essays discuss the communitarianism of Richard Rorty, of Tocqueville and Arendt, of Michael Sandel, and of the "modern Montesquieu," Raymond Aron (p. 233), among others. The essay by Daniel J. Mahoney, "The Experience of Totalitarianism and the Recovery of Nature: Reflections on Philosophy and Community in the Thought of Solzhenitsyn, Havel, and Strauss," has many virtues; above all, Mahoney offers a remarkable appreciation of the career and work of Solzhenitsyn, one that is not only fair-minded and respectful of his "liberal conservat[ism]" but also wary of the "nascent utopianism" of that dimension of Solzhenitsyn's thought which imprudently seeks to overcome too far the liberal 'separation of statecraft and soulcraft" (p. 219).

Both volumes make valuable contributions to the sometimes stale contemporary literature on liberalism and community.

Machiavelle's Romans: Liberty and Greatness in *The Discourses on Livy*. By J. Patrick Coby. Lanham, MD: Lexington Books, 1999. 267p. \$65.00 cloth, \$23.95 paper.

Anthony J. Parel, University of Calgary

The laudable aim of Coby's study is to rescue the *Discourses* from undeserved relative neglect in scholarly circles. The first part of the study (chaps. 2–6) gives a useful account of the *Discourses*, focusing on the Roman republic's internal structure, external policy, and "captains." The second part (chaps. 7–9) gives Coby's own interpretation of the significance of Machiavelli's achievements in the *Discourses*.

A basic issue that engages Coby's attention is the paradox of the two Machiavellis: the one who holds up ancient Rome as model for imitation and the one who wants to benefit future generations by opening up a new path in political philosophy. Most interpreters have focused on Machiavelli's novità rather than on his Romanità. Coby wants to introduce a balance between the two. His conclusion is that the old predominates, that Machiavelli is "more Roman than modern, and that impressions of newness derive from the fact that liberty and greatness, Machiavelli's twin objectives, occasion-

ally appear in the modern guise, as enlightened and unenlightened acquisitiveness respectively" (p. 11). Certainly, there is novelty in his ethical thought as well, but it is "less than is generally assumed" (ibid.).

Coby's argument revolves around three concepts: acquisitiveness, liberty, and greatness. The universal disposition to acquire and conquer is natural to individuals, social groups, and states, whether princely or republican. In the case of the Roman republic, acquisitiveness was manifested in the ways the republic's two component elements, the patricians and plebeians, related to each other and the body politic. Both were acquisitive, which they manifested in different ways.

The liberty of the Roman republic was the outcome of a state of affairs in which the patricians and plebeians were able to satisfy their respective humors without harming the health of the body politic. Liberty lasted as long as the humors behaved in a healthy way; it disappeared when they behaved in an unhealthy way, namely, when one humor sought its interests at the expense of the other and of the body politic as a whole.

Republican greatness was the outcome of a state of affairs in which the Romans were able to use their liberty and power to extend their domination by means of wars of conquest. The republic became great by extinguishing the liberty of others in peninsular Italy and the Mediterranean littoral. Republican greatness was no respector of other peoples' liberty

Seen in this light, Machiavelli's relationship to modernity appears highly problematic. According to Coby, Machiavelli's attitude toward acquisitiveness was ambiguous at best, an ambiguity which some recent interpreters are very eager to exploit. In Coby's wise judgment, however, Machiavelli's "intent is not the modern project of relieving man's estate but the ancients' ambition of achieving world empire" (p. 278). He is "an ancient, not a modern," insofar as he tried to ennoble acquisitiveness by lifting the sights of humans "from security and wealth to liberty and greatness" (p. 281). Coby's conclusion is that Machiavelli is "a Platonic timocrat lacking the philosopher's vision of the Good" (p. 284).

Under Coby's able guidance the reader gets a grand tour of contemporary Machiavelli scholarship and interpretations. The discussion of liberty and greatness (pp. 254–68) is especially stimulating. Coby is honest and courageous with respect to the interpretations he disputes. He puts paid to the civic humanist as well as to the esoteric reading of the Discourses. Even interpretations based on such notions as "the perpetual republic" and "impartial regime" come under heavy fire. All in all, the book makes the Discourses less mysterious, more intelligible, and more exciting than it is thought to be.

Given the many virtues of this book, it is all the more necessary to point out, however reluctantly, a few of its weaknesses, if only to help the reader make the best use of the book. The chief weakness arises from a misunderstanding of Machiavelli theory of humors (umon) and the related notions of "times" (i temps) and "the heavens" (i cieli). The theory of humors is one of Machiavelli's original contributions to political theory. In the Western canon, no one before or after him used this theory with such skill and explanatory finesse. He used it for a variety of purposes: to classify regimes (principato, libertà, licenzia), to assess their capacity for liberty and greatness, to explain why they rise and fall, and to identify the personality types of individuals, princes, and rulers, the understanding of which was so crucial for their fight against fortune. The theory had its roots in the Renaissance science of medicine, natural philosophy, and astrophys-

Unfortunately, Coby treats Rome's acquisitiveness, liberty, and greatness not in the light of Machiavelli's theory of humors but in the light of a modern theory of class and class conflict. Throughout the book, humors are presented in class terms (e.g., pp. 12, 13, 54, 56, 196, 197, 201, 243, 269). This is surprising in a scholar who is so admirably scrupulous in rendering Machiavelli's modi e ordini as modes and orders. The nadir is reached when the republic is assimilated to "a company divided into management and labor"; humoral conflicts to bad labor relations ("it is good if the workers are unsatisfied, quarrelsome, and suspicious; it is good if they hurl insults at their bosses, have work slowdowns, and go on strike"); the tribunate to labor unions; law to the means of institutionalizing labor unrest; liberty to the safeguards against exploitation; and power to the profits of the company (p. 28). How is this reading of the Discourses compatible with the judgment that Machiavelli had no intention of initiating the modern mode of acquisition? Space limitations prevent me from pointing out the equally unsatisfactory uses made of the notions of "times" and "the heavens."

Because Machiavelli's theory of humors is misunderstood, the book's final conclusion (that Machiavelli is a Platonic timocrat) is set within the framework of Plato's theory of thumos. Briefly, the class analysis of humors and the Platonic enframing of Machiavelli's Romanità diminish the value of an otherwise impressive book.

Eric Voegelin and the Foundations of Modern Political Science. By Barry Cooper. Columbia: University of Missouri Press, 1999. 478p. \$44.95.

The Politics of Truth and Other Untimely Essays: The Crisis of Civic Consciousness. By Ellis Sandoz. Columbia: University of Missouri Press, 1999. 250p. \$39.95.

James M. Rhodes, Marquette University

These two books are by students of the scholarship of Eric Voegelin. The first aspires to clarify the premises of his philosophy. The second aims to apply his insights to the analysis of contemporary political problems.

Cooper's book is an intellectual biography. It starts with Voegelin's attacks on the Nazi race idea in 1933 and leads up to his seminal theoretical works, *The New Science of Politics* (1952) and *Anamnesis* (1966). It undertakes a tremendously difficult task. Voegelin was a scholar whose insights encompassed millennia, whole civilizations, and all the major political, religious, philosophic, scientific, literary, and ideological currents within them. His arguments were built on an erudition so superior to that of his readers that only a few could evaluate his theses independently. Yet, they also were based on assumptions that seemed to be neither self-evidently true nor diligently defended.

Those who studied the enormous body of Voegelin's work from the *New Science* onward usually believed they could understand what he said, but no one ever published a full account of why he had said it. Cooper attempts to supply what has been missing. He examined Voegelin's vast correspondence collected at the Hoover Institution, his mountainous abandoned manuscript on the history of political ideas (1940–52), and numerous authors who influenced Voegelin. Cooper also made a heroic effort to survey the great mass of historical and literary materials that Voegelin mastered (e.g., everything in Toynbee; Mongol legal documents from the eleventh to fourteenth centuries). He traces the origins and evolution of Voegelin's postulates from the outset of his career to the works that brought him public acclaim. Cooper's book rewards careful consideration because it succeeds

in eliminating much of the bewilderment occasioned by the postulates of what really was Voegelin's middle period.

Voegelin often stated that his work had the same motivation as Plato's: The disorder of his time stirred up resistance in his soul. German National Socialism, the twentieth century's sorry record of ideological warfare, and the inadequate reactions of Western democracies and intellectuals to totalitarian movements drew him into a search for the grounds of right order. (In this context, Cooper tells the interesting story of Voegelin's narrow escape from the Nazis in Vienna.) Among those whom Voegelin blamed for the West's ineffective opposition to the totalitarians were the positivists, who denied the possibility of a science of the good. Cooper discusses Voegelin's debates with positivists. Arnold Brecht, particularly, challenged Voegelin to demonstrate the "validity of value judgments." Although Voegelin supposed that there could be a science of order, he always was unresponsive to these demands.

It never was generally clear why Voegelin acknowledged no duty to reply. Relying on little-known letters, Cooper shows that he had two reasons. He judged that Brecht was dogmatically closed to rational discourse, so an answer would have been useless. He also argued that Brecht's position was obsolete in view of the present state of science. Late developments in philosophical anthropology and the historicization of the problems of politics had superceded the values issue. Philosophical anthropology had discovered that the contemplative life of the Greek philosophers was the precondition of a theoretical view of man and that the origin of the bios theoretikos itself was a historical problem. That is, the theoretical life depended on the conditions conducive to its existence. Therefore, Brecht could be refuted only when younger scholars turned away from his position in practice and toward philosophic contemplation (pp. 85-7).

Voegelin's assertion that the origin of the bios theoretikos was historically contingent was another premise that he apparently failed to justify. This assumption appeared in another form in the first sentence of the New Science: "The existence of man in political society is historical existence; and a theory of politics, if it penetrates to principles, must at the same time be a theory of history" (p. 1). Although Voegelin's massive historical studies lent some credence to his principle, no one genuinely understood it or knew from whence it came. Cooper proves that Voegelin's studies of Bodin and Vico convinced him that there is an "unfolding of a pattern of meaning in time" (p. 338) (and, later, that "eternal being realizes itself in time," Anamness, 1978 ed., p. 116). Vico especially taught him that "a transindividual Providence . . . directs the generations of human beings along a line of meaning and that it also is present in the soul of the philosopher in such a way that it becomes intelligible through human contemplation" (p. 375). In this regard, Cooper takes pains to refute the charges of Leo Strauss that Voegelin was a historicist in Strauss's sense of the word. In what certainly will be a controversial accusation, Cooper, who normally is extremely sympathetic to Strauss, suggests that Strauss's indictment of Voegelin resorted to sophistical reasoning (p. 128)

In Anamnesis, Voegelin began to emphasize the philosophy of consciousness, arguing that a divine process of reality manifests itself in human consciousness. Again, readers were left to wonder why he thought so. Cooper shows that Voegelin's premises originated in Schelling's aphorisms on reason, which essentially maintained that "all is only of God, or of the All" (p. 389).

Cooper's meticulously researched, well-argued, and well-written book contains much more that cannot be mentioned

here. It usefully could be extended into a meditation on the adequacy of the foundations of Voegelin's science, a philosophic exercise that Cooper had to leave outside his scope in order to publish a volume of manageable size.

Ellis Sandoz's book is an anthology of occasional papers, some of which were published in journals such as *Modern Age*, others of which were presented at conferences in the Czech Republic on the requirements for establishing democracy there after 1988, and some of which appear here for the first time. All the essays are intended as philosophical lessons in civics. All are inspired by a vision of a university and a profession of political science "that would secure the coherence of the American community and instill the principles of free government in rising generations" (p. 122). All are beautifully written.

Although it is difficult to summarize the contents of a wide-ranging collection under a few headings, one could say that the Sandoz essays fall into six topical categories: the blessings of liberty; the grounding of free democratic government in eternal truth; the history of legal, philosophic, and religious discoveries and acknowledgments of truth; British and American law and civil religion as an embodiment of truth; the practical exigencies of establishing free government and transferring relevant aspects of the American model to Eastern Europe; and the contributions of Eric Voegelin to the science of the truths under consideration. If the essays have a common theme, it is that the line of recognition of eternal truth can be traced from the Bible and classical Greek philosophy to the Christian West; from there to the England of the Magna Carta, the common law jurists, Locke, and Sidney, and from there to the American colonists and founding fathers, not excluding Madison and Jefferson. Furthermore, Sandoz argues that the fall of Soviet-bloc communism has not eliminated threats to free government based on truth, because this evil has been replaced by a rampant, nihilistic deconstructionism that originated in Nietzsche.

Sandoz calls his essays "untimely" because he knows that most contemporary scholars reject his vision of the university and the profession of political science. Yet, in the spirit of Washington and in keeping with Jefferson's reasons for founding the University of Virginia, one should welcome his book as a call to the profession to renew the search for a well-grounded American civics. This is not to say that everyone should or will agree with everything that Sandoz says. Countless American political polemics are full of earnestly quoted proof texts purporting to show that our polity was created by Founders who abhorred the very idea of linking public order to eternal truth. Where there is so much smoke there probably is some fire. I myself am not quite so sanguine as Sandoz about the commitments of Locke and Jefferson to Christian principles of order. Nevertheless, it would be useful for scholars to inquire into means of resolving, or at least living harmoniously with, the American tension between eternal truth, on the one hand, and secular enlightenment, on the other.

Ethics of Consumption: The Good Life, Justice, and Global Stewardship. Edited by David A. Crocker and Toby Linden. Lanham, MD: Rowman & Littlefield, 1998. 585p. \$84.50 cloth, \$27.95 paper.

Leslie Paul Thiele, University of Florida

In this century alone, the world's population has quadrupled. Last October, the milestone of six billion human inhabitants

was reached. Mid-range estimates of future growth put the world population at nine billion by 2050. This growth constitutes a victory for modern medicane, agriculture, and economic development. Average life expectancy has risen 20 years since 1950. Yet, population growth has gone hand in hand with the increasing consumption of natural resources. The "carrying capacity" of the earth, some suggest, has already been surpassed. But the growth of human numbers is not the only cause of natural resource depletion and degradation. Overconsumption by the rich is a significant environmental problem. The wealthiest 25% of the world's population currently consumes 85% of the world's resources and produces 90% of its wastes. Indeed, the average U.S. resident consumes 40 or 50 times the resources of a person in a developing country and produces twice as much trash as the average European. Ethics of Consumption helps us understand and grapple with these national and global trends.

This book is the first of its kind, a compendium of contributions that address from both normative and empirical perspectives the causes and consequences of (over)consumption in an ecological age. The 27 chapters illuminate the life and times of *Homo consumens*. The authors explore the nature of consumption; its means of assessment and measurement; the necessity, costs, and benefits of its reduction and/or more equitable distribution; and its relation to a number of kindred topics, such as agricultural yields, religious commitments, economic development, psychological dispositions, and cultural values.

As in any edited volume, not all contributions are of equal merit. The editors might well have reduced by one-fourth the number of chapters. Even some very well-written and thought-provoking submissions (e.g., by Amartya Sen and Martha Nussbaum) might have been dropped owing to their indirect confrontation with the topic at hand. In turn, some issues were ignored that should not have been. A historical account of the growing scholarly, governmental, and popular concern with consumption would have been helpful. Notwith-standing these criticisms, the volume develops many important themes and is worth mining for illuminating facts and perspectives. I will limit my commentary to a small sample.

Following an introduction by the editors, Herman Daly leads off the volume with the argument that economic growth as it is commonly practiced is impossible to sustain in a finite ecosystem such as the earth. Even if it were possible, endless economic growth may not be worth the price. In "rich" nations, Daly argues, increasing production and consumption yield diminishing returns. Citizens of developed countries suffer ill health much more as a result of overconsumption and the stress of heightened production than of traditional forms of underconsumption or want. We have, for instance, become "goods-rich" but "time-poor." An index of sustainable economic welfare codeveloped by Daly indicates that welfare in the United States since the 1980s has become negatively correlated with increases in GNP. He concludes that the costs of growth are too high.

Mark Sagoff then criticizes Daly and other "ecological economists" who argue that unlimited growth is impossible in a closed system. They insist that we are running out of clean air, clean water, fertile land, and basic foodstuffs. A long-term view of economic utility demonstrates the need for environmental conservation. Sagoff charges that the utilitarian values of ecological economists do ill service to the environment in general and environmental ethics in particular. He argues that nature ought to be protected for moral and spiritual reasons alone. In turn, Sagoff scoffs at the notion that economic growth will necessarily be limited by the

exhaustion of natural resources. Technology will come to the rescue.

In response, Daly chides Sagoff for the rhetorical ploy of denying utilitarian concerns any merit in order to valorize a more spiritual path. In ecological affairs, Daly maintains, morality and prudence really do teach the same lesson—as long as one takes a sufficiently long-term and globally expansive view and does not underestimate the (social and ecological) costs of technological solutions. Daly might also have noted that Sagoff romanticizes the past when he suggests that "early environmentalists" such as Henry David Thoreau and John Muir saw only the divinity of nature and refused to dirty their hands and minds with utilitarian calculations. Anyone who has read Walden knows that Thoreau's defense of the simple life starts off with a chapter entitled "Economy," in which the benefits of living close to nature are shown to outweigh the costs. Similarly, Muir often engaged in utilitarian arguments with politicians and the public to supplement his better-known sermons.

James Nash's chapter, "On the Subversive Virtue: Frugality," suggests one means of personally unifying morality and prudence. Nash observes that frugality, once widely esteemed as a virtue, is not much in favor these days. It is notably absent, for instance, from William Bennett's bestseller compendium of traditional morality, The Book of Virtues. Frugality is a subversive virtue in a socioeconomic system that thrives on growth. Nash insists that frugality is not austerity. He notes that the Latin root of the word suggests fruitfulness. Nash defines frugality as a concern for being over having and for welfare over wealth.

Jerome Segal, in "Consumer Expenditures and the Growth of Need-Required Income," argues that welfare requires more wealth in contemporary society. U.S. per-capita consumption expenditures in constant dollars over the last three decades reveal a remarkable trend. The 1994 level is twice that of 1960 and three times that of 1929. This increase in spending, Segal holds, satisfies "fundamental needs" that previously went unmet or have been dramatically increased. Dual-income families, for example, have significantly more consumption expenditures (higher clothing needs, a second car, more prepared meals, and so on) than families with one housekeeping spouse.

Another cost of growth is examined in Robert Goodland's chapter, "The Case against Consumption of Grain-Fed Meat." Goodland cites well-known studies that demonstrate how harmful to health a diet heavy in meat can be. He also notes UN World Food Council calculations indicating that the global food supply would reach an adequate level if 15% of the cereals currently fed to livestock were employed in human diets. Goodland insists that people should be free to eat whatever they want. But if what they choose to eat has a large negative effect on the environment, then they should pay the full costs of their choice. He proposes that the environmental costs of meat production, such as topsoil loss, siltation, deforestation, and sewage disposal from feedlots, be figured into the price we pay for meat. He also proposes an end to the large-scale government subsidization of meat production in the United States. (Beef production consumes more than ten times the water of grain production, and this use of water is heavily subsidized.) Were meat to pay its own way, one could expect decreased consumption and improved health.

In a chapter entitled "Natural Resource Consumption: North and South," Allen Hammond furthers this line of argument by exploring full-cost accounting. He explains that resource use and degradation could be significantly reduced if the prices paid for goods and services adequately reflected their environmental costs. This could be achieved by any number of mechanisms, including green taxes targeted at polluting industries and the elimination of subsidies for natural resource depletion. In the United States, for instance, timber harvesting is publicly subsidized. The same might be said of automobile use, once the costs of road maintenance and construction and smog abatement are taken into account. Environmentalists have long argued that cars should be "taken off welfare." Public transportation would become much more economically viable were this accomplished.

David Luban believes that achieving a no-growth economy might require authoritarian rule. Austerity, he suggests, cannot be democratically sustained. Environmentally "safe growth" is proposed as a politically feasible alternative. Advocates for sustainable development have long supported economic growth that is stimulated by environmentally friendly services and technologies and does not increase the consumption of energy, raw materials, and habitat. Economic growth that serves to redistribute resources more equitably may also be environmentally beneficial. Nonetheless, Luban is right to note that the nature of public commitment to sustainability affects its political feasibility. The vast majority of Americans enthusiastically endorse environmental protection. Such attitudes, however, have not much altered patterns of consumption. "We talk green," Luban writes, "but live brown" (p. 127). This contradiction, he notes, is nicely illustrated by a Saturday-morning cartoon character, Captain Planet, who teams up with children from across the globe to fight pollution and save the earth. Captain Planet episodes, ironically, are sandwiched between multiple layers of advertisements coaxing the young audience to consume toys at a rate that would challenge the skills of any superhero.

In "Consuming Because Others Consume," Judith Lichtenberg argues that our early and ongoing love affair with conspicuous consumption has psychological roots. She explains that people consume goods to the extent they do in large part because others around them are engaged in similar levels of consumption. (That might explain why Americans spend three to four times more hours shopping each year than Western Europeans.) The upshot of Lichtenberg's thesis is that collective reductions in consumption will prove much less painful than isolated individual acts. The psychological benefits of consumption, in other words, are relative rather than absolute. Her argument feeds nicely into empirical studies of the relationship between wealth and felicity.

In "The Road Not Taken: Friendship, Consumerism and Happiness," Robert Lane reports on research demonstrating that happiness does not increase with rises in income above the poverty line. Across time, Lane observes, there may indeed be an inverse relationship. He notes that postwar generations in developed countries are at least three times more likely to suffer major depression than their grandparents' generation. In the United States, the likelihood of depression is ten times as high for current generations. To a significant degree, this increase in mental illness is caused by declines in social support and integration. Lane argues that the expansion of the market causes or exacerbates these declines by elevating instrumentalist and materialist values and exacting overtime labor. The market also erodes community directly, Lane proposes, because at high levels of income, money is increasingly spent on goods consumed individually rather than collectively. If Lane's argument is correct, psychological therapy would constitute one of the "fundamental needs" that increase our consumption expenditures in a growth-happy world.

Justice and the Environment: Conceptions of Environmental Sustainability and Dimensions of Social Justice. By Andrew Dobson. Oxford: Oxford University Press, 1999. 280p. \$55.00 cloth, \$29.95 paper.

Capitalism, Democracy, and Ecology: Departing from Marx. By Timothy W. Luke. Champaign: University of Illinois Press, 1999. 254p. \$49.95 cloth, \$19.95 paper.

Environmentalism for a New Millennium: The Challenge of Coevolution. By Leslie Paul Thiele. New York: Oxford University Press, 1999. 302p. \$35.00.

John S. Dryzek, University of Melbourne

On the face of it, these books have much in common. All three authors believe that social justice has to be addressed in contemporary political thinking about the environment, but they engage issues of environmental justice in very different ways. Leslie Thiele wants to accommodate it in an expanded environmental movement. Timothy Luke wants to purge that movement in favor of environmental justice. And Andrew Dobson cautions that connections between justice and environmentalism are often a lot more complex and tenuous than either Thiele or Luke would allow.

Thiele's intent is to identify and promote a "fourth wave" of environmentalism in the United States, whose emergence is dated to the late 1980s. This wave is more truly ecological than its predecessors, emphasizing the "dynamic interdependence" (p. 31) and coevolution of nature and humanity. Environmentalists should recognize their own place in this interdependent system and so celebrate the contribution of different kinds of thinking and action to the coevolutionary enterprise. This enterprise can embrace biocentric and anthropocentric thinking, spirituality and rationalism, local and national action, human welfare environmentalism and wilderness preservation, reformism and radicalism. This is an environmentalism without enemies, one that welcomes almost all comers in the coevolutionary quest, excluding only the antienvironmentalism of the ill-named wise use movement and its allies in the property rights movement. Even these merit congratulations from Thiele for their ability to mobilize rural communities, which environmentalists have failed to do.

Thiele's account is grounded in a (slightly foreshortened) history populated by three earlier waves of environmentalism. The first is a century old, combining Gifford Pinchot's conservation movement and John Muir's preservationism. The second, which began in the later 1960s, emphasized planetary limits to the growth of economies and populations. The third era began in the early 1980s and featured cooptation, not in any pejorative sense but in terms of the incorporation of environmentalism into the political mainstream. One might quibble with details of this history. Thiele accommodates seeming opposites in the first wave (Pinchot and Muir), third wave (the large national organizations and the grassroots antitoxics movement), and fourth wave (the large corporations in the Business Council for Sustainable Development and the preservationist radicals of Earth First!). And it is curious that he dates the beginning of cooptation to the exact moment when the Reagan administration attempted to expel environmentalism from the corridors of power. Still, this periodization makes some sense, especially as a history with practical intent. And the intent is commendable, although one might wonder about the prospects for popular embrace of coevolution in a country in which many people do not even believe in evolution.

Thiele's coevolutionary fourth wave is fed by three currents: sustainable development, with its focus on the long-term future; environmental justice and its expansion of

environmentalism to encompass the poor, ethnic minorities, and indigenous peoples disproportionately exposed to environmental hazards; and biocentrism, with its concern for the nonhuman world. All three currents enlarge our thinking: respectively, in time, across different categories of people, and across different species. Thiele enlarges our thinking about where environmentalism has gone and might go. Presumably, Luke and Dobson would argue that Thiele is too generous. Both of them supply an analytical razor: Luke to cut away kinds of environmentalism that he believes have got it wrong, and Dobson, more dispassionately, to enable us to take a hard look at alleged connections between social justice and environmental concern.

If contemporary environmentalism is conceived as a Rorschach test, then where Thiele sees a hundred flowers, Luke sees an infestation of weeds. Luke wants to cut them away and so render ecological protest fit to counter informational capitalism. He also claims to believe in coevolution between human and nonhuman life (p. 23) but is far more selective than Thiele when it comes to the kind of humanity that qualifies.

Luke develops a post-Marxist class analysis of contemporary society, according to which the world is now dominated by a "new class," a "professional-technical intelligentsia" (p. 50) that knows no boundaries, least of all ecological boundaries. The new class manipulates flows of cash and information alike. By writing this book Luke reveals his own membership in the new class, and by the content of the book he reveals himself a class traitor.

Some new class members claim to be environmentalists, but close examination reveals their environmentalism to be a way of further securing the power of their class; Luke condemns them as "ecodisciplinarians" serving the interests of "green governmentality." Here he takes his bearings from Foucault rather than Marx. About the only environmentalists who escape Luke's condemnation are the grassroots activists of the environmental justice movement, which, in another parallel with Thiele, Luke terms "fourth wave" environmentalism (p. 7). He wants to recruit these activists for an ecopopulist crusade against the new class. This is environmentalism as class war; departing from Marx, Luke believes that it is populist movements rather than the working class who now hold the key to history. What these movements can hope to accomplish in light of the massive forces arrayed against them remains unclear, especially given that, for any environmentalist opposition, the "real danger lies not in being ignored but rather in being accepted too literally and too soon" (p. 89). Closer attention to the real-world environmental justice movement would reveal that it, too, has often compromised.

In one of the best chapters, Luke deals with the unlikely figure of the Unabomber, treated as a "case study... in what new populist oppositional movements ought not to do" (p. 171), such as murder individual members of the new class. But perhaps the very fact that Luke needs to reach this far suggests there are few other straws for him to grasp in the real world of ecopopulist activism. Still, his book is a powerful critique, fully in the tradition of Marx as the uncompromising, ruthless, and comprehensive critic of capitalism, and it deserves to be widely read, not least by those whom Luke is likely to infuriate.

Thiele believes in an easy accommodation of sustainable development and environmental justice. Dobson believes that this kind of claim, central to the now-dominant discourse of sustainable development, merits close analytical attention. Taking its bearings from the landmark statement of the World Commission on Environment and Development (the

Brundtland Report) in 1987, this discourse assumes that social justice, especially in the form of global alleviation of poverty, is instrumental to sustainability. Dobson recognizes that social justice and sustainability are likely to remain important political goals for the foreseeable future and approves of both. His intent is to identify both synergies and conflicts across these two goals.

Dobson's task is not made any easier by the sheer proliferation of meanings of both sustainability and justice. This proliferation is tackled head-on in applying an "analytical and typological" approach to conceptual clarification; it rejects both a definitional approach that would stipulate a single essence for a concept and a discursive approach that would dwell on a concept's history. The idea, then, is to digest the relevant literature in pursuit of a small number of types with comprehensive coverage.

Sustainability proves quite tractable in these terms. Dobson identifies three conceptions of sustainability: Type A sustains "critical natural capital" for the sake of human welfare; type B sustains "irreversible nature" for the sake of both humans and nonhuman nature; and type C sustains nature for the sake of nature. It should be noted immediately that by narrowing the field to environmental sustainability, Dobson rules out the many conceptions of sustainable development that see some measure of human welfare (such as aggregate income, or even economic growth) as that which is to be sustained.

Dobson finds justice to be far less amenable to this sort of conceptual clarification. He begins by observing that theories of justice can be arrayed along three dimensions: substantive to impartial, consequential to procedural, and particular to universal. The usual suspects are surveyed: early and late Rawls, Gilligan, Nozick, Barry, Ackerman, Walzer, Miller, and so on. But theories of justice prove resistant to distillation into a small number of categories. Dobson then has no choice but to examine how aspects of theories of justice intersect with the three kinds of sustainability in "interesting" (p. 84) ways. The core chapters of the book are therefore organized by the three sustainability types, and aspects of the theories of justice are brought to bear as seems appropriate.

The exposition gets quite complicated, but some clear themes emerge. First, when it comes to nonhuman nature (notably in sustainability C, although also to an extent in B), the language of justice fails altogether. Those such as Luke who believe that environmentalism should be organized around a focus on, and movement for, environmental justice are missing this key point. Environmental justice is in the end about the distribution of environmental goods and risks across humans, while other kinds of environmentalism value goods that cannot be reached by the justice discourse.

Dobson has still worse news for advocates of sustainable development like Thiele, who believe in an easy accommodation between sustainability and justice. Brundtland and her followers argue that the alleviation of poverty will produce environmental benefits, because the poor will be released from the need to destroy critical natural capital to meet present needs. But it is at least as plausible that the rising consumption of the no-longer-poor will increase net levels of environmental stress. The issue is in the end an empirical one, and as Dobson observes correctly, the requisite empirical work has not been done.

But Dobson's news is not all bad for environmental justice. When it comes to sustaining both critical natural capital and irreversible nature (at least for the sake of humans), the language of justice can indeed be brought to bear, especially conceptions of justice that are substantive rather than impartial, consequential rather than procedural, and universal

rather than particular. Thus, libertarians, neutral liberals, feminist advocates of an ethic of care for particular others, and communitarians all fare badly. Dobson also believes that to be environmentally relevant at all, the boundaries of justice must be extended to encompass intergenerational justice, and it is on such intertemporal issues that the language of justice proves essential.

Dobson has done an impressive service to green political theory in working through the intricacies of relationships between sustainability and justice. His main points are important, especially where he explodes generalizations that have been accepted all too easily in the sustainability discourse, and his arguments are generally persuasive. Yet, he misses one crucial connection between environmental justice and all three types of sustainability. In mobilizing the poor against environmental risks, the environmental justice movement makes it harder for the industrial political economy to produce such risks to begin with. The rich have always made sure that toxic wastes are not dumped in their backyard. If the poor can also refuse, there is no place for these wastes to go. Thus, success on the part of the movement would also promote a reconfigured economy that would impose less stress on the world's ecosystems by not producing such wastes in the first place. This change could only be good for Dobson's A and B categories of sustainability, possibly even for his C category.

Luke (pp. 59-60) and Dobson (p. 11) both argue that political theory and environmental thinking rarely connect. But their observations are falsified by the very existence of these three fine and thought-provoking works—and the burgeoning literature on ecopolitical thinking to which they are welcome additions.

John Dewey: America's Philosopher of Democracy. By David Fott. Lanham, MD: Rowman & Littlefield, 1998. 166p. \$58.00 cloth, \$19.95 paper.

The Political Philosophy of John Dewey. By Terry Hoy. Westport, CT: Praeger, 1998. 141p. \$49.95.

Timothy Kaufman-Osborn, Whitman College

The three most important philosophers of the twentieth century, wrote Richard Rorty in Philosophy and the Mirror of Nature (1979), are Ludwig Wittgenstein, Martin Heidegger, and John Dewey. To many the appropriateness of conferring this accolade upon Wittgenstein and Heidegger may seem, at the very least, worth a decent argument. But Dewey? His inclusion in this trio appears vaguely embarrassing, if not outright incredible. He was waning in influence as early as the 1930s and was largely forgotten during the four decades preceding Rorty's reclamation effort, it seems not unreasonable to consign America's "philosopher of democracy" to the dustbin of intellectual history. Since 1979, however, animated in large part by a desire to rescue pragmatism from Rorty's idiosyncratic appropriation, scholars have repeatedly recycled Dewey's writings, in many cases with salutary results. Considered collectively, the contributions of Charles Anderson, Richard Bernstein, John Patrick Diggins, Steven Rockefeller, Alan Ryan, David Steiner, Cornell West, and Richard Westbrook have rendered Rorty's tribute less implausible. even if in the last analysis we remain unpersuaded that Dewey merits the status of resident alien amid the pantheon of this century's European luminaries.

The publication of these two new books on Dewey's political thought, each of which takes Rorty as its foil, indicates that this industry is still chugging along, if only in the sense that it continues to churn out ever more product.

Yet, as is often the case when markets become saturated, their appearance also may signal a decline in this enterprise's overall profit margin. Both works affirm Dewey's stature in the twentieth century, but neither gives us much reason to believe that he will remain prominent in the next.

Terry Hoy offers a concise and lucid exposition of Dewey's call for a reconstructed liberalism; as such, the book has much to recommend it, especially for those who have wondered how, for pedagogical purposes, to reduce Dewey's prolific political musings to digestible dimensions. That call, Hoy explains, was prompted by a recognition of "the contradictions and ambiguities of Enlightenment modernity" (p. 8), most particularly its conjunction of stunning technological accomplishment and remarkable economic productivity, on the one hand, and its relentless generation of misery, whether in the form of impoverishment or the standardization of everyday life, on the other. To account for this paradox, Dewey cited the subordination of classical liberalism's emancipatory import to the ideological imperatives of laissez-faire capitalism. Dewey's response, Hoy argues, was that of a radical Progressive, one who found the New Deal's reformist ambitions too modest and piecemeal but who was unwilling (leaving aside his awkward embrace of the Soviet Union in the 1920s) to endorse the cause of state socialism.

Although noteworthy for its careful presentation, Hoy's exposition will prove more or less familiar to those conversant with the main currents of Dewey scholarship. Its distinctive contribution, therefore, must be located in its contention that Dewey's political theory shows how we might begin to fashion a truly democratic socialism, one that will free liberalism from its capitalist fetters without falling prey to the evils of centralized planning. Because Hoy's imagined interlocutors are primarily philosophical rather than political in orientation, however, and because his chief concern is to show how Dewey is unlike Alasdair MacIntyre but much like John Rawls, the author never quite makes good on this promise.

Moreover, to one perhaps too well versed in the work of Foucault and his ilk, as am I, the cash value of Hoy's general calls for the revitalization of face-to-face communities, for the creation of truly progressive schools, for the extension of scientific inquiry into all realms of social life, and for state support of small-scale private enterprises cannot help but appear suspect. Do not such appeals ring hollow, perhaps even naive, when confronted by the apparently inexorable spread of surveillance technologies, the resurgence of religious fundamentalisms of various stripes, the merger mania that now defines global capitalism, the displacement of embodied communities by their digitalized counterparts, the proliferation of genocidal extermination campaigns, and so on? Is it possible that the paradox Dewey found resident within the Enlightenment has now been resolved, but in a way that mocks all appeals to the power of "organized social intelligence"?

Consistent with his claim that Dewey indicates how we might split the difference between laissez-faire liberalism and state socialism, Hoy claims that pragmatism also shows us how a renascent liberalism might secure the sort of grounding it requires in order to defend itself against its illiberal opponents, but without falling prey to either metaphysical foundationalism or postmodern relativism. Informing this contention is a rejection of Rorty's insistence that liberalism can do perfectly well without any footing more stable than that furnished by the contingent social practices constitutive of American democracy. To demarcate this ground, Hoy explicates and defends what he calls Dewey's "naturalistic humanism" (p. 9), a doctrine whose coherence ultimately

turns on the success of his effort to revive a nonteleological concept of human potentiality. Yet, that success is precisely what David Fott, in John Dewey: America's Philosopher of Democracy, calls into question. Hoy notes in his opening chapter that after World War II Dewey came under fire from Left and Right alike. The latter in particular contended that, because pragmatism could not conclusively escape the charge of "moral relativism and nihilism," it signaled "a spiritual decline of the West" (p. 4). Fott's book is the latest statement of that critique.

Although Fott explores many other concerns (e.g., the place of aesthetics in public life, the relationship between religion and politics, the liberal/communitarian debate), what really drives his inquiry is a single overarching question: "What sort of philosophical justification may be found for liberal democracy as a form of government" (p. 2)? As the godless harbinger of all that is wrong with what Fott indiscriminately labels "postmodernism," "deconstructionism," and "historicism," it is Rorty who must be defeated at all costs. It appears that is easily done. Rorty's entire philosophical edifice collapses, Fott insists, when one recognizes the simple logical fallacy at its core: If Rorty represents his rejection of all transcendent truth as itself a timeless truth, then his project is ultimately self-refuting. Having disposed of Rorty with this single stroke, Fott then turns to the question of whether Dewey should be similarly dispatched.

Fott's response is not so easily summarized, either because it is not altogether clear or because it is exceedingly subtle. Which of these assessments is more plausible turns, I suspect, on what one makes of claims such as the following: "On the question of foundationalism Dewey, as I shall show, seems to belong both to the philosophical tradition and to the sort of opposition to the tradition that is found in Rorty" (p. 63). On the one hand. Fott seeks "to rebut the widely noted interpretation of Dewey as opposed to all philosophical bases for politics" (p. 23). To do so, and much like Hoy, Fott explores Dewey's affirmation of the continuity of organism and environment, as well as the notion of growth that emerges from this affirmation, in order to show how metaphysical presuppositions undergird Dewey's conception of community and, by extension, his representation of democracy. On the other hand, Fott argues that Dewey's relativism, most troublingly apparent in his construction of science as a sort of creative art, invites "the view that he is an intellectual ancestor of postmodern political thought" (p. 116).

The political consequences that attend Dewey's failure to defend a more robust conception of reason include an inability to specify fixed limits to the scope of governmental action, which generates an inability to respond effectively to Tocqueville's concerns about majority tyranny, which in turn generates an inability to guarantee the sort of liberty that is necessary to the cultivation of independent thought and individual character. Just why Fott thinks these consequences of postmodern skepticism should be of concern is not evident, at least to me, since he also insists that most Americans "believe in God" and "affirm something like the inalienable human rights of the Declaration of Independence" (p. 117). If, indeed, the relativism so vigorously rejected by this book is unlikely "to gain widespread acceptance" (p. 117), and if, instead, the real danger to American politics is the outbreak of dogmatic forms of "political enthusiasm" (p. 118), then why does Fott close his book with a call to counter the hostility to revealed religion that has been encouraged by those secular cynics who now control America's public educational system?

However misguided his version of pragmatism, one thing Richard Rorty understands quite well is Dewey's claim that certain key philosophical dilemmas are not so much to be resolved as abandoned. If nothing else, these two books indicate our continuing failure to stop fretting about the twin perils of relativism and foundationalism. Fott condemns Dewey and Rorty alike for their inability to show how liberalism, absent some solid ground, can escape the snares of subjectivism, whereas Hoy lauds Dewey for his success in showing how liberalism can defend itself against rival traditions by rooting its claims in a rationally defensible conception of potentiality. It is my suspicion, contra both, that the specifically political promise of pragmatism will remain unfulfilled so long as its interpreters feel compelled to answer questions Dewey urged us simply to forget.

The Ticking Tenure Clock: An Academic Novel. By Blaire French. Albany: State University of New York Press, 1998. 256p. \$24.50.

Kathy E. Ferguson, University of Hawaii

Put together all the worst stories you have ever heard about academia, and you have the Department of Political Science at fictitious Patrick Henry University in Virginia, the setting for Blaire French's entertaining novel about a young professor's struggle toward self-definition. This department could be the inspiration for the infamous observation that academic politics are so vicious because the stakes are so low. The men with power are arrogant and dangerous. They twist the renewal criteria to ambush hapless untenured faculty and manipulate the exam process to sabotage outstanding graduate students and protect tender faculty egos. The men and women without power are generally anxious and weak, conforming with bitterness but little protest to the arbitrary rules governing their work. Departmental conversations consist of junior faculty (referred to as minnows by the main character) strategizing for favor vis-à-vis the senior faculty (whales) and jockeying for status among their own ranks, while the senior faculty brag about accomplishments, rest on ancient laurels, protect turf, and bully everyone else. The senior faculty pontificate; the junior faculty equivocate; the graduate students try, unsuccessfully, to stay out of the line of

Deeply invested in succeeding in this altogether nasty environment is Lydia Martin, a young American government professor who has all the markings of upward mobility. She published her dissertation as a successful first book on the environmental movement; she is an adequate teacher, she works all the time; she has no personal life. She is up for tenure. Lydia makes it a practice to "roll over" in any conflict with the big shots, promising herself independence after tenure; she often reassures herself that she is "willing to endure six years of submissiveness in return for a lifetime of freedom" (p. 17). She engages in constant calculations about the flow of power—is she above or below the hapless Victor, whose first book got mediocre reviews and whose second flounders in publishing purgatory? Is she sufficiently impressive to provoke awe from those beneath her and sufficiently unthreatening to be accepted by those above?

The most compelling thread of this novel is the chain of events that enables Lydia's transformation from the ranks of the ethically challenged into a likeable human being. Her "roll over" strategy slowly erodes in the face of massive injustices she witnesses toward those low in the departmental hierarchy, including herself. Lydia's emergence from the amoral world of "success at any price" to a more self-reflective and critical posture is a wonderful coming out fantasy. She develops a conscience; she stands up for the

graduate student underdogs; she admits a friendship with a young, naïve colleague; and she continues a line of research that her conservative senior colleagues find politically objectionable. Simultaneously, she writes the needed second book in record time, wins extensive praise within and beyond academic circles, becomes famous, and achieves tenure. In the end, Lydia has it all—except Charles, the handsome environmentalist who recoiled from her cold calculations of self-interest. Yet, it was Charles's revulsion that led Lydia to her epiphany of self-recognition, his rejection of her and the "roll over" rule that taught her its limits.

Despite its charms, there is not enough irony in this story to make the academic archetypes funny instead of shallow or to push through exaggeration to satire. Lydia's colleagues are uniformly one-dimensional, their ranks unrelieved by anyone who is the least bit interesting. Lydia's own epiphany leads her to question the value of utter conformity and selfinterested career calculations, but there is no larger political frame for these developments, and it is quite unclear where they will lead. Blaire French entertains us in this novel with an academic department we can love to hate, but in the end her character triumphs within a system that she has given us every reason to hold in contempt. There is little in this portrait that would let us understand why Lydia works so hard to join such a poisonous cesspool of a profession. She evidently takes no pleasure in her teaching, and in any event the undergraduates are portrayed as uninteresting and obsessed with grades. She likes getting good reviews but has no political commitments informing her research. The novel's subplot takes Lydia into the unfamiliar world of health food stores, radical environmentalists, and New Age spirituality as she studies a local animal rights group, where the people are more interesting, but the politics of engagement do not rub off on Lydia. While she looks forward to making more money after tenure, she has only disdain for the senior faculty whose ranks she seeks to join.

If Lydia's desires are mysterious, those of the graduate students are even more so: They are inexplicably motivated to work hard to join this profession, even when they are sandbagged during their exams, denied financial aid for perceived disloyalties, and subject to theft of their work by senior faculty. Unlike, for example, Gail Griffin's powerful portrayal of the charged complexities of academic life in Calling (1992), Blaire French sketches a flat organizational and interpersonal landscape, one devoid of the competing energies that could tell a more turbulent story.

The Rule of the Rich?: Adam Smith's Argument against Political Power. By Susan E. Gallagher. University Park: Pennsylvania State University Press, 1998. 141p. \$28.50.

Mark E. Yellin, North Carolina State University

The Rule of the Rich? is a provocative, interesting, and clearly written work that both challenges recent revisionist accounts of Adam Smith's political and economic thought and offers its own relatively radical reinterpretation of Smith's project in the Theory of Moral Sentiments and the Wealth of Nations. Gallagher calls attention to some less appreciated issues in Smith, most notably how he dealt with what can be called the problem of authority or determining who rules. This book is a return to standard works on Adam Smith, such as Joseph Cropsey's Polity and Economy (1957), in the way it emphasizes Smith's response to a rising commercial elite that displaced the aristocracy in eighteenth-century Britain. Gallagher's approach, however, is not Straussian, and her conclusions go well beyond those of previous Smith scholars.

What we get here is not simply an Adam Smith who emphasizes limited government and unencumbered markets, but an Adam Smith who rejects politics as such.

Gallagher's work builds on and is primarily a response to the Cambridge approach to the history of political thought most typically identified with J. G. A. Pocock. This approach emphasizes historical and linguistic contextualization as essential to proper interpretation. Methodologically, Gallagher is clearly sympathetic to this approach, but she is also quite critical of the way in which different Cambridge school scholars, such as John Robertson and Donald Winch, have argued for a very political Adam Smith.

In the "revisionist" Cambridge school interpretation, Smith is seen as responding to the classical republican or civic humanist critique of commercial society offered by opposition politicians such as Bolingbroke to the Walpole regime. Gallagher calls into question this revisionist scholarship, which argues that "Smith was an advocate of agrarian rather than industrial capitalism," engaged in "an effort to defend the British aristocracy against classical republican critics of commercial modernity; that he tried to promote civic virtue ...; and that he dealt with the moral defects of commercial society by placing his arguments within a jurisprudential framework" (p. 70). In place of such claims Gallagher offers an account of Smith in which he rejects any political role for the aristocracy and in which he rejects politics as such. Gallagher argues that for Smith the solution to the moral defects of commercial society could be found in allowing the unintended consequences of economic activity to play themselves out without any political interference, allowing "nature" to take its course. Gallagher is in effect revising the revisionists.

The key theme of the book is the place of a corrupt and incompetent aristocracy within a commercially dominated eighteenth-century British politics. Before turning to her discussion of Smith, Gallagher does a superb job of setting the stage with a thoughtful analysis of three key political thinkers who preceded Smith in considering the problem of aristocratic corruption. Indeed, one strength of this book is the way it is organized; a chapter each is spent on analyzing Mandeville, Bolingbroke, and David Hume and their responses to the crisis of authority. Gallagher initially presents a stark opposition between Mandeville and Bolingbroke. The former is presented as a withering critic of aristocratic pretension and hypocrisy, whereas the latter is portrayed as a vitriolic defender of aristocratic interest, using the republican language of virtue to condemn the moral corruption brought on by commerce. Hume occupies a kind of middle position. He recognizes the incompetence of the aristocracy but sees it as necessary for maintaining political order and stability in the new commercial age. By placing her account of Smith against the backdrop of these three thinkers, Gallagher allows us to see why Smith's rejection of a political role for the aristocracy would amount to a fundamental break with previous political thought.

The great flaw in this work is that the subtle, nuanced, and mostly accurate analysis that Gallagher gives us of Mandeville, Bolingbroke, and Hume does not quite extend to Smith. Gallagher deserves credit for examining the issue of authority in Smith, but her account overemphasizes the importance of certain passages, most notably those in which Smith highlights the perverse effects of government action, and she virtually omits any important discussion of the proper and positive role of government found in Book Five of the Wealth of Nations. In doing so, and in portraying Smith as a radically antipolitical thinker, Gallagher moves from a highly plausible

and convincing set of premises to an ultimately implausible

The author makes some very important and insightful points about Smith's view of the role of the aristocracy, but she does not adequately prove that Smith's views lead to the complete rejection of the aristocracy from politics, much less to a rejection of politics as such. One of her objectives is to distinguish Smith's view of the aristocracy from Hume's, but there is little actual evidence that they differed on this point. They had public disagreements on several important matters, such as how to deal with religious sects and the desirability of standing armies, but there is little difference in their thinking on the overall importance of political authority and the functional need for the aristocracy, whatever its defects.

To reject a political role for the aristocracy would be to reject the theory of the balanced constitution, that is, the commonplace view in eighteenth-century Britain that emphasized the need for three orders—commons, aristocracy, and monarchy—to pursue their respective roles and interests and as such thwart any one order from complete domination and tyranny. Smith clearly accepts this notion in the *Theory of Moral Sentuments* (VI.ii.2.9). Even if the aristocracy was seen as useless and even harmful, as Gallagher suggests, it still had a constitutional purpose to serve. This in itself presents a paradoxical problem that Gallagher does not address: What does one do with an order of society that is failing but is still necessary?

This points to an interpretation of Smith that is prosaic but probably more accurate. With the apparent failure of the aristocracy to continue to command respect and deference, a shift had to be made in the direction of a constitutional regime based more on institutional design than on social orders. The turn in emphasis to institutional structure for a commercial society is where both Cropsey in his work and Donald Winch in Adam Smith's Politics (1978) end up, although by very different routes. This suggests a truncated and limited notion of political life compared to the classical republican notions, but it is not an utter rejection of politics.

Gallagher's work could have been strengthened if it had also engaged two significant contemporary works, J.C.D. Clark's English Society 1688–1832 (1985) and Jerry Muller's Adam Smith in His Time and Ours (1993). It is particularly baffling that Gallagher did not take on Clark's work, which has recently been at the center of debates of eighteenthcentury historiography, since it could have served as an excellent foil for her argument. Clark maintains that there was no problem of the aristocracy in eighteenth-century Britain. In his view, aristocratic dominance and a culture of deference fit hand-in-glove with commercial development. Muller's work would have been useful because he sees Smith as someone with a very well-developed view of institutional design and its role in promoting prosperity, decency, and freedom. Muller even goes beyond Winch's work, seeing Smith as someone with not only a concern for politics but also a coherent and comprehensive political philosophy. If Gallagher had been able to show that Muller's claims about Smith's project were untenable, her interpretation truly would have broken new ground.

Despite the objections raised here, Gallagher's book is an important and insightful study that will be of interest to anyone who works on eighteenth-century British political thought or on the role of authority in commercial society. In addition, because of its readability and concise length, it is accessible to those with little background who would like to know more about Mandeville, Bolingbroke, Hume, and Smith.

In Defense of Natural Law. By Robert P. George. Oxford: Oxford University Press, 1999. 343p. \$65.00.

Stanley C. Brubaker, Colgate University

Robert P. George, McCormick Professor of Jurisprudence at Princeton, brings together a series of important essays linked by their common defense of natural law. The book consists of three parts: a direct defense against natural law's several critics; an indirect defense through engagement with alternative moral and political theories (those of Amy Gutmann, Joel Feinberg, Alasdair MacIntyre, Michael Perry, Richard Posner, Andrew Sullivan, and Dennis Thompson); and an illustrative defense, building on the author's Making Men Moral (1993), which shows natural law to be a formidable and attractive alternative to liberalism on such morally charged issues as gay marriage, pornography, abortion, religious freedom, and international law. On every front, George shows himself to be a champion of the first order. His arguments display analytic rigor, penetrating insight, honesty and graciousness toward his adversaries, moral seriousness, and rare moral courage.

The school of natural law that George defends (he modestly denies a major role in its development, p. 1) has been called the New Natural Law (NNL), although the title misleads if it implies novelty in the law's content. Instead, NNL advocates endeavor to articulate what has always been the natural law and to rescue it from what they believe is a legion of misguided exponents, in particular, those who have portrayed natural law in a manner that renders it vulnerable to the charge of "naturalistic fallacy," inferring a moral "ought" from a natural "is." Such fallacy includes the common interpretation of Aquinas's first principle of practical reason ("good is to be done and pursued, and evil is to be avoided") as a moral imperative ("ought") derived from speculative reason's identification of man's good with his natural end, or telos ("is"). In a seminal reinterpretation, the school's founder, Germain Grizez, argued that Aquinas makes no such derivation, only states a "pre-moral" principle of any coherent practical reasoning ("The First Principle of Practical Reason," Natural Law Forum 10 [1965]: 168-96).

Building on this interpretive insight, Grizez and later John Finnis (Natural Law and Natural Right, 1980), developed an understanding of nonhierarchical, incommensurable, and pre-moral "basic goods" (life, health, knowledge, play, aesthetic experience, friendship, practical reasonableness, and religion), whose goodness and ultimacy are not derived from prior speculative knowledge of nature; they are instead "self-evident" to one carefully reflecting on his reasons for action. Understanding these basic goods then allows for the derivation of NNL's "moral norms." Grizez and Finnis, according to George, thus "deny any rational basis of an identification of 'the natural' with 'the morally good'" (p. 60).

Although this independence from nature rescues NNL from the naturalistic fallacy, it also allows critics to pose troubling questions. In what sense is NNL natural? Can it dispense with the idea of nature as normative without rendering its basic goods and moral norms mere subjective preferences, social conventions, or structures of the mind? If one cannot derive an "ought" from an "is," can Grizez and Finnis derive an "ought" (moral norms) from a "good" (the basic goods)? Such are the concerns of the most penetrating portions of In Defense of Natural Law. In response to the last question, George candidly acknowledges that initial statements by Grizez and Finnis left the derivation of the moral norms "obscure" (p. 50), but he argues the problem has been subsequently resolved by their concept of "integral human"

fulfillment," a moral ideal that is not derived from the basic goods yet is somehow rendered visible in their light (p. 54). From this ideal, they derive the first principle of morality ("will those and only those possibilities whose willing is compatible with integral human fulfillment," p. 51), and hence the rest of the moral norms embraced by NNL.

If the ideal of "integral human fulfillment" permits a more strictly logical derivation of "ought" from "ought," what does it imply about the nature of nature in NNL? Despite misimpressions to the contrary in critiques of NNL by Russell Hittinger, Ralph McInerny, Henry Veatch, and Lloyd Weinreb, George holds that NNL advocates have never "denied that the basic human goods and moral norms have a groundin human nature" (p. 85, emphasis added). NNL simply holds that knowledge of the basic goods and moral norms is not derived from prior speculative knowledge of man's nature. In fact, George argues, as a matter of ontology as opposed to epistemology, human goods and moral norms presuppose the existence of human nature, whose perfection they envision. If human nature were other than it is, basic goods and moral norms would have to be other than they are (pp. 86-7).

If, however, moral norms are indeed grounded in nature—even though this nature may only be known as a presupposition of practical reasoning rather than more directly through speculative reasoning—then one is left wondering why NNL advocates, George included, deny that nature is normative (pp. 39, 60, 61, and 78). One must wonder as well if speculative knowledge of nature, especially the status of teleological understandings, would not at least affect the confidence with which one might affirm the propositions NNL holds self-evident.

Both the force of NNL and its ambivalence on nature are evident in George's treatment of human sexuality, a major concern of this work. George joins other NNL advocates in distancing himself from the teleological understanding of nature that led many to condemn "unnatural acts" as "contrary to the direction inscribed in the reproductive or procreative power" (p. 161). In place of such arguments from nature, he posits the intrinsic value of marriage, whose goodness is known self-evidently, defined "as a two-in-oneflesh communion" (p. 139) and as "the community formed by a man and a woman who publicly consent to share their whole lives, in a type of relationship oriented toward the begetting, nurturing, and education of children together" (p. 168). All sexual relations that are not actualizations of this two-in-one-flesh communion—sodomy (whether homosexual or heterosexual), fornication, masturbation, prostitutionnecessarily treat the body as an extrinsic instrument of the desiring "self" (pp. 6, 147-51, 167-81) and are thus "intrinsically morally bad" (p. 148).

The argument is carefully crafted, yet it replaces degrees and nuances of moral imperfection characteristic of old natural law and more so of natural right (see, e.g., Aristotle, Ethics) with absolute and categorical standards of condemnation. Moreover, its grounding ends up invoking nature in a way that is hard to reconcile with the initial dismissal of teleology. The "oneness" of the "one-flesh" community, for example, is traced ultimately, as George quotes Finnis, to "the behavior that unites biologically because it is the behavior which, as behavior, is suitable for generation" (p. 146). And this "openness to procreation" is described as the "natural fulfillment" of marriage (p. 168). Is this not natural teleology?

There is much to admire in these essays, but until we receive a less ambivalent account of nature, a defense of NNL, even in George's capable hands, remains incomplete.

Democratic Choice and Taxation: A Theoretical and Empirical Analysis. By Walter Hettich and Stanley L. Winer. New York: Cambridge University Press, 1999. 344p. \$59.95.

Robert C. Lowry, Michigan State University

In Democratic Choice and Taxation, Walter Hettich and Stanley Winer advance the argument that fiscal policies in democratic states should be analyzed as "equilibrium outcomes of a collective choice process that is constrained by political as well as economic forces" (p. 1). Although the authors characterize this as a "new approach to the study of taxation" (p. 284), their central premise is similar to that of University of Chicago economists studying regulatory policy (e.g., Sam Peltzman, "Toward a More General Theory of Regulation," Journal of Law and Economics 19 [August 1976]: 211-40) as well as to Alesina and Rosenthal's political economic model of macroeconomic policy (Alberto Alesina and Howard Rosenthal, Partisan Politics, Divided Government and the Economy, 1995). Nonetheless, Hettich and Winer do far more than just extend to tax policy the idea that policies are endogenous outcomes of political processes. They also provide a clear discussion of many issues that must be faced by scholars interested in modeling policy choices in a wide variety of substantive areas.

Hettich and Winer begin by considering the pros and cons of various models of collective decision making that might be used to study tax policy. They argue that the probabilistic voting model, in which every voter may vote for any party with some positive probability that depends on the economic consequences of each party's announced platform, is superior to a number of alternatives. The chief advantage of the probabilistic voting model is that it generates an equilibrium outcome in a multidimensional setting in which decision makers are accountable to voters. A weakness of the model is that it treats the actual decision-making process as a black box, a problem to which the authors must return in their empirical applications.

Having settled on a conceptual framework, Hettich and Winer develop a formal model in which political parties announce fiscal platforms to maximize their expected votes, subject to a budget constraint and a set of relationships specifying the effects of taxes on the private economy. According to the Representation Theorem originally due to Peter J. Coughlin and Shmuel Nitzan ("Electoral Outcomes with Probabilistic Voting and Nash Social Welfare Maxima," Journal of Public Economics 15 [February 1981]: 113-21), constrained maximization of the sum of voter utilities weighted by the sensitivity of each voter's support to changes in his or her welfare at the equilibrium yields the same platform as a noncooperative game between the parties. This equilibrium platform satisfies the condition that the marginal effect on political support per dollar of net tax revenue is the same across all taxpayers.

The result that political support is maximized when marginal effects are equal for all voters yields immediate insights, as it implies that policymakers should set a different effective tax rate for each homogeneous block of voters. In other words, simplified tax systems such as a flat tax are unlikely to be compatible with vigorous political competition. Hettich and Winer argue that the interesting analytical question is why the tax code is not even *more* complicated than we observe. Their answer involves administrative costs and the government's inability to observe taxpayers' true wage rates and effort.

A second implication of their model is that politically optimal tax rates neither satisfy the normative criteria of

horizontal equity nor match the policy prescriptions of optimal tax theory. The fault here lies with normative theories that rely on a benevolent social planner unconstrained by a collective choice process. One can nonetheless engage in normative analysis by focusing on barriers to political competition, lack of perfect information and coordination across jurisdictions in a federal system, and the extent to which political support for tax policies depends on factors unrelated to voters' economic welfare.

The authors then provide several empirical applications, including a general equilibrium model calibrated to compare U.S. tax policy in 1973 and 1983, as well as statistical analysis of the determinants of income tax provisions in American states and the choice between tariffs and debt financing in Canada from 1871 to 1913. The statistical analysis in particular highlights the limitations of the probabilistic voting model. Specifically, the political support function is stated in terms of individual voters, and the formal proof of the Representation Theorem does not account for the possibility of other forms of influence. Yet, a great deal of qualitative and historical evidence indicates that organized interest groups and institutions such as corporations have substantial influence on tax policy. Integrating these efforts into the theoretical model is not trivial, as it is necessary to consider not only the size of the interest group but also its ability to overcome collective action problems. Then there is the question of exactly how these organized groups obtain political influence above and beyond the influence that their individual members have as voters. Formal models that do not distinguish between different kinds of political support do not provide much guidance for developing empirical measures of interest group influence.

Hettich and Winer also recognize that the outcomes from a collective choice process may depend in part on design of the institutions in which policy decisions are made. Therefore, they compare tax policy in a parliamentary system (Canada) to that in a separation of powers system (the United States). This comparison is somewhat ad hoc, and the empirical tests they provide are not formal. Moreover, they do not attempt to relate this analysis to the probabilistic voting model, which takes institutions as fixed and transparent.

Despite these limitations, Democratic Choice and Taxation is an unusually comprehensive and straightforward treatment of the positive and normative theoretical and empirical issues confronting political economists who study policymaking in a democracy. Beyond their specific insights into the design of tax systems, Hettich and Winer provide food for thought for scholars interested in a wide range of fiscal, regulatory, and macroeconomic policies. Even the limitations of the probabilistic voting model provide a clear set of opportunities for further contributions to this scholarly enterprise.

Religious Toleration: "The Variety of Rites" from Cyrus to Defoe. Edited by John Christian Laursen. New York: St. Martin's, 1999. 252p. \$45.00.

Susan Mendus, University of York, UK

John Christian Laursen is a man with a mission. In fact, he is a man with two missions. The first is to expose the flaws in much modern writing on toleration; the second is to draw our attention to the wide range of toleration literature beyond the rather narrow canon beloved of modern political philosophers and political theorists. For Laursen, there are more things in heaven and earth than are dreamt of in John Locke's Letter on Toleration and John Stuart Mill's On

Liberty. There is Cyrus and Defoe, Bayle and Leibniz, Bartolome de las Casas and Juan Gines de Sepulveda. There is Pufendorf, Le Clerc, and Thomasius. There is Confucianism, Judaism, and Islam. In short, and as the subtitle of the volume notes, there is (and always has been) a "variety of rites." Yet, modern political philosophers and political theorists have largely ignored this variety or, at best, have paid it desultory and inadequate attention.

Laursen's volume aims to rectify this state of affairs. "It is" he tells us "the thrust of this book that much of the recent literature [on toleration] has been seriously flawed in one way or another. Errors of history are common... but there are also conceptual problems, such as distortions of ordinary language that have the effect of drawing the discussion away from what is really interesting about tolerance, which is its paradoxical nature" (p. x).

These are not peccadilloes. Given the centrality of toleration to modern political philosophy, and the eminence of the contributors to the debate (Thomas Nagel, John Rawls, T.M. Scanlon, Michael Walzer, Bernard Williams), the twin accusations of historical ignorance and conceptual confusion are of the utmost seriousness. Does the case for the prosecution succeed? The accusation of conceptual confusion is, in fact, confined to Laursen's own, and very brief, "Orientation" chapter, and it is far from compelling. Indeed, it is not always clear what Laursen takes conceptual confusion to be. Sometimes it is the claim that modern political philosophy is abstract and ahistorical ("most studies in recent decades have been written with geographical, cultural and chronological blinders"); at other times it is the claim that modern liberals present as philosophical principle what is in fact merely personal prejudice.

The first allegation is harsh. In recent years there have been strenuous efforts to contextualize political philosophy, both historical and modern. In the history of political thought, the work of Quentin Skinner in particular and of the Cambridge School in general has done much to emphasize the importance of context, while in modern political philosophy the writings of (among others) Alasdair MacIntyre, Charles Taylor, and James Tully have been largely devoted to exposing geographical, cultural, and chronological blinders. Their efforts have not been in vain, and indeed some would say that they have been altogether too successful in moving political philosophy away from its abstract and universalizing tendencies. Whatever the truth on that, Laursen's "blinders" allegation seems like a bad case of crying "Fire!" in Noah's flood.

The second allegation is also questionable. It is true, of course, that many writers are prone to present personal bias under the guise of general principle, and liberal political philosophers are no exception, but Laursen's chosen example is somewhat disingenuous. He attacks Gordon Graham for concluding that some kinds of Islamic fundamentalism ought not to be accorded the freedom and respect of other religious views. What Graham in fact concludes, however, is that in some circumstances toleration may have to be traded off against other values, such as social cohesion and public order. If the toleration of religious belief, for example, threatens social order, then toleration may have to be sacrificed. So Graham is not (as Laursen implies) advocating intolerance of Islamic fundamentalists. He is raising a general question about the relationship between the value of toleration and other important values. Unless we are prepared to say "let toleration prevail though the heavens fall" (an unedifying and possibly incoherent pronouncement), this is a question we must all address, and it is not necessarily a mere prejudice to conclude that toleration will have limits.

In his eagerness to draw our attention to interesting but neglected works in toleration, Laursen overstates the case for the prosecution. We can agree that discussions of toleration would be better, and better informed, if they took account of a wider range of texts. And that is enough. We do not need to go on to imply that modern political philosophers wear their ignorance of these texts as a badge of honor, or that they have some principled objection to including them in their reflections. For myself, I would dearly love to include them in my reflections, but the days of my age are short, and that is why, despite the reservations voiced above, I am grateful to Laursen for making available a range of work on thinkers and events of whom I was, I confess, wholly ignorant.

To cite just two examples. Zhang Longxi's article on the Chinese tradition of toleration offers a highly informative account of Jewish communities in Henan Province from the eighth century onward, while Nabil Matar's piece, "The Toleration of Muslims in Renaissance England," traces the reception of the Islamic faith in fifteenth- and sixteenth-century England. Ironically, given the title of this book, both authors draw attention to the way in which commitment to religious toleration frequently has been constrained by political and economic considerations. Jews in China were tolerated so long as they did not challenge the supremacy of the secular ruler, and Muslims were accommodated partly because their influence was important for trade.

A principle of religious toleration has rarely, if ever, been allowed to trump the interests of the politically powerful, and the resounding message of this collection is that, through the infinite variety of text and context, when all the nuance and subtlety of different times and places have been accommodated, there remains a single problem of toleration: explaining how it can be right to permit what is wrong. This collection contributes much to our understanding of that question, even if it does not provide an answer to it.

The Condition of England Question: Carlyle, Mill, Engels. By Michael Levin. London: Macmillan, 1998. 194p. \$65.00. Morality and the Market in Victorian Britain. By G. R. Searle. Oxford: Clarendon, 1998. 300p. \$85.00.

G. W. Smith, University of Lancaster, England

Writing in 1866 James Fitzjames Stephen declared that the unyielding commitment displayed by the English to the principles of free trade revealed them to be, contrary to the common view, a thoroughly logical rather than a merely pragmatic people. Even so, by the time of the death of Queen Victoria in 1901 laissez-faire had been under intense pressure in Britain for decades, one reason being increasing foreign industrial and commercial competition, another the growth of antiindividualist moral and political ideas associated with socialism of various descriptions. In Morality and the Market in Victorian Britain G. R. Searle takes the high point of the doctrine to be the radical policy of tariff reform represented by the repeal of the Corn Laws in 1846, and "Victorian" means for him the period between 1830 and 1870. Certainly, by the latter date the reputation of the market as being both economically efficient and "natural" was in serious decline and did not rise to similar heights again in Britain until the advent of Thatcherism in the 1980s. Searle's survey embraces a broad range of activities and institutions, and he is convincing in showing how, even at the height of laissez-faire, Victorians were prepared to recognize and contend anxiously with profound moral problems arising from the tectonic pressures exerted upon customary and valued ways of thinking and doing by the apparently relentless advance of commercial society. Logical or not, Searle shows that they were never doctrinaire.

The author presents a wide range of detailed examples to illustrate the Victorian response to the permeation of market ideas, including the question of the moral standing of capitalism and of profits (frauds, joint liability, entrepreneurialism, business integrity), slavery, problems of poverty and pauperism, the effect on domesticity and women (political economy and the "woman question," contract and marriage, prostitution), the principles and practice of charity-giving, the liquor question and temperance reform, gambling and betting, militarism and the just war, the ethical standing of professions (advertising, professional competition, and so on). God versus mammon is, as one would expect, a major theme: the injunctions of the Sermon on the Mount versus buying cheap and selling dear, and the duties of charity versus the merciless imposition upon the destitute of the "lesser eligibility" principle of the political economy-inspired Poor Law.

Searle well brings out the ethical parameters within which Victorians wrestled with these contending values, particularly the moral easement afforded by the fact that the economic principles in terms of which the claims of mammon were defended were themselves highly moralized anyway via notions central to the tradition of political economy from Adam Smith to J.S. Mill, especially the notion of self as "character" and the associated edifying view of the connection between market competition and the Smilesian cardinal virtues of individual independence and self-reliance. In these terms even the predicament of the anguished cleric (cited by Searle), torn between the precepts of the evangel and the injunctions of political economy on the question of whether bibles should be given away or sold to the heathen at full market price, is perhaps (just) understandable. Indeed a vein of fascinating incidental information runs through Searle's entire account. How many readers know that Sir Robert Peel, inventor of the English police force, secretly and illegally sanctioned free trade in corpses (for the medical dissection business) eighteen years before he legislated free trade in com?

Apart from its strictly historical value, however, this book will, or ought to be, of particular interest to economists, political scientists, and political theorists, among whom there is perhaps still a tendency to theorize questions of markets and morals in sublime neglect of time, place, and circumstance. The message needs to be heard with some caution, however. Searle's political subtext is that the Victorian attempt to set moral limits to the Carlylean "cash nexus," far from being negative in its effect, contributed to the long-term stability of the market in Britain, something that the author believes needs now to be essayed again in post-Thatcherite Britain. The problem is that Victorian experience can offer but limited help here. Although the intellectual currency of the Victorian markets and morals debate was largely that minted by the great political economists themselves—Smith, Malthus, Ricardo, and Mill-it was inevitably, given the context, carried on in the form in which their economic ideas actually sedimented themselves in the popular consciousness, via national political debates over the Corn Laws and the like, by way of popularizations of the principles of political economy by Harriet Martineau and Mrs. Marcet, and through novels critical of hard-nosed "Manchester" liberalism by the likes of Charles Dickens and Mrs. Gaskell. Consequently, the discourse is saturated with Victorian cultural assumptions long ago discarded, and in any event the moral values inscribed in the conceptual framework of classical political economy—character, the place of labor in wealth creation, merit and reward in the market, and so on—no longer carry, especially after Hayek, that kind of authority. Moreover, after 1870, collectivists of various stripes entered the ring to challenge the entire notion of the legitimacy of individualistic market relations. These, too, are now equally obsolete. But the combined result is that the inheritance of thinking on morality and markets is currently, at least in the British context, so profoundly problematic that Victorian ideas appear to have lost virtually all moral purchase.

Thomas Carlyle coined the phrase "The Condition of England Question" in his prescient tract for the times, "Chartism" (1839). The 1840s was a decade of profound social and political difficulty for Britain: deep economic depression, Irish famine, unsettling revolution in Europe, and unprecedented mass agitation (Chartism) in Britain. In what is basically a teaching text, Michael Levin has the idea of using the responses of Carlyle, Engels, and J. S. Mill to these events as a way into, and as a useful touchstone for, their respective social theories. All three writers regarded the repeal of the Corn Laws as a political climacteric, representing a decisive step in the shift of power from the aristocracy to the middle classes. Beyond that there was little in common. For the semisecular prophet Carlyle, English troubles were but a symptom of a human, especially aristocratic, moral failing, and the solution was "great men" and firm government. For the German revolutionary Engels, only the abolition of the entire class system and the end of worker exploitation would answer. Mill was much less apocalyptic than either, looking instead to a gradual amelioration of conditions arising from government carried on with proper respect for principles of political economy.

Carlyle comes away best from Levin's "snapshot" technique as, unlike the others, his position never really developed; his voice simply became louder and more irritable. And it works well enough for Engels, although his analysis of England's woes in his 1844 The Condition of the Working Class in England is basically inchoate, awaiting the benefit of the theoretical stiffening soon to be supplied by Marx. As the most open-minded and reflective of the three, Mill suffers most. Levin relies upon Mill's journalism on the Irish famine, his review of the "Claims of Labour," and the first edition (1848) of Principles of Political Economy. The latter is surely the major piece of evidence, but in the course of its seven editions Mill's view of the causes of poverty, and of the role of the working class in countering the problem, evolved from one of passivism to significant active participation. These reservations aside, Levin presents a well-judged mixture of history and theory in a book that teachers of nineteenthcentury political ideas will welcome.

Early Modern Skepticism and the Origins of Toleration. Edited by Alan Levine. Lanham, MD: Lexington Books, 1999. 282p. \$60.00 cloth, \$22.95 paper.

Cary J. Nederman, University of Arizona

Until quite recently, the history of religious toleration in Europe was a dreary narrative in the literature of political theory. As the story is recounted, the monolithic character of Latin Christianity rendered tolerance a theoretical as well as practical impossibility. With the Reformation came an unprecedented opportunity for the emergence of new structures capable of supporting tolerant practices; and the rise of liberalism in the seventeenth century can be credited with supplying the conceptual principles on which the pragmatic gains achieved during the Reformation could be grounded.

The story pits a heroic few—John Locke, J.S. Mill, and some of their sympathizers—against a vast conspiratorial network of "authoritarians" who would suppress freedom at any cost. This tedious comic book version of the modernizing Enlightenment tale remains popular among those unfamiliar with the cutting edge of scholarship, but advances in the historical literature call it into serious question as an interpretation of the record.

Many of the contributors to this collection make further substantial advances in the scholarly dissent against the conventional narrative of toleration. In doing so, they are guided by the dual goals espoused by the editor in the Introduction: to advance an historically plausible account of the unfolding of tolerant thought while also exploring the contemporary relevance of these ideas for current theories of toleration. At their best, the chapters meet these aspirations very well indeed. Maryanne Cline Horowitz's masterful presentation of the "free thinkers," who, under the influence of Bodin, wrote in the era immediately following the Edict of Nantes, demonstrates the breadth and power of the intellectual arsenal arrayed against the enemies of toleration. Although many of the figures she surveys are unknown to all but the most specialized historians of political thought, their ideas more than stand up when compared to English-speaking early modern advocates of toleration. Similar cases are made for the historical importance as well as relevance of several other authors or traditions commonly ignored in the literature on tolerance in sixteenth- and seventeenth-century Europe. Deserving special mention are Steven B. Smith on Spinoza, Alan Craig Houston on the Levellers, Kenneth Weinstein on Bayle, and Patrick Riley on the philosophes.

The theme that is supposed to hold together this diverse array is the relationship between toleration and another emerging trend in philosophy of the early modern period, skepticism. I am less convinced than Levine, however, that the volume fully accomplishes this aim. Levine's own essay on Montaigne is a paradigm for how the themes may fruitfully be joined. But too often skepticism is highlighted to the detriment of toleration, or vice versa. It is hardly feasible to equate "skepticism" with something like "chastened reason," as Joshua Mitchell does in order to make the case for a tolerant dimension in the writings of Calvin and Luther. And how comfortable can we be with Descartes's skepticism as a basis for toleration when even his advocate, Michael Allen Gillespie, admits that blasphemy, atheism, polytheism, and any questioning of God's existence do not merit the protection of Cartesian tolerance, since they all violate one or another tenet of manifest reason? At the other extreme, some essays—such as those by Houston, Nathan Tarcov on Locke, and Diana Schaub on Montesquieu—barely touch upon skepticism at all, focusing instead upon toleration.

Part of the problem may be a failure in the volume to define the meaning of skepticism very precisely. For some contributors, it seems loosely to designate any position of doubt about human epistemic capabilities; for others, it seems to pertain to a narrow and rigorous set of doctrines. It is certainly true that early modern skepticism embraced a range of positions, but this does not exclude the possibility of identifying some common standard of what renders an argument minimally skeptical. If such a question had been posed, of course, the volume as published might have a somewhat altered table of contents.

Close attention to the detailed arguments of original texts is a hallmark of all the contributions. Unfortunately, there is less consistency in careful examination of the secondary scholarship. No mention is made of Preston King's classic

1976 book (recently reprinted), Toleration, with its powerful attempt to connect the conceptual principles of skepticism to those of tolerance. Reference to Richard Tuck's classic essay, "Skepticism and Toleration in the Seventeenth Century," which offers significant historical evidence against King's thesis, is also noticeably absent from any of the chapters. Those familiar with the literature on skepticism will be surprised to find no citation of J.C. Laursen's 1992 study, The Politics of Skepticism in the Ancients, Montaigne, Hume and Kant.

Given the large number of scholars who have usefully investigated the topic of Lockean toleration, Tarcov's complete refusal to engage (even to recognize) these commentators detracts from one's ability to evaluate the worth of his own contribution. And those who follow recent research on early modern theories of tolerance may wonder why Gary Remer's several articles and his 1996 volume, Humanusm and the Rhetoric of Toleration, merit no acknowledgment. More generally, the contributors seem unaware of the large body of literature on the historical development of tolerance that has appeared during the past decade or so in continental Europe, including work by Klaus Schreiner, Mario Turchetti, Simone Zurbuchen, and Antonio Rotondò.

Finally, the typographical errors are excessive in a book whose contributions are of such high quality. It is incumbent upon publishers to demonstrate the same sort of concern for the presentation of volumes under their imprint as authors and editors show in the impeccability of their research. Nonetheless, Levine and his contributors must be congratulated for producing a uniformly learned and elegant set of inquiries into the foundations of early modern toleration.

The Noblest Minds: Fame, Honor, and the American Founding. Edited by Peter McNamara. Lanham, MD: Rowman & Littlefield, 1999. 256p. \$60.00 cloth, \$22.95 paper.

George W. Carey, Georgetown University

In Federalist 72, Hamilton characterized "the love of fame" as "the ruling passion of the noblest minds." Some 35 years ago, the noted historian Douglass Adair, in an effort to show that the motivations of the Founders extended well beyond narrow and selfish economic interests, built upon Hamilton's observation. He advanced the proposition that the Founders, or most of them at any rate, were motivated by "the love of fame," a passion that reconciled self-interest with the pursuit of noble goals that advanced the common good. This collection of essays is devoted to a close examination of Adair's thesis. Each of the seven contributions that comprise the heart of this volume (Part 2), although they differ in emphasis and scope, deals with a major figure of the founding period and addresses "three basic questions: what the subject of the essay thought of fame, what role the love of fame played in his life, and how and in what way he won fame" (p. vii). What emerges is a picture of the Founders' motivations far too complex to be understood simply in terms of "the love of fame."

Paul Rahe, whose "Fame, Founders, and the Idea of Founding in the Eighteenth Century" constitutes the whole of Part 1, significantly undercuts Adair's contention by noting that the Founders, unlike "the ancients," never "wholeheartedly embraced the ethos of honor and fame" (p. 26). James Wilson, he remarks, in stressing the "primacy of private life" (p. 28) in the first of his Lectures on Law, expressed "the reigning opinions" of the founding era (p. 29). Rahe concludes that "the Founding Fathers...never gave full rein to their longing for fame," although they did seek "a measure of

greatness as statesmen and, in some cases, also as generals" (p. 29).

James Ceasar's "Fame and The Federalist" (Part 3), raises still another concern with Adair's thesis. The author acknowledges that "it is...clear that a desire for fame was an important spur to action for many of the Founders," he comments that Adair's "desire to trump his colleagues's" narrow and base depiction of the Founders' motivations may have "led him too quickly to discount the motive of justice and pure patriotism" (p. 192). Indeed, Ceasar observes, the authors of The Federalist acquired fame for their efforts, although the "love of fame...was not the chief motive of writing the book" (p. 194).

In one fashion or another, the majority of the essays in Part 2 deal at length with the question of whether love of fame can adequately account for the Founders' behavior and accomplishments. John Adams's understanding of motivation, on C. Bradley Thompson's showing, perhaps comes closest to conforming with that of Adair. Adams, as Thompson informs us, believed "benevolent fame is connected to higher principles that the honorable man seeks for selfish reasons" (p. 77). In contrast, Robert Faulkner points out that John Marshall, greatly influenced by the example of George Washington, took his bearings from his "sense of patriotic duty" (p. 177). At a more elevated level, Marshall's heroes, Faulkner notes, were those who resembled Aristotle's "great-souled man" (p. 178), that is, one whose "soul inclines to actions and activities worthy of the superiority of his soul," to a "loftiness or dignity of outlook" (p. 179). Such a view, Faulkner believes, stands outside "a psychology of fame-seeking" (p. 178). In the same vein, Lorraine and Thomas Pangle write that "the love of fame is not adequate as an account of Washington's motives as he understood those motives" (p. 62). His principal motivation, they maintain, was "virtue or true honor," based on a "sublime self-love . . . a love of one's soul that one longs to make as fine and as splendid as possible, by claiming for oneself the most worthy actions" (p. 70).

Peter McNamara, in his essay on Alexander Hamilton, takes care to note that Adair put both Hamilton and Benjamin Franklin in a special category because both sought to rise from their "lowly circumstances" so that "their high ambition" could not be attributed to the "Revolutionary situation" (p. 142). Acknowledging that "the love of fame was the ruling passion of Hamilton's remarkable and controversial life" (p. 141), McNamara notes a complex relationship among fame, ambition, and virtue in Hamilton's thinking and behavior. For instance, Hamilton regarded "the love of fame" as a "peculiar kind of ambition," as a "laudable ambition" or one "governed by principle," such as those dictated by "justice" and "natural rights" (pp. 151-2). Franklin, according to Steven Forde, pursued a different path to fame than Hamilton or, for that matter, than any of the Founders. Although he grew up in an age "in which the notion of fame described by Douglass Adair had become a reigning ideal" (p. 39), he "repudiated neoclassical notions of heroism" because he anticipated "that a new type of individual and new type of fame were foreordained for the coming democratic age" (p. 40).

Lance Banning's discussion of Madison focuses on how "modern scholarship has skewed our memory of Madison's career in ways that might have seemed both curious and painful to himself or his contemporary allies" (p. 124), only superficially touching upon Adair's thesis. Likewise, David Mayer chastises modern scholars for their failure to preserve or to convey accurately "Jefferson's ideas about government" (p. 97). Mayer sets forth salient aspects of Jefferson's thought

and major accomplishments, but his essay does not deal with the intricacies surrounding motivation.

The final essay, by Thomas Pangle, uses the lives of Washington and Winston Churchill as points of departure, to explore "a series of deep puzzles concerning the nature and status of honor" (p. 207), such as how it can be "just or reasonable for the few unselfish and public spirited men of honor to expend their lives, in the role of servants to the predominantly selfish or privately interested many" (p. 209). Among his more significant conclusions is that modern liberal theory is incapable of comprehending what motivates such "men of honor" (p. 218).

This is not a closely knit collection. The essays on Madison and Jefferson are largely of a different order than the others, and some contributions overlap to a considerable degree in their treatment of individual Founders. Nevertheless, on the whole, the authors point up the shortcomings and complexities of using "the love of fame" in the manner suggested by Adair. This collection would serve as excellent outside reading for courses in American political theory or for those that focus on the founding period.

The Political Institution of Private Property. By Itai Sened. New York: Cambridge University Press, 1997. 204p. \$54.95.

Jeffrey S. Hill, Northeastern Illinois University

A friend of mine once characterized rational choice theory as "slash and burn political science," arguing it tries to answer questions as if they had never been asked before, ignoring or dismissing well-established bodies of literature. Nowhere is that less true than in Itai Sened's analysis of the origins of property and other individual rights. Sened develops his own theory by combining rational choice analysis with a careful and complex review of several theoretical approaches. He examines in detail the work of classical political theorists (e.g., Hobbes, Locke, Rousseau, and Hume), classical and neoclassical economic theorists (e.g., Stigler, Coase, Demsetz, and North), and game theory. Along the way, he develops a new understanding of the origins of rights, produces several nonobvious implications, and supports his argument with historical illustrations and an empirical analysis of a special kind of property right: airport landing and take-off time slots.

Sened begins with a review of classical political theory, rejecting Locke's thesis that governments are created to protect preexisting rights. While he prefers the more Hobbesian view that rights can only exist where there is a strong, stable government, he argues it is incomplete. Why would any such government grant rights? There is no moral imperative to grant rights, and doing so would have the effect of restricting what the government can do.

Sened finds only a partial answer to his question in classical and neoclassical economic theories. Many of them deal with it, at least implicitly, but most of them assume governments exist to protect the property rights necessary for an efficient market. This is not a sufficient answer. Creating rights for some places a burden on others, who must now forgo or pay for what they previously enjoyed for free. Rights also create work for the government, since they must be enforced if they are to be effective. We still do not know why a government would provide a right that constrains people (including itself) from using things and that requires additional effort to protect the right. Borrowing a quote from North, the question becomes why a state uses "its coercive forces to grant

and protect private property and related individual rights rather than to rob its citizens of their assets" (p. 50).

For his answer to this question, Sened uses a game theoretic approach. The creation of rights cannot be explained by the Invisible Hand, benevolence, or altruism. Instead, using the basic rationality assumption, he suggests governments create rights because it is in their interest. More specifically, governments create rights in return for political and economic support from their citizens.

The political support motivation can be seen in the creation of the Bill of Rights. These amendments were originally rejected at the Constitutional Convention. "They were added to the Constitution to make it attractive enough to the opponents of the Constitution" (p. 30, emphasis in original). The Bill of Rights may indeed be an example of the wisdom of the Founders, but it was added to buy support. This example shows how Sened's approach provides an explanation for the granting of rights, but, as the author points out, it also shows an assumption that "governments pursue their own interests does not imply that they are insensitive to the interests of their constituencies" (p. 30). A better illustration of this point is seen in one small section of the Magna Carta, which granted widows the right to refuse the king's order to remarry. This right was not granted out of any sense of altruism or respect for women's rights. It was demanded by the barons who challenged King John, since monarchs had previously used remarriage to rob the barons of their property. King John, in turn, granted this restriction upon himself in order to gain the support of his rebellious barons.

Sened uses a similar approach to explain the need for economic support. Without property rights, no production takes place, because the benefits of production are not protected. Only when government creates rights to protect producers will markets develop. But where is the incentive for government to do this? The answer is that the increased wealth created by the market becomes a source of economic support for the government. The conditions necessary for markets are not created out of respect for economic efficiency. They are created to provide tax revenue. For the same reason, governments will not always establish property rights. Since there is a cost to enforce these rights, they will only be granted when the expected benefits of taxes and political support exceed this cost, that is, when the gain in revenue is greater than the cost of enforcement, and when the gain in political support from rights holders is greater than the loss in political support from "duty bearers" (i.e., those obligated to respect the rights). Since governments cannot be certain when these conditions will exist, they will look for information. It is supplied by interest groups and political entrepreneurs, who make government aware of potential sources of support that can be obtained in return for the granting of a right desired by the group.

Some may see this as a trivial argument, whereas others may see it as simply an extension of economic arguments for limited government. In both cases they would be wrong. Sened's contribution provides a subtle twist on the more popular economic arguments on taxes. Taxes are not seen as an intrusion into a previously existing market but as the reason markets can exist. Not all taxes are necessarily beneficial, but without them government would have no reason to provide the protections needed for a market. Similarly, Sened's model suggests interest groups and political entrepreneurs are not threats to the efficiency of the system but instead are necessary solutions to uncertainty. Although the intervention of these groups may lead to economic inefficiencies, their participation is vital if the rights are to exist at all. "Without political intervention, there is little chance property

rights, so crucial for the price mechanism to work..., would ever be established or maintained" (p. 117). Viewed this way, interest groups are more than simply necessary; they are part of "the game of politics...[that] makes both governments and their constituents better off" (p. 117).

Perhaps most important, the analysis provides hope for the creation of rights in places where they still do not exist. Sened shows rights are not the result of benevolent governments. A selfish government is just as likely to produce institutions protective of rights, since it benefits from their creation. This is hopeful because selfish governments cannot otherwise be trusted to be benevolent, and benevolent governments cannot be trusted to exist.

The strengths of this book are such that I hesitate to mention any shortcomings, but there are occasional side comments that require either explication or elimination. For example, Sened explains that heavy pockets of crime exist because the cost of protecting rights exceeds the political and economic benefits. There may be some merit to the argument, but crime is more complex than this suggests. It is not an important part of Sened's larger argument and could easily be dropped or ignored.

In general, the book is a valuable addition to the literature. Its arguments are dense, but the presentation is clear, and the chain of reasoning is continually summarized and restated as it is developed. Readers unfamiliar with game theory will have difficulty following the technical parts of the argument, and those unfamiliar with political theory may have difficulty following the nuanced review of classical political theorists, but all should stick with it, since the remaining parts of the book are worth the effort. For these reasons, the volume is most appropriate for a motivated, advanced class of undergraduate or graduate students. These groups, as well as other political scientists, will find here an excellent illustration of formal, analytic theory as a tool of political science, not just as a subfield of the discipline. The book leads to subtly different views and new answers to established questions in political science.

Democratic Justice. By Ian Shapiro. New Haven, CT, and London: Yale University Press, 1999. 333p. \$29.95.

David Miller, Nuffield College, Oxford

This well-written and engaging book sits at the intersection of political theory and public policy. It lays down and applies principles to determine who should be allowed to make decisions of different sorts if justice is to be promoted. Broadly speaking, Shapiro takes a pluralist position. This is so in at least the following three senses: He believes that decision-making power should be dispersed in a democratic society, so that different kinds of decisions are taken in different places by different people; he believes that the authority structure should also vary from one site to the next, depending on the kind of decision being taken, the relative competence of the various parties to it, the costs of exit, and so on; and he believes that power should be divided within each of these decision arenas, with minorities having channels through which they can express their opposition to the actions of the principal agents.

The general provenance of these ideas, from Madison to Dahl and beyond, will be familiar to readers of the APSR. Perhaps what is most original in Shapiro's book is less his general understanding of a pluralist democracy than his application of that idea to areas of life often regarded as not political at all. Indeed, Shapiro says rather little about democratizing the state itself. Instead, he looks at four main

questions: authority over children, and especially the proper division of powers as between parents and public officials; the legal framework of marriage (responding here especially to feminist concerns about the inequalities of power and resources that pervade the traditional institution of marriage); the control of work, under which heading Shapiro investigates a range of proposals for democratizing the employment relationship; and responsibilities for the elderly, including questions about the distribution of medical resources and decisions about terminating life.

Shapiro's approach, which in effect asks what would it mean to govern each of these areas of life by the democratic principles laid down at the beginning of the book, is fresh and instructive. It has to be said that it does not yield any radically new policy proposals. This is partly because Shapiro observes Rousseau's injunction to take people as they are and laws as they might be, and so he builds a good deal of contextual constraint into the picture. I felt this particularly acutely in the chapter on work. After sketching in the main alternatives to the conventional capitalist organization of work—ESOPs, worker-owned firms, codetermination, and so forth-and identifying difficulties with each proposal, Shapiro concludes somewhat pessimistically (or realistically if you prefer) that the most we can hope for is legal regulation of employment and effective representation of workers' interests by trade unions. "Whatever the disadvantages of unions, to date no alternative form of industrial organization has come along that holds out any hope of doing better" (p. 189). This is surely too gloomy. Without descending into utopia, political theorists should start by delineating the best forms of social and political life, even if they cannot presently see how to get there starting from here.

Although the main focus of the book is on making decisions democratically, Shapiro is also interested in the justice of the decisions made (hence the title of the book). His general view of the relationship between democracy and justice is surely correct: These are two distinct values, and it is wrong to think that laws or policies must necessarily be just simply because they are democratically enacted; yet, the linking of the two in the popular mind is no accident. The theorist's task, according to Shapiro, is to discover forms of democracy that are likely to promote justice and principles of justice that are suitable for implementation by democratic means. It is not so clear, however, how Shapiro wants to place his project in relation to theories of justice of the more conventional kind, such as that of Rawls, which attempt to specify the socially just distribution of rights, liberties, resources, and other such goods. At times, he appears to see his democratic theory as complementing such accounts, by describing the institutions and procedures needed to realize an independently defined ideal of social justice. At other times, he appears to regard his theory as displacing such accounts, in the sense that justice is to be defined as whatever outcomes properly democratic decision procedures will produce. In this latter vein, he attempts to get some mileage out of the fact that theorists of justice-Rawls, Dworkin, Walzer, and so forth-notoriously offer competing accounts of what justice means. The argument here is: Since we can never agree about what justice, substantively, requires, we must instead fall back on democratic procedures as the means to resolve our practical conflicts in a just manner.

But this argument is too quick. It does not follow from the fact that theorists disagree about justice that there is no right answer to be found, any more than it follows from the fact that theorists disagree about democracy that there is no best account of what makes decision procedures democratic. Just as Shapiro is at his strongest when thinking creatively about

how difficult decisions ought to be made, he is at his most vulnerable when handling substantive questions of justice (see, e.g., his too-rapid dismissal of Dworkin's account of just health care, pp. 212–5). Indeed, I would say that what Shapiro needs in order to complete his argument about justice-promoting democracy is precisely a more fleshed out account of social justice itself. This gap manifests itself in a number of places but especially perhaps in the unexplicated idea of basic interests, which plays a key role in the discussion of the government of children in chapter 4 and in the discussion of the organization of work in chapter 6.

Theorists interested primarily in justice may, then, come away from the book feeling a little frustrated. In contrast, democratic theorists and students of public policy will enjoy, and learn from, Shapiro's well-informed and sensitive discussion of a set of policy issues that increasingly concern citizens in liberal democracies.

The Promise of Green Politics: Environmentalism and the Public Sphere. By Douglas Torgerson. Durham, NC: Duke University Press, 1999. 218p. \$49.95 cloth, \$17.95 paper.

John M. Meyer, Humboldt State University

There is now a blossoming of literature that explores the relationship between environmentalism and political thought. Long overshadowed by environmental ethicists, on the one hand, and environmental policy analysts, on the other, this body of writing is distinguished by its explicit engagement with concerns familiar to political theorists. New books on "green" political thought offer in-depth treatment of such themes as pluralism, social justice, rationality, virtue, and property rights. Douglas Torgerson makes a significant contribution to this new literature; his book raises important questions about the conceptions of politics and about the relationship of means to ends within contemporary environmentalist politics.

Instrumental rationality and its embodiment in "the administrative mind" are the primary subjects of critique in this book. At their core is a tragic seriousness that Torgerson finds central to the project of control and domination of nature from which greens vehemently dissent. As an alternative, he points to manifestations of the comic and the "carnivalesque" in environmentalism: early German Green Party representatives in the Bundestag who deliberately flouted standards of dress and decorum, irreverent Greenpeace banners hung from dams and nuclear power plants, the festival that was Earth Day (p. 93). At moments such as these, we might come to see political action as fun (p. 155). Where others have seen these qualities of environmentalist political action as either irrelevant or problematic (e.g., Robert Goodin, Green Political Theory, 1992), Torgerson presents them as constituting a vital alternative that highlights our human fragilities and deflates the pretenses of the administrative mind (p. 87). They are manifestations of what he calls a "performative green politics valued for its own sake" (p. 154), a concept that relies heavily upon Hannah Arendt's distinctive account of the intrinsic value of action within the sphere of the political.

There is much to admire in this book. I commend Torgerson for attending to the importance of our conceptions of politics in relation to environmentalist critiques. He is also persuasive in his call to move beyond often sterile debates that seek to establish the "true" foundation for environmentalist action. In contrast to many thinkers who see deep divisions among those professing environmental concern (i.e., "deep" versus "shallow" ecology; "ecocentrism" versus

"anthropocentrism"), Torgerson advocates an embrace of the "inescapably broad and diverse nature of the green movement," all varieties of which are a part of what he terms the "green public sphere" (p. 25). It is the allure of instrumentalist thinking and strategizing, he argues, that leads us to the mistaken belief that these divisions are of central importance. Finally, Torgerson's engagement with the literature on policymaking—in addition to that of environmental politics and contemporary political theory—enables him to write insightfully about the administrative practices that he critiques and promotes a dialogue with potential to enrich all three fields.

Despite these strengths, two central ambiguities seem unresolved. The first is the relation of Torgerson's green public sphere to the politics of the state. As a point of comparison, John Dryzek-identified by Torgerson as a significant influence upon his ideas—explicitly presents democratization in the public sphere or civil society as an alternative project to the democratization of the state (Dryzek, Democracy in Capitalist Times, 1996). Yet, it is not clear that Torgerson does or can embrace this view. His focus upon policy processes would be incoherent in the absence of a critical engagement with state authority. Conversely, it would be wrong to conflate the aim or function of a green public sphere with the takeover of state power. Given Torgerson's salutary and provocative discussion of "politics," a greater effort to explicate this relationship could have offered further insight.

The second ambiguity regards the status of instrumentalism for green politics. Although Torgerson emphasizes a noninstrumentalist stance, he is also quick to note the irony here: "Even though a key element of the green critique of modern culture is to reject instrumentalism as a prevailing orientation, desperate green concerns markedly reinforce an instrumentalist conception of politics" (p. x). The resulting tension is acknowledged throughout Torgerson's analysis. Nonetheless, the implications are never quite worked through. Although he challenges instrumentalist approaches to both politics and environmentalism, he often equivocates when it comes to defending his alternative conception. Even near the end of the book, self-critical questions threaten to overwhelm Torgerson's advocacy of a noninstrumental politics: "the very idea . . . seems bizarre—virtually a contradiction in terms, a denial of all that makes green politics important" (p. 154). Part of his answer to this virtual contradiction is to balance a noninstrumentalist ("performative") conception of politics with two others (termed "functional" and "constitutive" politics) that have a more instrumentalist flavor. Yet, this does not fully resolve the difficulties that he admits are present in his most distinctive argument.

In articulating his "performative politics," perhaps Torgerson has drawn the wrong lesson from Arendt. Careful to respect the distinctiveness of her conception of the political, he places much emphasis upon both its expressive dimension—in contrast to an administrative mindset—and its exclusion of what Arendt terms "the social question" as part of its radically noninstrumentalist character, in contrast to an emphasis upon political outcomes. The consequence, however, is that it is difficult to see how this conception of politics can be labeled in any sense green. Greenpeace bannerhanging, for example, is quite clearly expressive, but it is not devoid of an intended effect. Does this locate it within an instrumental or an intrinsic realm of politics? If the answer is the former, then the purity of intrinsically rewarding political action seems preserved only by emptying that politics of all substance or content, a consequence hardly consistent with environmental concerns. Yet, to suggest that the bannerhangers are pursuing the intrinsic rewards of acting politically is to ignore or deny the deep commitment to achieving the environmental goals that they espouse. This seems equally problematic and unconvincing.

Torgerson acknowledges at other points that he takes liberties with Arendt's thought, but his close adherence to her formulation of the political here contributes to this unworkable dichotomy between the instrumental and intrinsic value of politics. Hanna Pitkin's reconstruction of Arendtian politics might offer assistance here. Pitkin ("Justice: On Relating Public and Private," Political Theory 9 [August 1981]: 327-52) argues convincingly that while Arendt appears to protect her conception of the political from virtually all extrinsic concerns, in fact "no account of politics or the public can be right that wholly empties them of substantive content, of what is at stake." She concludes that it is not truly the entry of social and economic (and, we should add, environmental) questions that threaten Arendtian politics but, rather, "failing to transform [them] in political activity, letting [them] enter in the wrong 'spirit'" (p. 346). If Pitkin is right, and I think that she is, then we should be able to embrace the green critique of instrumentalism that Torgerson elaborates and at the same time honor the fact that even the most creative or expressive forms of environmental activism—if at all meaningful—have a purpose or an end outside themselves.

Law and Disagreement. By Jeremy Waldron. Oxford and New York: Oxford University Press, 1999. 332p. \$65.00.

Donald A. Downs, University of Wisconsin

I once attended a lecture in which a famous law professor declared that the time had arrived to abandon critiques of judicial activism in the name of rights because "we now have available the definitive public philosophy upon which constitutional adjudication may rest, that of John Rawls." In Law and Disagreement, Jeremy Waldron provides serious arguments against every tenet of this smug thesis.

Waldron argues that such general theories of justice and rights as those of Rawls and Ronald Dworkin are flawed because they disrespect politics, which consists, first and foremost, of disagreement over fundamental principles. Rawls's notion of "public reason" holds that although we might disagree over particular conceptions of the details of justice, we nonetheless "still agree in accepting a conception's more general features" (Rawls, Political Liberalism, 1993, p. 226). Waldron refuses to take a bite of this apple: "We should pause to consider how remarkable this view is. In the world we know, people definitely disagree—and disagree radically—about justice. Moreover, their disagreement is not just about details but about fundamentals" (p. 153). The inescapable fact of disagreement means we must engage in politics, which involves making a community out of the plurality of perspectives that constitutes the human world. "Politics exists, in Arendt's words, because 'not man but men inhabit the earth and form a world between them" (p. 112).

Waldron's theory points to renewed respect for democratic politics and its ultimate product, legislation. Yet, Waldron is not dreamy about the nature of democratic politics. He has little patience for what he calls the "dewy-eyed" school of "deliberative democracy," which stresses conversation and the achievement of consensus as the essence of democratic governance (pp. 91–3). Rather, he is interested in establishing a hard-headed defense of democratic institutions (especially legislatures) based on the authority they earn by the very act of passing binding, formal law in the context of disagreement.

In the first of the book's three parts, Waldron constructs an original "jurisprudence of legislation," which he presents as an antidote to the "discomfort with democracy" that is contemporary legal theory's "dirty little secret" (p. 8). Legal philosophers are "intoxicated" with courts and the charms of constitutional adjudication. But the condition of fundamental disagreement does not stop magically short of the judicial door. Judges disagree among themselves just as much as citizens and legislatures and "make their decisions, too, in the courtroom by majority voting" (p. 15). A "genuinely democratic jurisprudence" must take legislatures seriously.

Legislative enactments are entitled to special respect for several reasons. As Joseph Raz has argued (The Authority of Law, 1979), it is often advisable on pragmatic grounds to follow decisions made by some other body than to have to figure out what to do by oneself; legislative procedures and vote counting are ultimately the best methods for coordinating the conflicts that comprise any polity. (Waldron discusses Condorcet's theorem that the probability of reaching a valid judgment increases with each additional vote, so long as each voter is more likely to be right than wrong, and Aristotle's argument that judgment of a collective body can be superior to that of the individual because more viewpoints are likely to be entertained.) Finally, respect for legal enactment is "the tribute we should pay to the achievement of concerted, co-operative, coordinated, or collective action in the [pluralistic circumstances of modern life" (p. 101).

This understanding leads Waldron to endorse a position similar to Justice Antonin Scalia's textualism (A Matter of Interpretation, 1997). He rejects a jurisprudence based on original legislative intent because there is no single legislative intent except in rare cases. The authority of law is "its emergence, under specified procedures, as a 'unum' out of a plurality of ideas, concerns, and proposals, in circumstances where we recognize a need for one decision made together, not many decisions made by each of us alone" (p. 144).

Part 2, "Disagreement in Principle," provides the epistemological foundation of the argument. Examining Rawls's notion of public reason and the model of legal "integrity" Dworkin presents in Law's Empire (1986), Waldron maintains that "moral objectivity" is a quixotic quest because of the conspicuous diversity of views about justice and the fact that moral realists (unlike natural scientists) have provided no method by which we can settle fundamental moral disputes (pp. 176–80). To be sure, we can reason together and reach tentative moral conclusions. This is what legislatures do, and, Waldron attempts to show, there is precious little evidence that courts do it any better.

In Part 3, Waldron concedes Dworkin's claim in Freedom's Law (1996) that some rights are essential to democratic legitimacy and that appealing to majority decision making to settle the status of such rights is "question-begging." Yet, he maintains that appealing to judicial review is just as questionbegging and is improperly paternalistic, to boot. Constitutional "precommitment" to nondemocratic means of resolving disputes about rights (i.e., judicial review) violates democratic authority and the principle of disagreement. Dworkin and other advocates of judicial review look to courts to find "right answers" about rights, but such arguments ignore Hobbes's fundamental teaching that "any theory that makes authority depend on the goodness of political outcomes is self-defeating, for it is precisely because people disagree about the goodness of outcomes that they need to set up and recognize an authority" (p. 245). The only right that Waldron would bind by constitutional precommitment (the "right of rights") is the right of equal participation, "whose exercise seems peculiarly appropriate in situations

where reasonable rights-bearers disagree about what rights they have" (p. 232).

Waldron would have strengthened his argument had he provided a more meticulous comparison of judicial and legislative protection of rights. The fact that courts encounter the same disagreement as legislatures does not necessarily mean that they are not better over the long haul in protecting rights that matter to democracy. And although Waldron's theory is a needed antidote to the cynicism about democracy that he rightly deplores, at times he seems to veer too far in the opposite direction. American constitutionalism has traditionally been at its best when it embraces a creative tension between trust and distrust of democracy. Along these lines, what are the implications of essentially doing away with a practice by a co-equal branch of government that has become an established part of America's long tradition of constitutional law? In historical context, does Waldron's position ironically embody the same type of theoretical imposition for which he admonishes his foes?

Regardless, Law and Disagreement is a thoughtful, powerful book that promises to contribute to the tension between trust and distrust in the larger marketplace of ideas. Defenders of judicial review (let alone judicial activism) have met a worthy adversary they may not ignore.

Constitutional Construction: Divided Powers and Constitutional Meaning. By Keith E. Whittington. Cambridge, MA: Harvard University Press, 1999. 295p. \$49.50.

Ronald Kahn, Oberlin College

This is a superb, pathbreaking book that demonstrates the dual nature of constitutional change. Through a subtle analysis of congressional-presidential politics, Whittington convincingly argues that the process by which constitutional meaning is defined is not solely the purview of the Supreme Court and lesser courts. He shows that the Constitution gains meaning as a result of the politics of construction engaged in by political actors seeking political and policy objectives. For most legal scholars the Constitution is viewed as a binding set of rules that can be externally enforced by courts against government actors through the process of constitutional interpretation. Whittington brings to light a "second" nature, "the Constitution that penetrates politics itself, shaping it from the inside and altering the outcomes" (p. 1). This is the Constitution that guides and constrains political actors in the process of policymaking as opposed to constitutional interpretation. In the process of "construction," the Constitution is viewed as dependent on political actors, who formulate authoritative constitutional requirements and enforce fundamental settlements.

To demonstrate the process of construction and compare it to constitutional interpretation, Whittington offers four detailed and well-researched case studies. The first examines the debates surrounding the impeachment of Justice Samuel Chase in 1804–5. This chapter shows how the politics of construction "reshaped our dominant conceptions of the appropriate use of the judicial power in American politics" (p. 17). Whittington cogently argues that this constitutional construction "allowed the removal of judges for more than narrowly criminal conduct, but not for simple political expediency" (p. 65). It was an "essentially political standard, but protected federal officers from removal by impeachment for mere technical errors in the conduct of their office, for private political sentiments, or simply for the purpose of creating vacancies" (p. 65).

The second case involves the nullification crisis of 1832-33,

in which conflict about three different versions of federalism erupted over the continuation of the protective tariff of 1816. "The crisis features the states as significant actors... setting the boundaries of government power as well as dealing with the distribution of institutional functions.... The crisis highlights the interaction of policy interests and constitutional principle in constructions, and the use of statutory instruments to consolidate the new understandings" (p. 17).

The third case study is the impeachment of President Andrew Johnson in 1868, sparked by his refusal to honor congressional commitments after the Civil War. "The episode highlights the unintended consequences of constructive activity and the compromised nature of possible outcomes. In this instance, Congress reaffirmed earlier understandings of the impeachment power, crushed Johnson's efforts to strengthen the postbellum presidency, and put the spoils system on the defensive" (p. 18). As in the other cases, Whittington argues that "many of the [political] principles advocated bore only a tenuous connection to the constitutional text, and textual authority was distinctly secondary in advancing and defending those principles" (p. 156).

The final case explores conflicts between President Richard Nixon and a Democratic Congress in the mid-1970s over the construction of presidential and congressional leadership in terms of budgeting, war powers, and intelligence. Whittington argues that the accepted constructions of the day discouraged the emergence of a general challenge to the modern presidency. "Though Nixon and Ford were unable to sustain an expansion of presidential power or to prevent an undercutting of their inherited powers, they did contribute to the ultimate shape of the constructions that were established. . . . Congress was able to establish new understandings of its responsibilities in budgeting, the conduct of foreign policy, and intelligence gathering, as well as to establish the institutional supports to realize those responsibilities" (p. 206).

Whittington argues that the case studies demonstrate the following: (1) Nonjudicial actors engage in constitutional deliberation; (2) the role of the Supreme Court is situated within a context of competing claims to constitutional authority; (3) political actors elaborate constitutional meanings in ways that are inconsistent with standard jurisprudential meanings; (4) political actors emphasize external political principles, policy concerns, and political interests, while "the text" is used as "cover" to influence the construction process; (5) political will and partisanship, not judicial doctrine or objectivity, sustain construction-building; (6) defenders of constructions that seek to perpetuate the status quo argue that their constructions are legally required by the Constitution, whereas those who advocate change stress the contin-

gent nature of constitutional provisions; both sides seek to "identify themselves with the true and required meaning of the Constitution" (p. 213); (7) since political constructions matter to constitutional outcomes, they should not be "excluded from constitutional theory and relegated to mere political science" (p. 213).

This book deals mainly with how constitutional meaning is influenced by politics. To read only this analysis would lead one to overemphasize the role of politics compared to court interpretation on the meaning of the Constitution and the powers of its institutions. A fuller account would explore the conditions under which the politics of construction, as compared to judicial decision making, defines the powers of the presidency and Congress. Under what conditions does the politics of construction, directed by political actors acting instrumentally, influence constitutional meaning? Under what conditions does the legal model, in which Supreme Court justices do not primarily or only act instrumentally, inform the changing meaning of the Constitution, in this case the power of Congress and the presidency? Unless we begin to ask whether the politics of construction is a pattern played out in all areas of constitutional meaning, we may draw false conclusions about the role of political constructions compared to judicial interpretation of the Constitution.

For example, while many scholars argue that politics, not Supreme Court action in Brown v. Board of Education (1954) rid our nation of invidious race classifications, it is important to note that significant social change in this area only began to occur after the Court forced a restructuring of the debate about segregation and racial equality by its actions. In an effort to show how political constructions are used by political actors to secure policy gains, Whittington fails to analyze how Court interpretation influences the overall construction of political debate itself, thereby closing certain avenues of change and opening others to political actors. Perhaps a more balanced presentation of the process through which institutional power is determined would view the politics of construction and the Constitution as binding rules in a more synergistic relationship, with Supreme Court and lesser court decisions and the politics of construction influencing each other, in varying degrees in different doctrinal areas, especially those involving individual rights. Like all paradigmatic, pathbreaking scholarship, this book raises important theoretical issues and subjects for future empirical study. It is must reading for a wide range of scholars of American institutions and political development, law and courts, history, and American political thought, especially those with an interest in historical institutionalism.

American Politics

Neighborhoods, Family, and Political Behavior in Urban America. By Yvette M. Alex-Assensoh. New York: Garland, 1998. 197p. \$50.00.

Kent E. Portney, Tufts University

Over the last decade or so, scholars of political behavior have increasingly turned their attention to the role of "contexts"—characteristics of local areas where people live—to help explain and understand political phenomena previously examined only at national or cross-national levels. At the same time, scholars of urban politics have become particularly

attentive to the role of urban contexts in determining a wide array of problems typically associated with urban areas and inner cities—persistent and concentrated poverty and the emergence of an urban underclass prominent among them. Yvette Alex-Assensoh has written a fine little book that deserves to be viewed as an important contribution to these literatures. I will try to explain why.

The book initially addresses the literature and debates on the causes of concentrated poverty in inner cities, but its primary purpose is to examine "the political consequences of today's urban context, including concentrated poverty neighborhoods and single-parent household structures, on the political behavior of white and black inner-city residents" (p. 4). Alex-Assensoh approaches this issue by contrasting three competing models that purport to explain urban political behavior. After reviewing the standard socioeconomic status model of political participation, rational choice approaches, and various contextual theories, she argues that existing models either ignore contexts altogether or inadequately explore them. Her central thesis is that neighborhood social context, by which she specifically means living in neighborhoods with concentrated poverty, living in predominantly African American neighborhoods, and living in families with single parents, are important determinants, even more important than race, of social and political isolation, electoral and nonelectoral political participation, and "negative political orientations."

Alex-Assensoh examines this thesis by developing a quasiexperimental design in which she selected four neighborhoods in Columbus, Ohio, for in-depth analysis. They were chosen in order to vary the concentration of poverty and racial composition: one was predominantly black (91%) with concentrated poverty (49% of the residents living below the poverty line); another was predominantly black (90%) with less poverty (21%); a third was predominantly nonblack (16% black) with high poverty (49%); and the fourth was predominantly nonblack (4% black) with low poverty (20%). Thus, the racial and poverty context is operationalized as residence in one of these four neighborhoods. She then conducted telephone interviews with samples of between 201 and 432 residents randomly selected from each area. Clearly, the comparison of the selected neighborhoods facilitated the effort to isolate the influences of concentrated poverty and racial composition from each other and from other variables also thought to influence urban political behavior.

Initial analyses focus on bivariate relationships between neighborhood context and a variety of political and social attitudes and behaviors. Subsequent analyses center on evaluating multivariate path models that attempt to sort out the direct and indirect influences of a number of variables. Many of the findings are contrary to much contemporary wisdom and will not be uncontroversial. Alex-Assensoh found, for example, that in the two neighborhoods with a high concentration of poverty, blacks are not more likely than whites to exhibit aberrant social behaviors, and whites are more likely than blacks to exhibit social isolation. She also found that political participation of residents in high-poverty areas is relatively low, but there is a clear tendency for whites and blacks in these neighborhoods to engage in different kinds of activities: Whites contact political officials more frequently than do blacks; blacks are more likely to attend in-person functions, such as community meetings, to try to address and resolve local problems. Family context—whether living in a one- or two-parent household-certainly influences economic marginalization as well as a propensity to vote in elections, but it tends not to influence overall political attitudes or orientation toward politics.

Sorting out the influences of specific "contexts" turns out to be complex. Living in an area of concentrated poverty, or in a predominantly black neighborhood, or in a single-parent family does not produce consistently negative political consequences. It is clear, however, that the context variables often play significant roles in influencing political attitudes and behavior. According to Alex-Assensoh, "context matters," even if it seems to matter differently for whites and blacks.

The would-be skeptic can find fault with some issues. Foremost among these is a general lack of precision when describing the research results. To her credit, the author tries to tackle the formidable challenge of distinguishing neigh-

borhood poverty status and racial composition from personal poverty status and race. Yet, it is often difficult (or impossible) to know whether Alex-Assensoh is describing people who live in poor neighborhoods, or all poor people, or poor people who live in poor neighborhoods. Similarly, it is difficult to know whether she is describing black people, or all people who live in predominantly black neighborhoods, or black people who live in predominantly black neighborhoods. This underscores the apparent lack of a thorough editorial review.

A second problem is more substantive, owing to the fact that there is no discussion of what the concept of "context" means. The reader is left to wonder why the author would treat a household characteristic—family structure—as a context, somehow comparable to the conception of context as a neighborhood characteristic. If family structure is a context, then so should be family poverty status or many other household traits. In short, the family structure portion does not seem to fit in conceptually. Furthermore, in the analysis of family structure, the descriptive language often refers to people "in single-parent family structures" with no discussion of who they are. One assumes that the person is the single parent (perhaps a female), but there are other possibilities, and we should not have to guess.

Nevertheless, from both a substantive and a methodological point of view, this book deserves to take its place among the evolving literature on the political consequences of urban contexts.

The Puzzle of Judicial Behavior. By Lawrence Baum. Ann Arbor: University of Michigan Press, 1998. 215p. \$42.50 cloth, \$18.95 paper.

Sandra L. Wood, University of North Texas

Lawrence Baum provides a much-needed reflection on the state of the discipline. This book surveys the scope of our current information about how judges go about the task of making decisions and determines that, frankly, we do not know much, and what we do know may be subject to criticism and future correction.

Baum uses the framework of goals as a means to explain judicial behavior for two reasons. First, a goal-based framework "encompasses rather well the major issues in the scholarship of judicial behavior" because scholars of courts are often trying to explain "what justice seeks to explain and how they go about trying to achieve it" (p. 11). Second, such a framework "requires systematic consideration of what people are trying to accomplish and directs attention to the processes that determine their goal orientations" (p. 11). Baum's focus on goals serves him well. It allows him to provide insight into the major theoretical argument in the judicial subfield: the relative influence of law, attitudes, and strategy.

Three chapters explore the nature of goals in three ways. First, Baum considers the extent to which "judges act on the basis of goals related to the content of legal policy rather than the array of other possible goals" (p. 21). He suggests a pyramid metaphor, as judges on lower courts are often depicted by scholars as holding and acting on a wide range of goals (policy concerns, reelection, public opinion, promotion to higher office), whereas those at higher levels are usually depicted as concerned primarily with legal policy. The emphasis on goals highlights differences among judges at various levels and the diverse goals they may hold.

Second, Baum considers the mix of legal and policy goals of judges. He takes seriously the notion that legal concepts

may matter to justices and provides a nicely balanced discussion of the probable balance between legal and policy goals. Particularly helpful in this chapter is the discussion of the difference in goals between those on various courts. Assumptions about the Supreme Court, the focus of most judicial research, may not hold true for the myriad other courts.

Third, Baum looks at strategic versus nonstrategic behavior as a means of achieving goals. His ability to show the nature of competing goals may indicate why strategic voting does not dominate court behavior. Baum's treatment of the balance between sincere and strategic voting (pp. 94–5) is particularly well illuminated by his consideration of goals, in particular goals beyond seeking right policy. Strategic voting may be an attractive alternative, especially in intracourt negotiations, but it may be that other goals, such as the approval of certain groups or the inner satisfaction of voting honestly, may push a justice toward sincere voting.

One weakness of the book is that, although it attempts to examine the state of the field and to get various segments to talk and interact with one another more fully, it fails to provide the tools to do so. Baum discusses each area of law with the familiarity and skill of an expert. Indeed, he provides helpful insights for those who have expertise in the area. Yet, Baum's greatest flaw is not providing enough information on the many areas discussed. Since most political scientists tend to be specialists, even within the judicial subfield, it may be that his objective (as I see it) is subverted by these rather superficial descriptions. Baum tries to point out links, common ground, and similarities among various parts of the field and speculates about future links that should be forged. But his book does not provide enough grist for the mill. He summarizes each study very briefly (if at all, and merely refers to some). This is adequate if one has great familiarity with the literature, but most of us do not know all the works cited extremely well and may know little about the empirical work in some areas. Baum does not provide the basics needed to make the connections. For example, in order for scholars of the lower courts and the Supreme Court to forge links, there has to be more crossover between them, but Baum does not give enough information to help make those connections.

Overall, Baum strikes his own balance between his goal of sharing what we know about judicial behavior and what he thinks we need to learn. Although he tends to focus on future research needs at the expense of explaining the current state of knowledge, he provides judicial scholars with a goal of their own: Develop our scholarship more broadly so that we may attempt to unravel the puzzle of judicial behavior.

The New Liberalism: The Rising Power of Citizen Groups. By Jeffrey M. Berry. Washington, DC: Brookings, 1999. 192p. \$24.95.

Kay Lehman Schlozman, Boston College

Sometime during the late years of the Reagan administration a colleague in the discipline remarked: "I have been teaching about political alienation for many years. Now I know what it is to be truly politically aliented." Early in 1995, when Newt Gingrich was behaving as if he had just become president, if not king, I wondered to myself: "If she was alienated then, how must she feel these days?" I can now get in touch with her and say: "If you are still alienated, read Jeff Berry's excellent new book. It actually has some good news for liberals about politics in Washington."

Berry documents the increase in the number and activity of citizen groups in the last generation and demonstrates that—thanks to seed money from foundations, ongoing support

from upper-middle-class members, and extensive and favorable coverage in the media—they command substantial political resources. These groups are, by and large, liberal: Of the five core values represented by citizen groups—equality and rights, environmentalism, consumer protection, good government, and family values—only the last is associated with conservatives in contemporary national politics. The presence of these citizen groups on the national political scene has resulted in a transformation of the domestic policy agenda in Congress such that the material issues dominant in the early 1960s have receded in importance relative to postmaterial issues. That is, issues such as disability rights, school prayer, and toxic waste disposal that have some noneconomic dimension now occupy much greater space on the congressional policy agenda than do old-fashioned economic issues, such as cotton price supports, job training, or trucking regulation. Not only have citizen groups become the principal antagonists to the business organizations that have traditionally figured so prominently in pressure politics, but also they often win in legislative policy conflicts.

An especially interesting subtheme of Berry's analysis is the ways in which conservative and liberal citizen groups differ. Conservative groups are fewer in number and more visible as individual groups; their leaders are more readily identifiable as public figures. They have put more eggs in the basket of mobilizing a clientele that is not particularly affluent—generating huge sums that are, sometimes, devoted to more fundraising. They have dedicated considerable resources to raising and disbursing campaign funds and have put less energy toward traditional lobbying strategies. Consequently, they have been less successful than citizens groups on the Left, especially environmental groups, in shaping legislative outcomes.

This is a very important book both substantively and methodologically. With respect to substance, Berry adds a significant element to our understanding of the meaning of changes in American politics over the past three decades. In light of such trends as the electoral successes of an increasingly conservative Republican Party, the emergence of the Christian Right, and the domination of the judiciary by Reagan and Bush appointees, the era has appropriately been characterized as one in which conservatives have rewritten the terms of political debate in America and have scored massive policy victories. What Berry makes clear is that this characterization simply does not do justice to the reality of policymaking in Congress. Nevertheless, the configuration of the "new liberalism" includes two developments that receive less attention in Berry's argument: the erosion of the white working-class base of the Democratic Party and the attenuation of union membership and power. The net result has been the eclipse of concern with the economic needs of those less well off. In short, within the story he tells are sobering lessons for liberals.

With respect to methods, Berry comes very close to unraveling the principal conundrum confronted by those who seek to do systematic work on interest groups: specifying a universe of political conflicts from which to sample in order to assess whether organized interests make any difference. In a prodigious data collection effort, Berry gathered and coded information on all 205 domestic policy issues about which Congress held hearings in any of three separate years—1963, 1979, and 1991. Moreover, he also monitored media coverage of those issues—listening to television news broadcasts and reading op-ed pieces in major newspapers in 295 days of 1995. Thus, although he sampled years, Berry examines the universe of legislative issues within those years.

My only quibble with this first-rate book is that what is on

the pages claims too little and what is on the cover claims too much. Berry is so modest in his prose that he does not trumpet sufficiently loudly the novelty or the magnitude of the data or the importance of his findings in revising what we think we know about American politics. I would urge linguistic inflation in the prose and would suggest deflating the subtitle to: "Congress and the Power of Citizens Groups." As Berry knows, and elaborates at length in his nuanced conclusion, he would have told a different story had he focused not on Congress but on any of several other arenas of American politics—for example, state and local politics or the judiciary—where conservatives have scored greater successes. In short, I urge students of American politics, whether or not they feel alienated, to place this book on their "must read" shelf.

The Unions and the Democrats: An Enduring Alliance. By Taylor E. Dark. Ithaca, NY: ILR Press/Cornell University Press, 1999. 233p. \$37.50.

Stephen Amberg, The University of Texas at San Antonio

The coalition between unions and the Democratic Party is stronger than ever, according to Taylor Dark. Pronouncements made over the last twenty years that the New Deal has ended are seriously mistaken. Democrats in Congress and the White House work cooperatively daily with leaders of organized labor. The right-wing reconstruction of American politics since Reagan has been unable to dislodge entirely the power of the AFL-CIO in economic policymaking and its influence in electoral politics. Dark makes these surprising claims in a valuably argumentative and well-written analysis that combines rational choice and historical institutional approaches. He focuses on the bargaining relationships between the leaders of organized labor and the Democratic Party from the 1960s to the 1990s within the context of the institutional structures of American unionism and the larger political regime. As with all such exercises, critics can challenge the parameters for bargaining as well as the characterization of the substance of the relationship. What will withstand such challenges and what is enduring is the ongoing and growing exchange of resources between the leadership cadre of both organizations.

Dark connects his analysis to large parts of the American and comparative literatures on labor to make an original contribution to our understanding of contemporary politics. The relationship between organized labor and the Democratic Party has long been problematic for political scientists conceptually and practically. The peculiarities of American unionism are at the heart of debates about American exceptionalism, the New Deal, the welfare state, interest group liberalism, and the transformations of the party system since the 1960s.

Dark conceives unions as interest groups of an especially potent type, namely, those with the ability to shut down significant parts of the economy, and his study focuses on how the leaders of the AFL-CIO plus the dozen most active federation member unions have adapted to changes in the political, economic, and ideological environment in the last 35 years. Dark also roots his analysis in comparative debates about the governing of capitalist societies, among the most notable projects of which was John Goldthorpe's Order and Conflict in Contemporary Capitalism (1984), which recently has been reassessed by Herbert Kitschelt et al. in Continuity and Change in Contemporary Capitalism (1999). Although Dark does not make a comparative analysis, his stress on

institutional structure and party alignments parallels one line of development in that literature.

Major variables in the 1980s debate that recur in *The Unions and the Democrats* are the importance of centralization or fragmentation of bargaining capacity, the significance of nationally specific political institutions, and the shifting character of policy problems, from growth to inflation, after the 1960s. Many countries employed corporatist techniques with some success, one outcome of which was growing union membership. On each variable, the American value predicted failure to employ corporatism and weak unions. What Dark points out, however, is that these are properly matters of degree rather than binary alternatives: American unions lost much of their position in private industry, but organization increased in the public sector, and the political role of organized labor in the 1990s is virtually unchanged from 50 years ago.

The heart of Dark's explanation is the claim that union leaders and elected officeholders are rational actors who seek to maintain their leadership position, in part by exchanging valuable resources with one another to protect themselves from opponents. He draws on rational choice analyses of bargaining regimes, elections, and the legislative process to elaborate alternative models of union-party relationships, which he calls "centralized pluralism" and "fragmented pluralism." The ability to establish and sustain exchange depends on the degree of centralization in the AFL-CIO Executive Council and the party unity of the Democrats in Washington. Both the labor federation and the federal government exhibit famous constraints on centralization and unity. Nonetheless, leadership strategies can mitigate the fragmenting qualities of institutions, in part by the leaders of the respective organizations helping each other with their internal problems. In the mid-1960s—Dark's starting point-George Meany and Lyndon Johnson were able to assert substantial control over their respective organizations in order to carry on high-level negotiations over a wide range of subjects. This centralization helped provoke a "crisis of representation" in the union federation and in the Democratic Party in the late 1960s and 1970s as insurgents challenged the leaders. The crisis resulted in the fragmentation of bargaining capacity, growing distrust, and a breakdown of exchange relationships. Yet, Dark marshals evidence to support his claim that in the 1980s much of the bargaining capacity was rebuilt by Lane Kirkland and Jim Wright when the latter became Speaker of the House in 1987 and has continued with their successors. The book is substantially devoted to presenting fascinating case studies of union-Democratic leadership relationships and of legislative cooperation and conflict involving organized labor.

The close attention to bargaining over legislative and bureaucratic policies is achieved at a cost, which may be high or low depending on what is most important to explain. Dark notes early on that the first purpose of unions is to bargain with employers, but he almost completely ignores labormanagement relations. This lacuna allows him to skim the problem of declining union membership (a relative decline after 1955 and an absolute decline from the mid-1970s until 1998) and faltering collective bargaining policy. Treating unions as economic interest groups is not unusual, and the period on which Dark focuses provides ample support for the claim, but there is a reason we also use the locution labor movement, which is not used for employers. Indeed, the inequality of the bargaining position of employees and employers is basic to labor-management relations as well as to the political bargaining on which Dark focuses. When Dark cites "disruptions of economic production" as one of the

"bargaining chips" of unions that politicians seek "to either avoid or obtain" (pp. 36-7), we might ask when a politician has ever wanted economic disruption.

A distinguishing quality of the New Deal was that the Democratic Party promoted collective bargaining and made it and the unions, which were its embodiment, part of its project for governing the economy. In short, the New Deal was about restructuring the employee-employer relationship. That began to change in the 1960s, just when Dark picks up the narrative. It is no longer true that the Democratic Party promotes unionization and collective bargaining as a primary element of governance, although the majority will protect the status quo of union rights. One might reconceive the labor-Democratic alliance by focusing on the "crises of representation" as part of a restructuring motive. That might help make sense of Dark's final speculation about whether the AFL-CIO can go on much longer cementing its exchange relationship with the Democrats when the party will not help it with its first purpose.

Oh, Say, Can You See: The Semiotics of the Military in HawaPl. By Kathy E. Ferguson and Phyllis Turnbull. Minneapolis: University of Minnesota Press, 1999. 270p. \$49.95 cloth, \$19.95 paper.

Beth Bailey, University of New Mexico

On many levels, this is a book about what we see and why we see it. Investigating the way that the military is "hidden in plain sight" in Hawaii, University of Hawaii colleagues Kathy Ferguson and Phyllis Turnbull argue that narratives (often visual) of naturalization and reassurance work to render the extensive military presence in the islands both natural and seemingly inevitable.

This is a theoretically sophisticated and scholarly work of activism, full of metadiscursive claims about the larger purposes of the authors. They mean not only to analyze the "particular expressions of militarization" in Hawaii but also to provide a "more general critique of American narratives of war and the state" (p. xv). Seeking ultimately to undermine the constrictions that militarization places on democratic citizenship, they craft analyses intended to "deconstruct the apparent seamlessness of these militarized spaces and their power/knowledge techniques...so as to contribute to contesting their hegemony and opening greater spaces for resistance and counterrationalities" (p. 178).

Ferguson and Turnbull analyze four sites of representation: the Fort DeRussy Army Museum, Punchbowl National Cemetery, the Arizona Memorial, and the iconic-pedagogical presence of Senator Daniel Inouye. Employing a methodological tool box that ranges from postcolonial and psychoanlaytic feminist theory to Foucault, the authors have crafted intellectually vigorous essays devoted to revealing the narrative strategies employed in and by these sites.

For example, "Remembering and Forgetting at Punchbowl National Cemetery" offers a reading of Punchbowl, visited by five million people each year, as a "site for the production of the stories the state tells you about why young men die in war" (p. 108). In a tour de force, Ferguson and Turnbull progress from descriptions of the land itself, and its prior meaning to native Hawaiians, through nuanced spacial analyses of cemetery layouts; the influence of Hegelian tropes of history, nature; death, and the state; the experiences of Micronesian islanders and the Japanese during World War II; and gendered narrative strategies of "masculine reason, dark feminine otherness, filial loyalty, and maternal sacrifice" (p. 131).

One of the more compelling assertions of this book is that Hawaii continually challenges the militarized order through elements of excess—the excess of its geographical and physical spaces, of the bodies of its people, of its language, of its complex ethnic/racial identities and relationships. In many ways, Ferguson and Turnbull likewise contest the militarized order through forms of excess. They choose an excess composed of provocative and sometimes extravagant claims, of widely assorted theoretical formulations, of narrative strategy that rejects the carefully argued and empirically demonstrated for intriguing and elipitcal essays, rich with discursions and challenging juxtapositions. The authors intend to disrupt our ways of seeing, not only through their analysis but also in the very structures of their work.

Ultimately, however, a closer integration of theoretical and empirical might have allowed the authors to craft a stronger case. This work is very clearly about the semiotics of the military in Hawaii, not its political economy or its role in U.S. foreign policy. Yet, the military is oddly lacking from the landscape that the authors argue it dominates. We get only an aggregate figure for military presence—no acknowledgment of the different branches of service, of the various ways in which different military forces construct their "heavy" presence on the islands. There is no discussion of why the military is in Hawaii, except perhaps to help overthrow the Hawailan monarch in the 1890s. One can question the militarization of both the United States and Hawaii and still pay attention to the logics and material circumstances that have produced the militarization. The "erotics" of "war talk" and "national security discourse," while fascinating, needs to be paired with a more specific history and analysis of the military presence in Hawaii. Ferguson and Turnbull demonstrate an impressive knowledge of and sensitivity to native Hawaiian history and culture, which lends their analyses weight and credibility. That same credibility does not adhere to their discussions of the military, because they demonstrate so little knowledge of-or interest in-its history, culture, and complex roles in the islands.

That positioning pervades the book. As do many other works that employ cultural studies methods, this one looks with what used to be called a relativistic perspective on such practices as human sacrifice ("nothing anonymous or impersonal about it"), intra-Pacific conquest, and the intensely hierarchical structures and practices of precolonial Hawaiian society (including gender hierarchies and exclusions, quoting, in their notes, Lilikala Kame'eleihiwa's claim: "As a Hawaiian woman, I can frankly say that I would not mind if I never ate with a man. I can think of many more interesting things to do with men than to eat with them") (pp. 111, 220). Yet, the attempts of military historians and Park Service employees to create representations in which "the enemy is not routinely demonized [and] 'we' are not uniformly virtuous" (p. 45) is briefly acknowledged but treated with something between skepticism and disdain. Of course, the authors' larger point is a good one: the politics of an exhibit is not in its fairness or accuracy but in "its constitution of the ground on which to decide what counts as fact" (p. 45).

Ultimately, although the authors call for plurality and openness in our public life, they deny the legitimacy of all but a few voices. One strength of this book is its great willingness to see differently and to embrace such visions as Sam Ka'ai's gently disruptive spatial imaginary of the mainland United States as an ocean of land containing "strange islands" such as Houston, but I was frequently disturbed by the total lack of willingness to acknowledge with any modicum of respect the experience of those who might be construed as the victims of militarization or the failures of democratic citizenship. What

about the young men who fought and died on Tarawa or Okinawa? The 19-year-old soldier in Honolulu for R&R, fresh from the jungles of Vietnam? The pimply-faced adolescent recruit and his younger wife, bewildered by the not-especially-welcoming reception they received on Oahu? What about the tourist, the lower-middle-class 60-year-old white woman who worked hard all her life and saved for years for her trip to "Paradise"? All are implicated in the militarization of Hawaii, but all have presences that complicate the semiotic realm. Despite the brilliance of some of their analysis, Ferguson and Turnbull too often reject the understandings that would allow them to do more than preach to the choir.

The American Dream in Black and White: The Clarence Thomas Hearings. By Jane Flax. Ithaca, NY: Cornell University Press, 1998. 170p. \$27.50 cloth, \$15.95 paper.

Shulamit Reinharz, Brandeis University

Jane Flax is a psychoanalytically trained political scientist at Howard University, a white woman in a predominantly black university. This would be of no significance were it not for the fact that this book is about race and gender as they intersect with power. The case she analyzes is the second hearing of Clarence Thomas when he was being considered for the Supreme Court. The first hearing focused on his competence as a judge, the second—unwittingly—on his character.

As everyone knows, Anita Hill, a former employee of Thomas, was contacted during a background check. Material she gave in confidence about being sexually harassed was leaked to the press, and she was called to Washington to testify. This encounter was televised for three days in mid-October, 1991, and mesmerized the nation. The drama consisted of four parties: Hill, Thomas, the senators (all of whom were white males), and the viewing public. At the end of the day, Hill's testimony was not believed or considered important. Her character was impugned, and Thomas became a Supreme Court justice.

All nomination proceedings for the Court are potentially dramatic and politically significant. In this case, however, additional history was made because the term "sexual harassment" entered our vocabulary. Since then, discussion of this problem continues daily. This hearing became such a watershed in gender relations in the workplace that when the Clinton-Lewinsky affair was at its height, there were newspaper references to "before Anita Hill" and "after Anita Hill." As memory fades, the hearings are remembered as much as the Anita Hill hearings as they are the Clarence Thomas hearings, because Hill's stature and credibility were challenged as much, if not more, than were Thomas's. Moreover, the public may have forgotten that the televised soap opera was hearings, not a trial. White women identified with Hill; black men identified with Thomas, as did black women and white men. There was no way, given this dichotomization, that Hill's words would carry the day.

Anita Hill's life was spoiled, to a large extent, by these events. Hill claims that only now, after becoming a visiting professor of Women's Studies at Brandeis University and then a professor in the Heller School of Social Policy, has she found a home where she can once again work objectively on the issues that concern her. When she took a position at the University of Oklahoma Law School, her welcome was uneven, at best, and endangering at times. Her book, Speaking Truth to Power (1997), is an autobiography that includes detailed information about her experience at the hearings. In

public gatherings I have attended, she unabashedly labels Thomas a perjurer.

After so much has been written about the Thomas hearings, is there anything left to say? Jane Flax has shown that there is. Rather than focus on who was telling the truth, Flax discusses the language itself, to see what it tells us about American society more generally. We see the grandstanding of the senators, the twists and spins of Thomas and his supporters, the attempt to ignore race, and the squeamishness in the face of sexuality. Flax argues that the hearings compelled the American public to confront directly our contradictions. We were compelled to recognize that the law refers to an "abstract individual" who does not exist. "The senators were uneasy because they were temporarily forced to recognize their own race/gender position" (p. 7). For Flax, abstract individualism is not a philosophical or political term. It is the manic defense we use to deny the existence of race/gender domination in the United States. As long as we resort to that defense, this domination will remain, she argues.

The book is worthy of assigning in classes (which I did in my course at Brandeis on theories of social psychology), but it is also marred. It is filled with typos, repeated words, and other trivia that should have been caught by the publisher. These errors are unfortunate when a book is used in class, because they lower the standards to which students might strive. That is exactly what my students told me, when they noted how disappointed they were in this sloppiness. In addition, some of the errors occur in quotations of Thomas's speech, which leaves the mistaken impression that he speaks incorrectly. A second problem is the repetitiveness in the book and in Flax's argumentation. I also believe the book would have been more effective and persuasive if the author had included long passages of the transcript. When fragments alone are presented, the context is missing, and the argument hinges on a few words. This may reflect Flax's training as a psychoanalyst, where a very few words can stand for a whole world of experience. Finally, although Flax clearly understands a great deal about American society, history, and politics, her interpretations are psychoanalytic. She claims, for example, that our defenses, rather than vested economic interests, keep domination in place.

Narratives, in Flax's view, play a powerful role in creating social order. For example, it is her contention that "we" cannot incorporate the history of race relations into "our" identity, because to do so would destabilize the foundation of our beliefs. Although I concur that it is important to investigate the psychodynamics of social life, her argument is both tautological and does not account for change. It also does not account for the fact that many people are doing precisely what she claims cannot be done: Many do have a critical view of the country's self-representation and understand that detachment from pervasive myths is also what America is all about. For this reason, there were many people in the United States, although not a majority, who believed then, and still believe, that a different outcome for the hearings would have been just.

Congress and the Presidency: Institutional Politics in a Separated System. By Michael Foley and John E. Owens. Manchester: Manchester University Press, 1996. 432p. \$74.95 cloth, \$24.95 paper.

Steven A. Shull, University of New Orleans

This well-written and informative book by these far-away observers offers useful insights in what I consider to be a valuable undergraduate text. Few other such texts on presi-

dential-congressional relations are available. Congress and the Presidency is much more encompassing (by more than 150 pages) than similar volumes on this topic, and it is quite comprehensive in some coverage, less so in other respects.

Foley and Owens organize their volume by institution, with separate large sections on Congress and then the presidency. This takes up about two-thirds of the book, followed by a more interesting but brief section comparing the two institutions. The authors present much more material on Congress (100 pages more) than on the presidency, even though they consider them coequal institutions. They cite only some of the emerging literature using the tandem institutions approach. Comparing the two throughout the book would have been preferable.

There is relatively little that is new in the first four chapters on Congress, which deal with institutional change, electoral connections, organization, political parties, and decision making. Chapter 2 provides the best treatment yet in a book of this type on institutional development in Congress. Interesting historical material and nice longitudinal figures appear, and the authors conclude the chapter with four eras of institutional change in Congress. As with other early assessments, however, they overplay the lasting effects of the Republican takeover of both chambers in 1995. Chapter 3 provides the standard information on elections, representation, recruitment, and constituent relations. Chapter 4 has even less new information on organization (especially committees and lawmaking), but it does provide useful comparisons of chamber differences. Party, leadership, and decision making are covered competently in chapter 5.

The section on the presidency has three chapters: organization, public presidency, and decision making. In chapter 6, Foley and Owens provide a quite interesting discussion of accumulation of precedents from Washington through Wilson, with a fusion of them all by Franklin Roosevelt, but their treatments for the stabilization of civilian federal employment and growth of budget outlays are simplistic. The former is partly due to contracting out and the latter should at least be presented in constant dollars (p. 198). There are some inaccuracies (e.g., Clinton did not issue an executive order on gays in the military, p. 201). Elections are adequately covered in chapter 7, although there is the rather odd statement that presidential election campaigns "attract a greater volume of voters than they did in the past . . . and they lead to a popular mandate" (p. 227). The remainder of the chapter covers the media, and very little attention is given to interest groups and the voluminous literature on public opinion. Chapter 8 is a very brief discussion of presidential decision making. Congress and the Presidency recognizes broad theoretical issues, such as the Lowi and Barber typologies, but does not cite empirical use of either authors' work in this chapter.

After nearly three hundred pages, we arrive at presidential-congressional relationships. Chapter 9 is on legislating together, but we learn of no scholars other than Peterson who use this approach. An overview of presidential influence on legislative support is provided, but it is weak on explaining this measure and its relation to CQ's legislative success (p. 302). Here appears the first real mention of popular approval, but only citations showing its influence are given, rather than those discounting it as important for the president's legislative relations. The authors incorrectly state that approval ratings cannot distinguish by policy areas, but Gallup makes just the distinction the authors favor (economic and foreign policy, p. 310). Chapter 10 provides a very elegant interpretation of separation of powers, but chapter 11 is a rather disjointed discussion of policymaking controversies. Nevertheless, the authors make the important point that the two actors share power in almost all major functions of governing, from lawmaking to oversight. Chapter 12 is a bit disappointing, but at least Foley and Owens seem to believe that Congress and the presidency are coequals. They too easily see gridlock in presidential-congressional relations, whereas it is actually a much rarer occurrence than they acknowledge.

Congress and the Presidency makes the important point that these two branches of government genuinely share power in the policymaking process. Although this argument is now more common than previously, president-centered and Congress-centered approaches still abound. Sometimes the authors rely too much on textual rather than scholarly sources, and they occasionally make claims without evidence. For example, I doubt that cabinet secretaries "often remind presidents" (p. 203). The authors suggest there is limited presidential control of the bureaucracy, but an abundant scholarly literature argues for considerable top-down control; they should at least acknowledge this alternate view. Also, some of the sources used are quite dated.

The volume provides more tables and figures than any comparable book. Although some are not the latest values (e.g., pp. 206, 246), most graphics in the book are quite good. Because some of the tables and discussion are rather difficult to follow, the volume will be tough sledding for unprepared or marginal undergraduates. Much of the book is descriptive, but portions will prove demanding for all but the best college juniors and seniors. Some tables are unclear or contain errors (e.g., p. 160), and others have no sources provided (e.g., p. 164). The occasional comparisons with the British political system are useful.

For foreign observers, Foley and Owens know these two institutions rather well. They offer insightful commentary on most elements of presidential-congressional relations but leave other aspects largely untouched. The volume tells us nothing about the presidential role in the prefloor stage of Congress or institutional competition for agenda setting. We are given virtually no feel for presidential liaison and how Congress reacts to such efforts. Still, the authors get most of it right; there is a separated system of largely equal power sharing in most elements of presidential-congressional relations. All in all, *Congress and the Presidency* is a worthy source for students of American government, if less so for scholars looking for new information about these two institutions.

Spinning Wheels: The Politics of Urban School Reform. By Frederick M. Hess. Washington, DC: Brookings, 1999. 210p. \$39.95 cloth, \$16.95 paper.

Melissa J. Marschall, University of South Carolina

Frederick Hess seeks both evidence and answers to a troubling puzzle in urban education: the adoption, replacement, and readoption of reforms that continue to have no noticeable effect on the deplorable performance of our nation's urban school systems. He focuses on not only the pace of reform but also the start-and-stop, chaotic nature in which it is pursued. A primary objective in Spinning Wheels is to develop a political-institutional explanation for why urban school reform has frequently disappointed, and why these disappointments have not produced material changes in the practice of reform. Using comparative empirical analysis to document insights from various case studies, Hess finds that political incentives and the very structure of urban schooling—the short tenure and limited administrative capacity of superintendents, the lack of expertise and political experience of school boards, and the unwillingness of any educational stakeholder to engage in supervising the implementation and ongoing evaluation of educational reform programs—create an environment in which difficult and controversial reforms are avoided and the constant pursuit of reform for its own sake dominates.

A truly new and exciting feature of Spinning Wheels is the data. Using a stratified random sample of 57 urban school districts, Hess conducted 325 structured interviews with six "fixed position" respondents (e.g., school administrators, school board members, teachers' union heads) in each site in order to investigate what he terms "Third-Wave" reforms (five specific measures focusing on curriculum and pedagogy) during 1992-95. The cross-sectional design and relatively large sample provide a rare opportunity to go beyond case studies and empirically test hypotheses about how variation in the administrative, political, and contextual arrangements of urban school districts affect the pace, scope, process, and outcomes of specific reform initiatives. Hess should be lauded for this ambitious undertaking; as any researcher in urban education knows, school board members, district administrators, and the others in Hess's sample are not easy to track down and frequently are either too busy or too wary of outsiders to submit to lengthy interviews.

Hess also should be commended for his serious and careful attention to theory building. He skillfully synthesizes the vast literature on educational research and practice and weaves it together with political science theories in such areas as leadership, agenda setting, diffusion of innovation, and policy implementation. Consequently, the political-institutional framework he develops to understand reform in urban education is more generalizable. Those interested in other areas of especially urban public policy will likely find *Spinning Wheels* helpful not only for understanding the reform process but also for designing their own empirical studies of reform.

There is much to like about Spinning Wheels, but a number of shortcomings seriously undermine the author's ability to test the theoretical argument he develops. What I found most disappointing was Hess's underutilization of the data and his tendency to rely on anecdotal evidence rather than empirical findings that would more convincingly (and appropriately) substantiate his argument and conclusions. For example, in chapter 7, which explores the effectiveness of urban school reform, Hess presents a careful literature review highlighting the factors (e.g., time, resources, commitment, and leadership stability) that contribute to policy effectiveness. Rather than operationalize and test the effects of these factors, however, he analyzes the effectiveness of education reform by simply comparing districts with different levels of reform activity. Based on this comparison, he concludes that "the evidence strongly suggests that more active districts implement reform less thoroughly and that their reforms fare relatively poorly" (p. 160). Given that the data include many of the relevant measures, Hess could have rather easily tested some of the hypotheses implicit in his theoretical framework and provided presumably a much stronger case for his political-institutional argument and conclusions.

The vast majority of the empirical analyses are merely descriptive, but Hess does specify and test one set of causal models in chapter 6. Specifically, he seeks to explain four aspects of urban education reform: the number of reforms proposed during 1992–95, the amount of attention each reform attracted, the amount of controversy attending reform in each district, and the community's rating of school performance (all measures were based on responses to survey questions). Again, rather than formally test components of his main theoretical argument (which emphasizes political and institutional factors), Hess models these aspects of

reform as a function of strictly contextual variables (primarily measures of the school district's socioeconomic status, spending per pupil, and public school enrollment). Thus, his findings indicate, for example, that the pace of reform could be altered simply by increasing the rate of high school graduation among the district populace or by reducing the poverty rate. Yet, the argument Hess wants to make (and actually makes) is that the pace of reform is related to the institutional arrangements of urban public schools—the tenure of superintendents, the inexperience of school boards, and so on. In short, there is a disconnection between the theoretical argument and conclusions Hess draws and the nature and results of the analyses he conducts.

Another issue is Hess's conceptualization and subsequent measurement of reform. Although the theoretical framework attempts to explain urban education reform in general, Hess limits his analysis to what seems to me a narrow and less consequential set of reforms ("Third Wave" reforms include day and time measures, curriculum, evaluation, professional development, and site-based management). He justifies his selection of cases by the fact that these reforms "were just gathering steam in the early 1990s" (p. 25). What about such reforms as school choice, vouchers, contracting out, charter schools, and accountability measures? Such "governance" reforms featured prominently in most other analyses of education reform in the 1990s, and a considerable proportion of the districts in Hess's sample had such measures in place or were considering implementing them during the period of his study.

One problem with focusing solely on Hess's particular set of reforms is that they are largely procedural and administrative and are thus less likely either to alter existing institutional arrangements or to cause immediate and dramatic changes in educational outcomes. Consequently, the feeling that the flurry of reform activity has yielded so little change in urban school districts is likely to be enhanced when looking only at these "Third Wave" reforms. Perhaps more problematic is the fact that the set of policy recommendations Hess promotes for "getting unstuck" from the "spinning wheels of reform" includes a number of the very governance reforms that were excluded from analysis.

Empirical social scientists may at times be frustrated with the methodological shortcomings of *Spinning Wheels*, but the book is extremely accessible to practitioners and lay persons who are simply interested in urban education policy. Hess's carefully articulated political-institutional framework makes an important contribution to our understanding of the causes, extent, and consequences of policy churn and provides food for thought with regard to designing further studies of urban education reform.

Perception and Prejudice: Race and Politics in the United States. Edited by Jon Hurwitz and Mark Peffley. New Haven, CT: Yale University Press, 1998. 272p. \$30.00.

Katherine Tate, University of California, Irvine

This collection of articles on the racial views of white Americans is based on a 1991 national telephone survey funded by the National Science Foundation. Directed by Paul Sniderman and Thomas Plazza at the University of California, Berkeley, the project team included the volume's editors, Jon Hurwitz and Mark Peffley, as well as other scholars across several disciplines. This survey stands apart from mainstream political surveys, such as the University of Michigan's National Election Study, because of its unique experimental design, which permits researchers to address ques-

tions that previous scholarship based on standard surveys could not.

The first two chapters, by Peffley and Hurwitz and by Sniderman, Piazza, and Harvey, describe somewhat redundantly the context of the project and the questions addressed. The contributors enter into the quite contentious debate over the continuing significance or growing insignificance of prejudice and racial hostility in the policy attitudes of whites. Two camps exist. In rather simplified terms, one side claims that whites remain racially hostile to blacks, an attitude that drives their opposition to policies that might benefit blacks. The other side argues that racism has declined and that white opposition to such policies is based on other beliefs, including a principled objection to big government. Because many of the authors are relatively new to the race controversy, they have no longstanding position to defend in the debate, so they are free to take a fresh look at the issues.

James H. Kuklinski and Michael D. Cobb begin their research on the racial attitudes of white southerners with a clean slate. Rather than replicate and analyze the standard but still contested measures of racial prejudice, they set up an experiment to determine to what degree black behavior can make white southerners angry, specifically, black families moving into the neighborhood and interracial dating between black and white teenagers. They juxtapose the reported anger in response to these acts to the anger professed by the white southern respondents to higher taxes, million-dollar salaries for professional athletes, and environmental pollution by large corporations. An open-ended question format provides an indirect measure of racial anger that yields interesting results. For example, when asked indirectly about black families moving in, a significantly higher proportion of white southerners expressed anger-42% in 1991, compared to 7% when asked directly. Although Kuklinski and Cobb have reasons to doubt the reliability of their indirect measure of racial prejudice, they have created a new technique that may help circumvent the social desirability bias inherent in racial opinion surveys.

Kathleen Knight's piece is the least technically sophisticated contribution, with no complicated experimental design, but it is quite innovative. Knight asked respondents to perform a deceptively simple exercise: In your own words explain why racial inequality exists in the United States. Analyzing responses to this open-ended question, she found that no whites claimed the genetic inferiority of blacks, but about 20% said inequality was rooted in the individual dispositions of blacks. According to this group, blacks simply do not try hard enough to succeed. Half the respondents, however, gave responses that linked inequality to external factors, including segregation and racial bigotry. Another 20% gave answers that included both internal and external forces.

The remaining contributions address aspects of the race controversy that have been examined previously, albeit with new data and a higher level of methodological sophistication. Peffley and Hurwitz return to the question of the degree to which whites negatively stereotype blacks and how such stereotypes influence their attitudes about public welfare. Edward G. Carmines and Geoffrey C. Layman follow through on the earlier work of Sniderman and Piazza in establishing that racial prejudice among Democrats has a greater effect on their policy views than does the racial prejudice expressed by Republicans. Laura Stoker carefully establishes that how affirmative action programs are described can powerfully affect the degree to which whites will oppose them. Martin Gilens shows what others have alleged: White attitudes toward welfare policy and policies for the

poor are highly racially charged. Support for antipoverty programs in the United States depends on white attitudes toward blacks generally.

How important, then, is race to American politics? While the editors reject the new racism thesis, *Perception and Prejudice* strengthens the claims of those who argue that race is strongly implicated in the political attitudes of whites today. As the Peffley and Hurwitz chapter makes clear, about one-third of whites agree with statements that blacks are lazy and are not determined to succeed. A majority also believe that blacks are aggressive and lack discipline. For the researchers involved in the Berkeley race surveys, it is not simply a question of whether race matters, but when, why, and how it matters. The way in which white attitudes about blacks are processed and enter into their politics, however, is quite complicated.

The Tourist City. Edited by Dennis R. Judd and Susan S. Fainstein. New Haven, CT: Yale University Press, 1999. 340p. \$40.00 cloth, \$17.95 paper.

Michael A. Pagano, Miami University

Diversity is one hallmark of a federal system. Conventional wisdom suggests that state and local governments in federal polities experiment with a variety of policies and services, serve the diverse needs of their citizens, and create places of work and play that presumably reflect this diversity. Or is conventional wisdom on diversity reflected and strengthened in the world's growth industry, tourism? The Tourist City provides a theoretical perspective and an abundant evidential base that tourist cities, rather than reflect the uniqueness of place in time or history, replicate one another. Through what the editors and some of the contributors refer to as the "commodification of tourism," cities attempt to attract visitors by increasingly creating "sameness" or a "Fordism" of the tourist industry. This commodification is not new, but the articles illustrate how businesses have found successful formulas for promoting a place's historical or cultural identity and replicate the success in other places that do not have such an identity. It no longer is the case that one needs to travel (or "virtually" travel) to places of historical, architectural, or natural significance, because those experiences can be re-created nearby. Investors and multinational corporations seek to provide consumers the products that match not their unique individual needs but their similar, common needs.

Las Vegas, as Robert Parker shows, now is home to 42nd Street, the pyramids, or the French Quarter to the tourist-consumer. Why travel to those places when the "real" experience can be had in a single location? Likewise, festival marketplaces all tend to look alike, cater to the same clientele, and offer similar products. Norfolk or Boston, it seems not to matter much where one goes, because the experience is the same. Fordism, according to Judd's perceptive analysis in an excellent chapter, means that cities promote "tourist bubbles," or islands within a city that are segregated from the rest of the community, and they tend to resemble one another.

Most of the essays are case studies. Richard Foglesong discusses the evolution of Orlando as a tourist mecca, and Arie Shachar and Noam Shoval examine the allure of religious sites as destinations (Jerusalem). Daniel Hiernaux-Nicolas explores the history of the tourist development of Cancun, and Lily Hoffman and Jiri Musil examine the postcommunist tourist explosion of Prague. The principal theme of the studies is "tourism" more than "cities." Indeed,

several chapters offer theoretical insights into the tourism industry and government promotion of tourism, such as Charles Euchner's study on sports and the chapter by Sabina Deitrick, Robert A. Beauregard, and Chery Zarlenga Kerchis on riverboat gambling.

Anyone who has traveled to any theme park or visited any city's tourist bubble can hardly deny the sameness of the experiences (e.g., one can experience a rain forest without ever leaving the desert). The sameness may create consternation among those who want the real thing and who value diversity. Despite the strong case that tourism has been "commodified" (the study by Saskia Sassen and Frank Roost on the "global" entertainment industry is fascinating in that regard), the reader is not told why the consumer would want to pay for it. Keeping construction (and franchise) costs low by mass-producing sameness certainly explains the allure of tourist sites for investors, but why should hundreds of thousands of consumers choose to travel hundreds of miles to have the same experience that they could have had by traveling a thousand miles? Do tourists value the diversity of culture, history, and entertainment, or is it the universal experience that they seek? A study of tourist tastes and consumption patterns would be an important complement to this book.

Scholars will find several of the chapters important in understanding the direction and vision that cities have adopted in the past few decades, not only in promoting tourism, but also, and more important, in accommodating Fordism. The underlying theme of the book is that diversity is threatened, even in federal systems, which value diversity. The commodification of the tourist industry, so well documented in *The Tourist City*, may be only symptomatic of larger concerns about community values, localism, and diversity.

Pivotal Politics: A Theory of U.S. Lawmaking. By Keith Krehbiel. Chicago and London: University of Chicago Press, 1998. 258p. \$50.00 cloth, \$17.00 paper.

Eric Schickler, University of California, Berkeley

The conventional wisdom that divided government causes policy gridlock has proven difficult to dislodge. Nonetheless, Keith Krehbiel not only offers a powerful critique of this idea but also provides an alternative explanation for gridlock: the need for supermajority support in order to pass laws in the U.S. system. By combining innovative yet accessible theorizing with rigorous empirical tests, Krehbiel has made a major contribution to the literatures on divided government, legislative-executive relations, and the policy process more generally.

Krehbiel begins with the observation that there is a shortage of good basic theories of U.S. lawmaking that incorporate both presidential and congressional decision making. Existing frameworks fail to account for two basic facts of lawmaking in America: Gridlock is common but not constant, and coalitions are regularly bipartisan and greater than simple majorities. Krehbiel develops a simple formal model that yields predictions consistent with these basic facts and accounts for variations in gridlock level and coalition size.

The model includes a president and n legislators in a unicameral legislature, each with an ideal point along a unidimensional policy space and single-peaked preferences. Earlier formal models of legislatures focused on the median voter as the pivotal decision maker, but Krehbiel incorporates two procedures that temper simple majority decision making: the president's right to veto legislation (which is

subject to a two-thirds override vote by the legislature) and the right of unlimited debate in the Senate (which generally can only be overcome with a three-fifths cloture vote). The pivotal voter in veto override when the president is, for example, to the left of the median voter is the legislator whose ideal point and all ideal points to her right make up exactly or just more than two-thirds of the legislature. The support of this veto pivot then guarantees override. Analogous reasoning is used to identify the filibuster pivot. The model generates a gridlock interval: a set of status quo policies that cannot be defeated, even though the median voter in the legislature (and thus a majority of legislators) favors a new policy. This interval is a function not only of the floor median but also of the president's ideal point, the veto pivot, the filibuster pivot, and the status quo. The size of the gridlock interval changes in predictable ways as these pivots shift with infusions of new members and other exogenous

After laying out this theoretical foundation, Krehbiel conducts a series of empirical tests to assess the pivotal politics model. For example, drawing upon David Mayhew's (Divided We Govern, 1991) coding of important legislative enactments, Krehbiel shows that changes in the size of the gridlock interval have a substantial effect on changes in legislative productivity, whereas changes in regime (from divided to unified party government or vice versa) have little or no effect. In separate chapters, Krehbiel also assesses how well the model explains the size of enacting coalitions in Congress and vote switching in cloture and veto-override situations. In these chapters, competing explanations, such as party government theory, are also assessed and generally found wanting.

After subjecting the model to these tests, Krehbiel shifts gears and uses pivotal politics as a measurement model. Assuming the framework captures an important aspect of lawmaking, Krehbiel then asks what implications follow for measuring such concepts as presidential power and party government. In one of the most innovative chapters, Krehbiel derives a new measure for presidential power based on the president's success in persuading pivotal legislators in veto-override battles. This measure is not without its limitations (which Krehbiel explicitly acknowledges), but it provides presidential scholars with a theoretically defensible quantitative indicator for one of that subfield's core concepts.

More generally, one of the most unusual and welcome aspects of this book is that Krehbiel includes at the conclusion of each chapter, a caveats section which highlights the limitations of the analysis. As one might expect, the tests of the pivotal politics model vary in persuasiveness because of the vagaries of measurement, of deriving predictions from competing theories, and of model estimation with limited cases. But by highlighting rather than hiding from these difficulties, Krehbiel not only makes it easier for the reader to assess the results but also points to likely directions for future work.

As Krehbiel notes, on the theoretical side, extending the model to include uncertainty and dynamic play would likely improve the accuracy of its predictions. In particular, in its pure form the model predicts no filibusters and no vetoes. Krehbiel's empirical chapters show that when such off-the-equilibrium-path behavior occurs, subsequent events are nonetheless consistent with the model's predictions. Yet, incorporating uncertainty and dynamics—along with position-taking concerns—would likely yield additional insights into the lawmaking process. The assumption of a unicameral legislature also should be relaxed in future work: Differences

in House and Senate preferences are a plausible source of policy gridlock and perhaps even supermajority coalition size.

The modeling assumption that many readers will find most troubling is that the lawmaking game is essentially nonpartisan. Krehbiel defends this assumption by citing evidence that parties in government are weak in the United States and by noting that if the assumption is fundamentally flawed, then the predictions of the model should not stand up empirically (pp. 26-8). In addition, by testing the model against party government models, Krehbiel challenges the idea that a focus on parties will necessarily lead to improved explanatory power. In some cases, however, these tests are open to contrary interpretations that are more friendly to party government theory. For example, in the vote switching analysis, Krehbiel finds that presidents are less successful in winning over members in their own party in veto situations when there is unified party government than when there is divided party control. Since majority party leaders are presumably allied with the president when there is unified control, Krehbiel argues that this evidence is contrary to a majority party government model. Yet, it appears from Krehbiel's data that when the president vetoes legislation under unified party government, most of his party's members tend to vote against his position on both initial enactment and the override. In such a circumstance, if majority party leaders are agents of majority party legislators (rather than agents of the president), then presumably they would be working against the president rather than alongside him. As such, the president's weakness in persuading his party members when he vetoes legislation under unified party control might be taken as evidence of an independent, but strong, majority party.

Such differences in interpretation by no means detract from Krehbiel's accomplishments in this landmark book. He has developed a parsimonious model for the lawmaking process, tested its implications against a wealth of data, and obtained results that offer considerable, if not unequivocal, support for the model. The challenge now is to extend the model to include uncertainty, dynamics, and bicameralism and for critics of the nonpartisanship assumption to show that a partisan model can yield predictions of similar precision and empirical validity.

Chalk Lines: The Politics of Work in a Managed University. Edited by Randy Martin. Durham, NC, and London: Duke University Press. 303p. \$17.95 paper.

Robert Weissberg, University of Illinois-Urbana

Even the most insouciant tenured professor living high in the most comfortable Ivory Tower will surely notice tribulations in today's university. Unease is everywhere. Many departments continue to manufacture unneeded Ph.D.'s, while other disciplines cannot attract sufficient students to fill waiting jobs. Campus bureaucracies swell at alarming rates, while the pusillanimous faculty mumbles about paltry salaries and being "managed" as factory workers to enhance some nebulous productivity. Increasingly, instruction depends on badly paid roving academic "gypsies," while a handful of academic superstars, several of whom enthusiastically bite the generous hand that feeds them, receive extraordinary financial remuneration. Every year tuition increases outstrip inflation. There are even reports of "labor actions" by self-styled proletarian graduate students. Meanwhile, university governance is being dominated by "professional administrators" whose singular charm is inoffensiveness and a graciousness toward every incessant demand. No doubt, this list of unease is easily expanded.

Chalk Lines is a collection of essays that seemingly address these and related issues. The subject is timely. Make no mistake, the health of today's campus is not merely faculty lounge small talk. The matter is serious. Legislators may conceivably tire of funding units of dubious intellectual merit or subsidizing assaults on Western civilization. The secondary public education exodus may soon affect higher education—private industry may find it cost effective to train its work force rather than pay inflated salaries to illiterate college graduates. A "counteruniversity" of think tanks and corporate research centers (often labeled "campuses") is rapidly emerging. Talented undergraduates may abandon altogether the life of the mind. Indeed, just as corporate America underwent drastic downsizing during the 1980s, higher education may be next.

Of the twelve Chalk Line essays, eight originally appeared in a special issue of that Temple of Postmodernism, Social Text. Four are original contributions. It is a very mixed bag, and, measured by the insights-per-page standard, those genuinely concerned with university life will be largely disappointed. This is a book directed to the postmodern faithful. Several contributions are little more than strident, almost cliché-like defenses of labor radicalism applied to university settings. Harney and Moten, in "Doing Academic Work," opine that "most professors in the United States are part of the service sector proletariat in this country" (p. 155). Notably absent are any hard-headed economic analyses of fiscal constraints and the daunting conflicting missions of higher education today. Turgid prose often disguises simplistic, polemical arguments. An unashamed sense of entitlement is pervasive. In his opening remarks, Randy Martin asserts: "The attack on students takes many forms: workfare, tuition increases, scholarship cuts, increased class sizes, and, when they dare to challenge these, the stiff arm of the law" (p. 24). For these academic activists, administrative refusal to grant full-time status to adjuncts, provide lavish health care benefits, or hire all the unemployed English Ph.D.s only proves the evils of capitalism. That this fashionable cultural Left ideology is part of the problem, not part of the solution, is never considered.

Another recurring theme is how modern universities shun their obligations to impoverished minorities. Again, this failure can have only one explanation: evil capitalism. Every attempt, whether remedial coursework or tougher admission standards, is somehow twisted into smoking gun evidence of malfeasance. Multimillion-dollar outreach programs are but disingenuous ruses. The underlying common expectation is that a well-paying academic job and/or worthy degree guaranteeing a well-paying career are sacred rights, and one acquires these benefits via political mobilization. Significantly, nothing positive is offered to accomplish these lofty although debatable goals; to paraphrase the Nike slogan, "Universities should just do it!"

These analytical efforts are overwhelmingly permeated by an affection for the postmodern vocabulary (nearly everything is a "text") and a hearty disdain for business. The style is rhetorical not empirical. Achieving this denunciation of business can take some prodigious twisting of logic. For example, Gary Rhodes and Sheila Slaughter observe what appears to be a paradox: the burgeoning of women's studies and cultural studies in the face of conservative ascendancy in the university. How is this oddity explainable? An unseen devious hand is at work, to wit: "To the extent that these programs become disconnected from larger social movements and critiques of the economic order, or to the extent

that they are unintelligible except to the initiated, these spaces may actually serve to reinforce the existing order and draw strength away from other progressive programs and projects" (p. 59). In other words, business destroys by caving in to the cultural Left!

America's technological preeminence and the long lines of those from abroad seeking university entry are given scant attention. If any palpable accomplishment receives passing mention, this is (again) evidence of business evil-doing. Relentlessly, often in sentences that defy decoding, the reader is informed that America suffers untold grievous economic crises, and the universities have become cruel exploitive instruments while minorities and women are purposely shortchanged. If university-supplied technology has made life easier, this, too, is a plot to heighten social hierarchy. Useful bits and pieces of empirical data occasionally pop up, but these are mere decorations. For example, Stanley Aronowitz asserts that in 1996 30% of the world population (one billion people) was either unemployed or underemployed (p. 212) but how this number was ascertained or calculated is a mystery. Truth is merely proclaimed.

Much of this invective is dismissable, but the persevering reader can uncover some items of merit. Currie and Vidovich's essay on the rise of corporate managerialism in the United States and Australia is one such gem, although its underlying explanatory framework cannot rise above the usual postmodern account. Based on interviews in six universities, the authors find that academic decision making has "become more top-down, bureaucratic, centralized, autocratic and managerial" (p. 122). This nefarious intrusion even dictates how knowledge itself is created (although this is never demonstrated). A particularly pernicious trend is transforming lower level administrators into instruments of higher authority—the department chair as lackey foreman. As many of us have long suspected, this bureaucratic shift was accomplished by burgeoning faculty-administrator salary gaps. Anxious powerlessness among faculty is often the upshot of this power shift. The predictable culprit is the infusion of the business ethos into university life, especially at the higher levels. Nevertheless, the authors conclude on a slightly upbeat note by suggesting that if this managerialism can be dislodged, true collegial decision making can still thrive.

It is said that a pickpocket sees only pockets. Similarly, those embracing the postmodern faith see only economic crisis and capitalist evil. This is most unfortunate, for the dilemmas confronting university life are serious, and conscripting the disgruntled into some grand cultural-political assault invites catastrophe. When ostensible tangible advice is given, it is often of a confused sort. Christopher Newfield (p. 71) advises that the solution to the increasingly businessdominated academy's woes is to increase the university's influence on the business culture. But what contingent of scholars should be sent to corporate headquarters? After all, there are untold departments that might seek this invitation, including those in schools of business or disciplines more sympathetic to business than Newfield's fellow postmodern scholars. We deserve better. The craven power-hungry administrator is not a text, and it is a romantic fantasy to mobilize the toiling adjuncts to storm the Winter Palace. Serious analysis is not performed when the usual suspect business—is unceasingly rounded up. Our insouciant Ivory Tower dweller is uneasy for good reason, but, alas, Chalk Lines will not furnish the necessary useful insight.

The Governor as Party Leader: Campaigning and Governing. By Sarah McCally Morehouse. Ann Arbor: University of Michigan Press, 1998. 322p. \$47.50.

Gerald Benjamin, SUNY New Paltz

In the 1960s, upon entering his Florida hotel room with his family to start a vacation in the depths of winter, an upstate New York Republican county leader found waiting a message from a close political aide to Governor. Rockefeller. "Call immediately," it said. He did. "The governor wants you here," he was told. "Your Assemblyman won't support the budget." The leader protested; "I can handle it by phone." The response was: "Not good enough. Get on a plane."

Leaving his family behind, the county leader flew back to New York City and then drove for hours through the snow to Albany. He and the assemblyman had a talk. The leader reported to the governor's aide that all was straightened out, "I'll go back to Florida now," he said. "No you won't," was the reply. "The governor wants you here until all the votes he needs from your man are delivered." So the leader stayed in Albany for four days, until the deal was done. New York passed its budget on time. Only then was the leader released to return to his foreshortened Florida vacation.

That was party government. A single party controlled the governorship and the legislature. The governor commanded a disciplined party. Party leaders got members elected and did not hesitate to call in the chips when necessary. Those were better days, Sara McCally Morehouse would say, for she is an unreconstructed believer in the importance of political parties for democratic governance. "Only cohesive parties," she believes, both seek to "gather the greatest numbers and intensities and interests in order to govern" and have the capacity to "keep their promises, and ... [thus]... be held accountable." Because of this, she says, "political parties are basic to our survival under a humane governmental system" (p. 281).

This volume, designed to confirm the author's belief in the importance of parties in the states through systematic comparative empirical analysis of their role in electing governors and gaining support for them once elected, is the capstone of Morehouse's long and distinguished career as a scholar in the field. It is based primarily on data for the 1982 election in ten states—five in which parties are empowered by law or practice, five in which they are not-and on legislators' votes in 1983 on governors' program bills in each of these states. The strong party states were Colorado, Connecticut, Illinois, Minnesota, and New York; those in which party leaders had little influence were California, Kansas, Arizona, Tennessee, and Texas. Gathering the data was a prodigious task. Quantitative material for 1982, analyzed with regression analysis, was augmented by interviews with gubernatorial aspirants (or their campaign directors). Visits to state nominating conventions in 1994, and a questionnaire administered to convention delegates in that year, allowed some updating and assessment of changes over time.

The author argues, first, that in states which preserve or permit a key role for party organizations in the nominating process for governor—through formal or informal preprimary endorsement of one of the aspirants—that role is likely to be crucial to the outcome of the nominating process. Second, support of the governor's program by his or her legislative copartisans in states in which the nominating process empowers party organizations is greater than in those in which it does not. Morehouse is especially interested in demonstrating that the practices which strengthen state party organizations make big money less important in the gubernatorial nominating process.

Morehouse confirms the overwhelming importance of incumbency, with primaries (where they occur) used to "tune up" the governor's reelection machinery. Absent an incumbent, campaign money is the key factor in gaining the gubernatorial nomination in nonparty endorsing states, but "in the pre-primary endorsing states, party organization dominates money," and endorsed candidates are likely to be nominated (p. 186). Moreover, persistent intraparty factionalism based on ideology, geography, degree of urbanization, and personality is most evident in states with weak party systems.

In the postelection year, legislative support from the governor's party for his or her program is shown to be greater in states in which the nominating structure empowers the party organization. The analysis is complicated, however, by divided party control of state government during 1983 in seven of the ten states. In such circumstances, as the author notes, governors must go across the legislative aisle to have their program adopted, and they risk alienating members of their own party when they do so.

At the individual level of analysis, Morehouse finds little relationship between the governor's electoral strength in a legislator's district and support of the governor's program. Yet, by correlating socioeconomic data with legislative support of the governor's program for a subset of two strongand two weak-party states (Minnesota and Illinois; California and Texas), she determines that "where party cannot explain voting loyalty, district demands can help provide the explanation" (p. 244).

The follow-up in 1994 suggested to Morehouse that money had gained importance in the nominating process for governor over time. Moreover, there was an increased predisposition for other aspirants to challenge party-endorsed candidates for governor, a tendency that was, she states, probably irreversible as state parties brought fewer resources to the table.

But this research may overstate from the first the value of the party endorsement in strong-party states. For New York, to cite one example, Morehouse downplays the importance of money in influencing the Republican nomination for governor in 1982, but it was not only the measurable amount—how much was actually raised by the potential aspirants—that was key. As important was the calculation, less measurable, by Republican leaders (then the out party) of how the campaign might most easily be financed. Fund raising was hard, these political veterans knew; why not let Lew Lehrman pay the tab, as Nelson Rockefeller had done in their salad days?

Also in New York, Morehouse misses that it was a long-established norm in the state's Democratic Party to arrange for each serious candidate to receive one-quarter of the convention votes on one of several ballots, so that a primary could occur without anyone having to petition for a ballot position under state law. That is, party harmony was maintained by leaders at the convention by making it easier for a challenger at the convention to enter the primary against the party's endorsee. And of course, as the author does note, it has been common in New York for Democratic Party endorsees for governor to lose primary fights for the nomination to challengers, as was the case in 1982.

Students of state government know that there is a cyclical rhythm to the legislative process, defined by the fixed terms for governor and members of each house. The toughest business tends to get done in the year in which all the key players are most distant from their next election. In contrast, the process is most contentious and bills are harder to pass in years in which all the players must leave the capital and face

the electorate at the same time. Morehouse does not consider election cycles in her discussions of party strength and legislative support for the governor's program. One hesitates to be critical of such a carefully constructed analysis of data so painstakingly collected, but this is an important limitation to a single-year analysis.

There are instances in which the author reaches beyond her evidence, as when she comments regarding the rarity of primary battles in Vermont: "Ruralism is an inhospitable environment for political conflict" (p. 41). Some generalizations are clearly at odds with recent experience, as when she suggests that "state parties cannot provide the new technology" of political campaigns (p. 182). In general, however, the limitations of this valuable study come down to the issue, well known to researchers, of what may be best learned from careful, large-scale, quantitatively based comparative analysis and what may be best learned from in-depth study of single systems. Even if detailed knowledge of one state causes the lessons of Sarah Morehouse's work to be modified in the particular, they remain most important in general in informing our understand of the essential role, actual and potential, of party organizations in state politics.

Those were better days? I would agree. New York, with divided partisan control, has not had a timely budget in fifteen years.

Sports, Jobs, and Taxes: The Economic Impact of Sports
Teams and Stadiums. Edited by Roger G. Noll and
Andrew Zimbalist. Washington, DC: Brookings, 1997.
508p. \$49.95 cloth, \$22.95 paper.

John T. Williams, Indiana University

The verdict is now clearly in. The resources used by local and state governments to subsidize professional sports teams, usually to help build and renovate stadiums, do not produce much economic benefit to the host communities. This book does much to discredit claims to the contrary. The introductory and closing chapters by Noll and Zimbalist do a fine job of stating the problem and addressing conclusions derived from the findings in the book. In between, chapters analyze specific cases of subsidies (Twin Cities, Baltimore, Cincinnati, Chicago, Cleveland, San Francisco, spring training, and the minors) and the economic effect of sports facilities. In all, I recommend this book to anyone—whether academic, government official, or interested individual—who wants to understand the economic and, to a lesser extent, political foundations of the recent craze in sports subsidies.

The chapters examine the political economy of professional sports leagues and teams. Most focus on the details of particular cases. Why did a city decide to subsidize a team? There are political reasons, but much of the analysis centers on the faulty economic foundations of policy analyses. For example, most politicians in favor of subsidization cite the major reason, or rationalization, as economic development. When a serious policy analyst tackles this issue, it becomes clear that many of the benefits of professional sports teams are consumptive and cannot really be thought about as economic development. The jobs created are simply moved from one entertainment venue to another. The economic benefits are small because people usually do not travel a long distance to watch a game. Even the players often spend much of their income elsewhere. Of course, there are additional economic arguments, such as improving the inner city, but these do not hold up precisely because the public dollar is almost always better spent on true economic development, if not on something else.

Why does this happen? Politicians, if not always the people, want to keep the teams at even very high costs. One theme throughout this book is that someone is cooking the numbers, and it is the governing elites. Just why they do this is open to speculation, but most likely it is because they want to have a major sports team in the city. In countless referenda, public subsidies are voted down, sometimes over and over, as happened in San Francisco for several years in the early 1990s.

Chapter 5 is one of the most interesting for the political scientist. Rodney Fort shows how political officials have the power to offset the possibility that voters may not support a referendum on sports stadium subsidies. By controlling the agenda, political officials, acting almost like professional team shills, often can rig direct democracy in a way that favors professional teams. We cannot blame the public, as voters have not been inclined to support sports subsidies, so agenda control can be a major source of power for those favoring support for professional teams.

Noll and Zimbalist do an excellent job of summing up the empirical evidence and offering policy proposals in the last chapter. The most innovative suggestions look to the federal government for solutions. The most esoteric involves antitrust regulation. Sports leagues, by their very nature, are monopolies. The National Football League was granted a limited exemption so that it could merge with the American Football League in 1966. Major League Baseball had but recently lost this exemption, granted by the courts in 1922 (Federal Baseball Clubs of Baltimore, Inc. v. National League of Professional Baseball Clubs, 259 U.S. 200). Noll and Zimbalist focus on the fact that leagues are monopolists who limit output (teams), thereby increasing the competition among cities for franchises.

I like the policy proposals that Noll and Zimbalist offer. The most important is to force a breakup of leagues, not unlike the way AT&T was dismantled in the early 1980s. What would happen if federal courts mandated that the American and National Leagues in baseball become independent, as was the case in early professional baseball history? There would be competition across leagues and little ability to enforce guidelines about where a franchise could locate. The problem they identify is that sports leagues limit entry and movement (although this has been found to be a violation of antitrust laws), and cities are in no position to resist the urge to subsidize. That is why small cities have been very successful in procuring franchises when large cities, such as Los Angeles, have been without an NFL franchise for a number of years. Noll and Zimbalist suggest that a number of correctives to antitrust judicial interpretations would decrease the amount of competition among cities for franchises. Foremost among these would be restricting the ability of leagues to limit the number of franchises for any league. More leagues mean more teams and less competition among metropolitan areas for procuring these teams.

So far, so good. But why is there continued interest in subsidizing sports teams, especially since majorities in most cities are unclear in their support? I have one suggestion. Only a slim majority, and sometimes a minority, supports these subsidies. But what about the sports fan? Noll and Zimbalist estimate that the typical subsidy is about \$10 million a year. While hefty, this is not that different from the subsidy for the arts in the top ten or twenty metropolitan areas in the United States. Certainly, fewer people use museums than enjoy professional sports. Simply having a team in the area can be seen as a benefit. Even fans who never attend a game derive pleasure from rooting for a local team. These fans will not necessarily be a majority, but they

may have intense preferences. Thus, one argument in favor of subsidization is the pleasure derived by fans from simply having a team. Even if one accepts this point, however, two problems remain. First, measurement of fan satisfaction above and beyond ticket sales would be difficult. Second, without increasing the number of leagues, the subsidies provided by cities and states could easily exceed these public benefits. I believe this is why analysts have stayed away from arguments such as this.

In short, this is a very good book that details the problems associated with subsidizing sports teams. There are many nice case studies. Furthermore, the introduction and conclusion do an excellent job of bringing things together.

The Making of Telecommunications Policy. By Dick W. Olufs III. Boulder, CO: Lynne Rienner, 1999. 213p. \$49.95.

John Havick, Georgia Institute of Technology

Telephone rates increased when the U.S. government assumed control of the telephone industry during World War I. Government was blamed for the higher rates, which ended any thought of nationalizing the telecommunications industry. That industry, however, observed the advantages of limited government regulation, and for about five decades the governance of communications remained stable and regulated. In a rare instance of a substantial new direction, Congress passed the Telecommunications Policy Act of 1996. How it became law and was implemented is the subject of this book.

The 1996 act made numerous revisions in the status quo. One of the most sweeping changes required regional Bell operating companies (RBOCs) to open up their market to competition. In compensation, the RBOCs were permitted to provide long-distance service, but before doing so they had to prove to regulators that there was meaningful competition in their local market. Other aspects of the 1996 act included less regulation of broadcasting and cable. While much of the legislation was designed to increase competition within the telecommunications industry and decrease regulation, the exception was Title V, dubbed the Communications Decency Act, which sought to eliminate pornography on the Internet.

The Making of Telecommunications Policy explains how the 1996 act reached the agenda, passed Congress, and was implemented. To explain the making of the 1996 act, a political model and an analytic model are used. The political model, which is based on Kingdon's Agendas, Alternatives, and Public Policies (1984), examines problem, policy, and political streams. The analytic model is concerned with knowledge-based policymaking and focuses on efforts to forecast outcomes, preferences of different outcomes, and choice priorities. The two models are not competing explanations; rather, they are different perspectives that each offer understanding and distinct explanation. The models serve to organize and guide the analysis in chapters that trace the evolution of telecommunications policy, examine the process that ultimately produced the act, consider the implementation of the legislation, and reach a conclusion.

What prompted Congress to alter significantly the structure of rules controlling telecommunications? This book argues that a confluence of factors supported a policy change. Several insightful pages explain why technology, and particularly digital technologies, played an important role. The philosophy of competition had already been embraced by policymakers, and the fortunes of electoral politics had produced leaders who were interested in new directions for telecommunications. Thus, the problem, policy, and political

streams all converged to favor change. This is not a quantitative analysis, so readers hoping for a regression coefficient or some other indicator that might weigh the importance of the various factors will not find it. There is no definitive weighting of the relevant factors.

The book's rich understanding, information, and insights about telecommunications and the passage of the 1996 act are skillfully integrated into the narrative and extend the explanation well beyond the confines of the models. Sufficient facts are given to understand a range of scenarios and interpretations for the passage of the legislation. For example, technological change had already altered telecommunications, and U.S. industries were feeling the pressures of global competition. To upgrade and expand the nation's telecommunications infrastructure would cost billions of dollars; and in a regulated environment government would be blamed for increased phone, cable, and other rates. In an unregulated environment, the market would be the culprit. Under such circumstances, a philosophic acceptance of competition and deregulation could be viewed as prudent for politicians seeking reelection. The idea of competition provided a convenient and powerful argument for policy change.

What does the analytic model reveal? Olufs finds meager analytic policymaking at work during the passage of the 1996 act. Telecommunications is notorious for substantial special interest influence over policy. The large telephone companies poured money into congressional campaigns and lobbied energetically, activities that are not conducive to rational decision making. It is not surprising that the industry had a say, albeit not a complete say, in the 1996 legislation. As for the general public, fully one-third still believed their local phone company was AT&T, which had not been the case for more than a decade. The public usually ignores telecommunications and certainly in this case, remained silent and uninformed.

The 1996 act has created change, but because priorities and outcomes were not well articulated, what occurred was not always what was anticipated. Local telephone competition has been slow to emerge, and regulators have not permitted RBOCs to enter long-distance markets. Implementation of the act largely fell to the Federal Communications Commission, and Olufs maintains that the FCC controlled the outcomes. "So it appears that the study of policy in this case should not focus so much on legislation as on the rules adopted by the FCC" (p. 186).

About one-sixth of the national economy focuses on telecommunications, so many scholars and analysts should have an interest in the topic. In particular, the book should attract several sets of readers: policy analysts seeking to expand their focus beyond the policy areas more frequently studied, people interested in agenda setting and formulating of policy, students of Congress, and anyone interested in the making of telecommunications policy or the 1996 act. This book falls between an insider account, such as Coll's The Deal of the Century (1986), about the break-up of AT&T, and Temin's The Fall of the Bell System (1987), a densely detailed and referenced account of the break-up. The Olufs book has considerably more analytic power than either of these. It is closer in quality and emphasis to Bicker's chapter in the work edited by Campbell, Hollingsworth, and Lindberg, Governance of the American Economy (1991). The Making of Telecommunications Policy is among the more important contributions since Horwitz's The Irony of Regulatory Reform (1989). Anyone who wants to understand telecommunications policymaking should read this book.

Tales of the State: Narrative in Contemporary U.S. Politics and Public Policy. Edited by Sanford F. Schram and Philip T. Neisser. New York: Rowman & Littlefield, 1997. 270p. \$65.00 cloth, \$22.95 paper.

Anne L. Schneider, Arizona State University

Tales of the State offers interesting examples of the role of stories, or narratives, in politics and public policy. Although some chapters are stronger than others, the collection overall makes important contributions to a more pluralistic approach to policy analysis. The editors justify the approaches represented in their volume on the grounds that "stories are used by elites and masses alike to make sense of events according to a less than factually documented storyline (p. 1). "Stories" are defined as discrete narratives that explain social or political phenomena, such as apartheid or welfare dependency.

The editors attribute to stories a foundational role and contend that stories are "already there" (p. 5). The foundational role is illustrated in two ways, and most political scientists and policy analysts will understand both. First, stories are "already there" in the sense that they are written into the perceptions of individuals, so that the facts surrounding events are selectively understood in light of predominate stories. Second, stories are foundational for behavior when behavior is motivated by an attempt to emulate norms or values that are found in narratives. The role of stories in politics and policymaking is explained as follows:

Political actors use stories as scripts for engaging in political performances, from lobbying to policy formulation, from mass mobilization to posturing by political leadership. And since it is almost always the case that more than one story can be told to make sense of any particular areas of concern or issue, stories are necessarily not innocuous and disinterested but instead are potentially dangerous and interested. They are critically constitutive elements in shaping political practice and public policy" (p. 6).

The editors claim that "the primary goal of policy analysis should not be to distinguish reasoned deliberation from instances of rumor mongering, but to interrogate all policy making activity for its narrativity and assess the consequences given the persuasiveness of particular tales" (p. 6). Despite this apparent nod toward strict constructionists and many postmodernists (that there are no "facts" against which "stories" or "representational practices" can be juxtaposed), the editors reject the notion that all stories are equally legitimate. "Although it might not be possible to get entirely beyond narratives to a purely factual basis of the world, some tales are tall tales, not only in that they do not accord with established facts, but also because such stories constitute a form of denial or a construction of reality that erases alternative knowledges, perhaps covering up what would otherwise be obvious facts" (p. 8).

At times, the reader may be somewhat confused by seemingly contradictory statements that, on the one hand, argue for the primacy of interrogating stories and assessing their consequences (rather than comparing factual with narrative knowledge) but, on the other hand, acknowledge that there often are facts available and it is well worth one's time to interrogate stories against accepted facts. Some of the articles rely mainly on the first approach—examining the consequences of stories without (much) regard for their factual basis—but most use a "contextual constructionism" to examine both the facts underlying various claims as well as the consequences of those claims. Joel Best's article, "The Van-

ishing White Man: Workforce 2000 and Tales of Demographic Transformation," is an excellent example, as he examines in detail the origin of a major common misinterpretation of workforce demographic changes. From the original study, the authors could have concluded, based on the data, that the proportion of white males in the workforce would decline from 48% to 45% by 2000. Instead, the authors wrote that "the small net growth of workers will be dominated by women, blacks, and immigrants. White males ... will comprise only 15 percent of the net additions to the labor force between 1985 and 2000" (quoted by Best, p. 176). Best offers possible explanations and traces the consequences of this particular claim made in the social science study.

Another approach is illustrated in Michael J. Shapiro's chapter, "Winning the West, Unwelcoming the Immigrant: Alternative Stories of 'America.'" He traces hostility toward immigrants back through history, attributing much of it to the notion that a unified, homogeneous, white, national, European "culture" first "conquered" the West against the "savage" Indians and has been constantly threatened by other races and cultures. Against this orthodoxy, Shapiro takes an ethnohistory position and argues that Indians were not merely driven off or defeated but left lasting cultural marks on "America. "Certainly, many of the Native American cultures became to some extent Europeanized, but it also is the case that English colonial culture became in part Indianized, with lasting historical effects" (p. 24). The history of culture, he argues, has been a process of coinvention, not the single achievement of one dominant culture. "Unified and fixed national cultures are fictions, productions of national fantasies" (p. 26).

Other chapters take similar approaches in examining how particular stories rise to ascendancy, how alternative stories are just as likely (given the facts and events), and the consequences of accepting one story rather than another. Carl Swidorski offers a Marxist analysis of constitutional tales; John Kenneth White examines how contemporary U.S. presidents have used storytelling to gain popular legitimacy; Sanford Schram deconstructs the politics of the language found in the Contract with America; Leslie Vaughn analyzes the rhetoric of Clarence Thomas in his confirmation hearings. There are interesting short articles on welfare, gay rights, NAFTA, globalization, black criminality, and many others.

The editors initially posed three goals for the book. First, highlight the role of narrative in politics and policymaking. In this the book succeeds admirably, as its 19 chapters examine stories across a wide array of policy arenas and political events. Second, promote a "more politicized policy analysis." This goal is not clearly explained. The editors could mean that the book will introduce into the adversarial political arena counternarratives to the dominant (elite-inspired) stories and their consequences. Or they could mean (by "politicized") that they hope to democratize policy analysis by illustrating how elite-inspired narratives are deficient either in their factual bases or in crowding out equally likely narratives that would have more democratic consequences. Some of the chapters fall into the first category and become little more than "claims" that have no more legitimacy than the stories they seek to replace. This would be a devastating approach to policy analysis, in my judgment, because it would only encourage the type of degenerative, hyperpluralistic politics that has produced numerous policy failures over the past decade. The second possible meaning of the phrase "politicize" is to democratize policy analysis, but to do so while adhering to common standards of evidence and reasoning. Building on these two, the third goal is to "undermine the validity of the elite/folk distinction" that permits some (elites, experts) to construct tales of the state and discourages

others (common folks) from finding a voice in public policy. The book contributes to this goal, and it is one worthy of more attention from political scientists.

The Congressional Black Caucus: Racial Politics in the U.S. Congress. By Robert Singh. Thousand Oaks, CA: Sage, 1999. 240p. \$54.00 cloth, \$24.95 paper.

Dianne M. Pinderhughes, University of Illinois, Urbana-Champaign

Robert Singh introduces his study with a review of three perspectives on why the caucus has not been successful in advancing its distinctive policy agenda. One possibility is the strategic argument, namely, that there has been a failure of black leadership to develop appropriate political plans to win. A second is the ideological case of black exceptionalism: Because American blacks are distinctively liberal, emphasize liberal governmental programs that require substantial expenditures, and remain so in a polity that has grown increasingly conservative, their preferences are simply outside the mainstream. Singh also explores a third structural explanation: institutional factors such as a majoritarian system, bicameral legislature, separate bodies at the national level, and a variety of other features interact with and exacerbate the group's ideological position at the edges of the political continuum. The volume carefully weighs these three explanations and offers an impressively detailed view of the complexities associated with the efforts of an organization to represent its own constituents and a national black constituency within Congress.

Singh treats the caucus as both a collective black entity and a congressional entity. He explores its growth and development over time in both these dimensions, which means that Singh integrates the perspectives of the caucus members in all their complexity. The study is substantially enhanced by the use of a comparative theoretical framework, in which Singh illuminates the contrasts and consequences of institutional variations in national polities, a majoritarian versus a parliamentary system, and a two-party versus multiparty system. The comparative framework enables the author to distinguish the structural characteristics from the racially specific characteristics of the American institutional system.

The book addresses the caucus's activities as a group, activities as members of or within the caucus, and views on its role by blacks and other congressional actors. Chapters 2-4 examine black congressional representation historically; chapter 2 covers roughly the century after the Civil War, when there was modest if inconsistent congressional representation; the three decades when there were no black representatives; and the period from the Depression through the 1950s, when northern black representation began and grew. Singh considers the caucus's origins in chapter 3 and in chapter 4 examines its growth and development within the context of increasing conservative Republican strength in national political institutions. Chapters 5 and 6 treat the caucus members within their "representational environments...at home" and their "institutional environments... on the hill" (p. v). Chapter 7 reviews the caucus in the 1990s, when it underwent rapid expansion as a consequence of broad use of majority minority districts after the 1990 Census, and when a number of its members achieved considerable seniority. Singh concludes with a reconsideration of the theoretical puzzle he posed at the beginning of the book, that is, why the caucus seems not to have been more effective in representing the policy interests of its constituents.

Singh has created an unusually broad theoretical foundation for the study, reviewing both American and European legislative, institutional, racial/ethnic, and partisan research. The author also devotes several chapters to an historical and highly detailed examination of the growth of African American political participation and congressional representation, as well as to the growth and evolution of the caucus. The book is a highly theoretical discussion of a racially distinct group that also occupies structural space within an American political institution. Singh sustains these dimensions throughout the study with admirable control and clarity.

Singh's exploration of racial and theoretical factors as well as his careful evaluation, comparison, and weighing of strategic, ideological, and institutional forces in their effect on the caucus makes this book such an important contribution to the literature. Singh examines the importance of the caucus as a racial group but also compares its role as a caucus with other legislative service organizations, of which there are many kinds. The black caucus's homogeneous partisanship and strong liberalism, for example, mean it holds "a distinct strategic position compared with most caucuses" (p. 60).

Race is a powerful force in American political life, as Singh's work affirms, but it is not a stable and unchanging factor. The caucus was conceived as a body that would have national responsibilities for representing the black population as a whole, but as it has grown these external orientations have been abandoned for institutionally oriented activities. As the national political environment has become more fiscally conservative, under both Republican and Democratic administrations, the caucus has played a more oppositional role in terms of policymaking. It has been less successful as an interest group, but Singh argues that it was an effective labor union for its membership in the earlier decades of its existence.

Those who expect a highly partisan analysis of the caucus will be disappointed; Singh is not especially critical of recent work, such as Swain's Black Faces, Black Interests (1993) or Thernstrom's Whose Votes Count (1987), which challenged the effectiveness of black elected officials. Rather, Singh offers a distinct alternative to research centered on the racial/ethnic character of the group as problematic; he also does not explain away the faults and weaknesses of the caucus or emphasize its strengths as a racial group. Singh reframes the way in which scholars will examine racial and ethnic organizations by developing the complex institutional context within which such caucuses functions and by illustrating the ways in which groups with similar structural rather than racial or ethnic characteristics, in other national settings, successfully influence policy. The latter do not operate in majoritarian two-party systems, with bicameral legislatures, single-member districts, and other structural features that limit the effect of coherent minority political interests.

Singh concludes: "The institutional consequences of that presence for public policy regarding blacks remain modest. It is difficult to see what more the caucus could have effectively done within the structural confines of the American political system to achieve its goals without either alienating its black constituents or forfeiting its ideological integrity" (p. 198). Singh has written an unusually important analysis of a racially constructed American political body, which operates within the heart of a national political institution.

The Reagan Effect: Economics and Presidential Leadership. By John W. Sloan. Lawrence: University Press of Kansas, 1999. 311p. \$35.00.

Erwin C. Hargrove, Vanderbilt University

This book is aptly titled because, while it is a study of the politics of economic policy, it is also an acute analysis of

Ronald Reagan the politician. Sloan's central thesis is that Reagan was skillful in combining broad thematic appeals for a popular audience with pragmatic flexibility in policymaking. This is the best Reagan portrait that I have seen because it helps close the gap between Reagan's ignorance of policy substance and his political ability. He provided a sense of direction and let subordinates do the heavy lifting, thus protecting himself. This was anything but incompetence. The drawback, of course, is that a price had to be paid for ignorance in the form of chronic budget deficits. But we did experience 92 straight months of economic recovery.

The Reagan problem is that one cannot get into his mind, and he was not forthcoming with his intentions and calculations. Sloan says, correctly, that Reagan was less impressive privately—in the White House—than publicly. He was passive and not curious and relied on platitudes. But the combination of persuasive popular rhetoric and tactical flexibility revealed his astuteness and resiliency. The historical timing was fortunate. The Carter presidency reflected the inability of Democratic politics and Keynesian economic theory to address the "stagflation" of the 1970s. The oil shocks, high taxes, and inflation of the Carter years were sitting ducks for the charge that excessive government was the problem and that a liberated, more entrepreneurial economy would see a return to prosperity in which, in a populist message, all would benefit. Americans wanted an optimistic view of the world and associated Jimmy Carter with sour pickles. The hour was right for Reagan.

The book is worth reading for the very strong case studies alone, each in a separate chapter, on the economic program of the first year, the passage of tax reform, the savings-and-loan debacle, and the administration's skill in balancing lipservice to free trade with defensive measures to serve domestic politics. One will also find a close analysis of conservative economic ideology as it impinged on Reagan—supply-side economics, monetarism, orthodox budget balancing—and how Reagan played these off against one another to his own political advantage.

But the central story is that of the politician who kept to his rhetorical goals but compromised in particulars whenever it was politically necessary. He began well by selecting James Baker as the White House chief of staff, over the ideologue Ed Meese, and thus permitting Mike Deaver, the most skillful of all public relations men, to join with Baker and other pragmatists in balancing populist rhetoric and practical politics, but without ever saying a word about his strategy. Reagan was more impressive publicly than he was privately, and necessarily so, because he knew how to dramatize public issues and to radiate personal authenticity, but he saw no purpose in engaging in detailed discussion of economic policy choices. He would set the general direction and rely on others to do the work. But, and this is Sloan's key conclusion, Reagan knew how to push policy in a general direction by trimming and tacking and compromising whenever necessary. Thus, although he and his economists had not expected Paul Volker, chairman of the Federal Reserve Board, to tighten the supply of money so sharply in 1981 and 1982, Reagan was happy to sign tax increases in 1982 that mollified Volker and led to a looser Fed policy as well as economic recovery and reelection in 1984.

Sloan gives us the delicious irony that Reagan often did better as a politician when he was ignorant of policy substance. Too much briefing in the first debate with Mondale confused him because, habitually, he would try to learn it all, and his mind did not work that way. Keep to the big picture and rely on him to turn the dynamics of debate in his direction by rhetoric. That was what worked. I once heard Richard Darman, Baker's assistant in the White House and at the Treasury, say that Donald Regan, the second-term chief of staff, did not understand that the president was dependent upon staff aides to give him reasonable options from which to choose. Regan's effort to control the streams of advice thus served his boss poorly. A passive president needs more help than an active one. Sloan makes all this very clear. It followed that Reagan's staff assistants were fearful of the president doing things on his own.

This behavior would seem to be at odds with the prescriptions of presidential scholars that presidents must have detailed knowledge of their "power stakes" and use staff assistants to achieve "multiple advocacy." I am not so sure. Reagan may very well have known his power stakes without delving into policy substance, and he surely did balance pragmatists and ideologues always in his own political interests. But it is also the case that ignorance had costs. Supplyside economics claims to increase savings, but that did not happen. Economic recovery was achieved at the price of enormous budget deficits. The United States became a creditor nation in both trade and foreign investment. New jobs did grow but not real wages. Companies became leaner and meaner, with high salaries for executives and boons for stockholders but little for wage earners and their unions. Reagan showed other politicians how to deal rhetorically with economic and social inequality and thereby retarded our politics. Promise that markets will do it all and tacitly blame the victims for not grasping their bootstraps. Turn a deaf ear to poverty. The poor do not vote.

Reagan was an original whose conservatism was all his own. That is why the Republicans are so desperate to find a worthy replacement. That is not likely to happen. His abilities had developed over a lifetime. At the end of the day, I agree with John Sloan that Reagan was a successful and effective president but not a moral leader.

Desegregation in Boston and Buffalo: The Influence of Local Leaders. By Steven J. L. Taylor. Albany: State University of New York Press, 1998. 259p. \$54.95 cloth, \$19.95 paper.

Christine H. Rossell, Boston University

This craftsmanlike analysis, rich in detail, will serve as a resource for students of school desegregation and urban politics for decades to come. I have written extensively on school desegregation in Boston and, to a lesser extent, in Buffalo and was appointed by Judge Garrity in 1976 to monitor its implementation in Boston, but nevertheless I learned something new on virtually every page. I have not read a more detailed analysis of these events or its participants.

Taylor compares the characteristics of the two cities in order to explain the differences in community reaction to school desegregation. Boston erupted in violence with the implementation of a mandatory court-ordered reassignment plan in 1974 and a second plan, greatly expanded, in 1975. In Buffalo there was no violence when a voluntary desegregation plan was ordered by the court in 1976. The author's central argument is that the difference in the reaction is largely explained by the behavior and attitudes of local leaders.

Taylor describes in great detail the legacy of ethnic politics in the two cities, the politics of school desegregation, and the response of local leadership and parents. He convincingly argues that the presence of black school board and city council members in Buffalo caused whites on these bodies to behave responsibly, whereas their absence in Boston meant that white members were free to behave irresponsibly. Where

I disagree is with regard to the influence of these leaders on the community.

The Boston school desegregation plan was one of the most extensive mandatory reassignment plans in the North, not only in 1974 but also in 1975, when the deck was completely reshuffled, and in 1976, when it was modified again. The Buffalo plan was voluntary for whites during its first five years. My research indicates that the percentage of whites mandatorily reassigned in a school desegregation plan is the single most important factor explaining white flight, white protest, and the position of leaders, who are supportive of voluntary plans and opposed to mandatory plans. Thus, it seems to me that the influence of leadership in Boston and Buffalo on public response cannot be definitively determined, since the plans are so different.

Nevertheless, I learned a great deal from Taylor's analysis of local politics, and he convinced me that the presence of blacks on the Buffalo school board and city council influenced their white peers to be more moderate in their rhetoric. I would add, however, that their greatest influence was probably on the judge. The responsible behavior of the Buffalo officials during the liability hearings probably convinced the judge to allow them to implement a voluntary remedy. Of course, the experience of Boston also helped.

Overall, this book succeeds admirably at being objective and scholarly, but there could have been more appreciation of the tragedy of these events. A second and in some ways related criticism is that I object to Taylor's contention that school desegregation remedies had no grand design: "These informants seemed to believe that busing, like prohibition, was a social experiment designed to achieve a broad objective. This interpretation of the order is squarely at odds with the federal courts' reasoning behind ordering busing. The reason for busing is simply the enforcement of the Fourteenth Amendment as interpreted by the 1954 Brown decision" (p. 203).

Thus, Taylor rebuts his informants' complaints that school desegregation accomplished nothing with the assertion that the courts never intended to accomplish anything more than the mechanical dismantling of a de jure segregated school system. I do not think that is correct. The Boston Public Schools were not de jure segregated in the way that the South was. There were many integrated neighborhoods with integrated schools in 1973, the year before desegregation. Indeed, there was a smaller percentage of racially isolated schools and more interracial exposure in the Boston public schools in 1973 than there is today. Only nine years after desegregation and while still under court order, there was less interracial exposure than when the schools were convicted of de jure segregation. Taylor acknowledges this, but he asserts that integration was not the goal.

I disagree and think the Boston school desegregation plan has all the elements of a Greek tragedy. I was a member of the Citywide Coordinating Council, and I remember that we did have grand plans of social engineering, and we did want to increase integration. So did the judge. Indeed, to my mind the only thing that explains the northern court rulings, with their massive systemwide reassignments on the basis of the flimsiest of de jure evidence, is that these judges saw themselves as social engineers implementing a remedy that would accomplish integration not only in the schools but also ultimately in society. Sadly, however, we cannot determine whether it did.

The fact that Boston was not a true de jure segregated school system like the pre-Brown South also helps explain some of the reaction of the community and its leaders. Boston paid the highest price—massive, systemwide busing—

just as if it had had a system of total apartheid. Only two years later, Buffalo and Milwaukee were allowed to desegregate with a voluntary plan, although they had virtually the same level of racial imbalance in the schools (the index of dissimilarity ranged from .63 to .72 in these three districts, with Boston in the middle). I think these inconsistencies are important explanations of why the people of Boston and their leaders still feel a real sense of injustice and the citizens of Buffalo do not.

Taylor concludes that a major lesson is the futility of trying to seek the reversal of a decision when the violations are blatant. Except for the notion that it is necessary for the violation to be blatant, I could not agree more. But this only heightens my feeling that Taylor has done a wonderful job of documenting what in the end is a tragedy, or at the very least, an existentialist experience.

The Sound of Money: How Political Interests Get What They Want. By Darrell M. West and Burdett A. Loomis. New York: W.W. Norton, 1998. 220p. \$15.00 paper.

Diana Evans, Trinity College

For decades scholars have debated the degree of influence wielded by interest groups over public policymaking. E. E. Schattschneider's classic, The Semi Sovereign People (1960), has influenced generations of political scientists with the argument that representative democracy offers the masses the potential to get their way against large wealthy interests by expanding the scope of conflicts that initially advantaged those interests. At the same time, it was recognized that the interest group system itself favors the same moneyed interests. Building largely on Schattschneider's argument that such interests have inherent advantages in conflicts over public policy, Darrell West and Burdett Loomis challenge both his optimism that conflict expansion benefits the unorganized and the modern pluralist view that the proliferation of interest groups, including mass-based citizens' groups, over the past three decades has resulted in broadened representation of the unorganized public in policymaking. They acknowledge a time in the 1960s, 1970s, and 1980s when citizen groups and social movements scored significant policy successes. They argue, however, that large, well-organized, wealthy interests have learned to exploit modern information sources and communications techniques in ways that enable them to shove aside poorer, more broadly representative groups and dominate public debate over a wide range of issues. They challenge pluralist theory by arguing that changes in interest group influence techniques have undermined the traditional system of countervailing powers.

The book elucidates in Part 1 the theoretical argument and describes the techniques used by moneyed groups to influence policymaking. Part 2 consists of four case studies that illustrate the type of activism described in Part 1: Clinton's health care reform effort, the Contract with America, telecommunications policy reform, and incremental reforms of health care policy. Finally, the authors assess the broader effect on American democracy of the changes they observe and evaluate various reform proposals.

The central argument is that large, wealthy interests have learned from more broadly representative interests, such as citizen groups, the techniques of conflict expansion. They have used their superior resources to develop those techniques with the goal of controlling the definition of policy problems, the policy agenda, policy alternatives, and ultimately policy outcomes. In the modern advocacy world, wealthy interests employ such techniques as polling, focus

groups, and commissioned studies to create broadly persuasive, yet often misleading and manipulative, policy narratives that serve their purposes. Using the techniques of modern public relations, they communicate those narratives both to the public and to policymakers.

The methods of dissemination are as broad as they are expensive: Elite and mass advocacy campaigns and grassroots organizing are added to more traditional inside lobbying techniques and election campaign contributions. In communicating their narratives, these wealthy groups rely on frequent repetition to drive home their point to a public and to policymakers who otherwise might miss the message in this age of information overload, drowning out other voices through sheer persistence and ubiquity. These techniques are used openly by many groups; in addition, those that prefer for strategic reasons not to be connected publicly to a cause wage "stealth" campaigns, working under misleading and innocuous covers to conceal their association with an issue. West and Loomis argue that these efforts are aided by journalists who fail critically to examine issue advocacy campaigns that are unconnected to elections. The result is impoverished public discourse and, ultimately, given the centrality of interest groups in the governance of the United States, a threat to representative democracy itself.

Once we make allowances for the growing sophistication of the techniques used in developing and mounting issue advocacy campaigns, the obvious question is: How new is the concentration of influence among wealthy interests? If the cases examined here represent a new level of dominance of public policy debates by large interests in the 1990s, we should expect that, if those cases had occurred in the 1970s or 1980s, the broader public would have been more effectively represented by some of the groups now drowned out of the policy debate. Yet, if that were the case, would there not have been serious consideration if not enactment, given Republican dominance of the presidency, of some sort of national health care policy before the 1990s, when public interest groups presumably were stronger?

More to the point, do the policy outcomes that West and Loomis describe pose a genuine challenge to existing theory? They note correctly that issues of high visibility normally are expected to reduce the influence of moneyed interests. They argue, however, that high issue visibility today actually enhances the influence of large moneyed groups, as the fate of Clinton's health care reform proposal illustrates (p. 106). Alternatively, it can be argued that in that case, government played its traditional role of taking up the public's concern with health care, socializing the issue through Clinton's reform proposal. Had it not, the private interests threatened by the proposal would not have needed to expand the conflict to try to shift the balance of forces to their side. That they were able to influence public opinion through often misleading ads supports the authors' argument.

It is also the case that the president's proposal suffered from his own bad timing, as West and Loomis themselves argue: Labor and consumer organizations that normally would have supported health care devoted their resources to fighting NAFTA, which the president chose to push at the same time (p. 80). Thus, the influence of antireform interests on a reform-minded public can be explained as well by the president's priorities. Those priorities prevented a corresponding and countervailing escalation of the conflict by more broadly representative interest groups; if it had occurred, it may well have produced a classical pluralist outcome closer to the public's desire for expanded health care availability. Admittedly, those broadly based groups were forced to choose between two important conflicts, while the

private sector, with its wider range of organizations and interests and greater wealth, was able to mobilize both for NAFTA and against health care reform.

The fact that the health care case arguably conforms to conventional interest group theory as well as to West and Loomis's own argument does not negate the value of the authors' challenge to the dominant way of thinking about interest group influence. Through a number of carefully analyzed examples, West and Loomis make a plausible case that we have reached a point at which the concentration of wealth and the development of sophisticated techniques of opinion manipulation and lobbying have combined to concentrate even more influence in the hands of those who already had the lion's share of it. In the concluding section of the book they advocate several reforms, including expanded disclosure requirements that would cover issue advocacy and outside lobbying campaigns, as well as a proposal, which is

somewhat less realistic, to enact truth and accuracy provisions for mass advocacy communications. Yet, because the processes that led to the increased sophistication of public advocacy campaigns arose from the wealth of certain kinds of groups, none of the potential reforms offers great promise for reversing the phenomena described in this book.

The Sound of Money is a book with a point of view, lively and engaging. It will be stimulating for students and scholars alike. Although its theoretical basis is familiar, its challenge to pluralist theory is intriguing. The case studies that buttress the argument are well documented and of interest in themselves. Some readers may disagree with some of the authors' interpretations of recent public policy battles, but West and Loomis make a vigorous case for their analysis of changes in the interest system. Finally, they offer a warning that should be taken seriously by all who are concerned about the effect on democracy of the unequal distribution of resources in the interest group system.

Comparative Politics

Legislative Politics in the Arab World: The Resurgence of Democratic Institutions. By Abdo Baaklimi, Guilain Denoeux, and Robert Springborg. Boulder, CO: Lynne Rienner, 1999. 278p. \$59.95 cloth, \$22.50 paper.

Mehran Kamrava, California State University, Northridge

Amid the growing literature on the prospects and preconditions for democracy in the Middle East, this is a welcome addition that adds considerably to our knowledge of the institutional dynamics at work in the transition to democratic rule in the Arab world. The authors correctly maintain that the literature on political liberalization in the Middle East has largely ignored the pivotal role of institutions in general and of legislatures in particular. In fact, much of the recent work on the topic concentrates on the economic imperatives of political liberalization or the compatibility, or lack thereof, of religious and other cultural forces with democracy. Legislative Politics in the Arab World, however, sets three primary objectives: (1) Demonstrate the analytical utility of concentrating on legislatures in better understanding processes of democratization in the Arab world; (2) highlight the many contributions of legislatures to the processes of democratic transition currently under way; and (3) provide information on key legislative developments in the six countries on which the book focuses: Lebanon, Morocco, Jordan, Kuwait, Yemen, and Egypt (p. 6). The book meets these objectives with unqualified success.

The book is especially important in two regards. Part 1, which provides a framework for the analysis of Arab legislatures, contains one of the most rigorously constructed theoretical treatments of the prospects for and obstacles to institutionally based transitions to democracy in the Arab world. Such transitions, whose less rapid pace in comparison to those in Latin America and Eastern Europe has attracted considerably less attention, have been taking place in three general phases: the drafting of a national pact, initiated at the behest of state actors themselves; the initiation of a national dialogue, designed by incumbent elites to enhance their declining legitimacy or that of their unpopular policies; and the assertion of the legislature's authority (pp. 33–43).

A second contribution, in Part 2, is the wealth of empirical data on the various aspects of the legislatures in each of the six countries. Such details of legislative inner workings—the historical evolution of national parliaments, assessment of internal capacities and weaknesses, the constitutional responsibilities of each chamber, important legislative initiatives, and more—are usually found in relation to European political systems. In this important respect, the book provides invaluable and in many instances original data. The legislatures of Morocco, Yemen, and to a lesser extent Kuwait have been especially neglected, and the book considerably enhances our knowledge of the institutional evolution of these and other Arab states in general and their legislatures in particular.

There is, however, no mention of the research methods employed in acquiring the rich empirical details. It appears that the authors relied on a combination of interviews with Arab parliamentarians, field research and observations, and the available (overwhelmingly English) literature. If this is indeed the case, it should have been spelled out, preferably in the acknowledgments or the introduction. It is unclear, for instance, how the data on the distribution of parliamentary seats in Lebanon's various elections were obtained (pp. 87, 88, 97, and 100). Other insights, for example, on Yemen's little studied parliament (pp. 214–6), also leave the reader hoping for an indication of how the information was acquired.

There is a larger problem. The authors repeatedly assert that in one form or another parliaments are playing a most central role in the democratic transition in the Arab world, the assumption being that such a process is indeed under way. But on a number of occasions the authors reveal their own discomfort with this assumption. "Instead of manifesting itself through the downfall of existing regimes," they assert at one point, for example, "change has taken the form of attempts at relegitimizing the system through elections and the incorporation of new groups into the institutions of the state" (p. 31). This trend, which indeed has been taking place throughout the Arab world, does not indicate a meaningful rearticulation of existing (i.e., nondemocratic) patron-client relations between state and social actors. It points instead to modifications within existing patterns of state rule amid mounting domestic difficulties. As the authors' own analysis shows, in fact, both Egypt and Yemen have moved farther away from democratization in recent years than was once believed. Even in discussing the three countries in which

parliaments are more active than ever before—Jordan, Morocco, and Kuwait—the authors do not convincingly show that the legislatures are any more than safety valves designed to deflect criticism from monarchs who have changed their modus operandi only slightly. The authors themselves concede that only in Lebanon does the legislature play a meaningful role in political life, but "even there, Syria's overwhelming influence constrains very significantly what parliament can and cannot do" (p. 42).

The inconsistency in the assessment of on-going democratization in the Arab world stems largely from the sole focus on the institutional forces at work in Arab politics. From the outset, the authors state their intention to examine the contributions that Arab parliaments have made to widening the scope of the political arena and, over time, legitimating new rules for the political game. But exclusive focus on the reviving of the legislature runs the risk of overlooking equally important social and cultural developments in concurrence with which institutional changes take place. Although the authors did not set out to examine all the imperatives of Arab democratization, they could have paid closer attention to the larger sociocultural contexts within which institutional changes are unfolding. In Morocco, for example, there is controversy over the live broadcast of parliamentary debates (pp. 118-9), but how widely watched are these debates? The answer would reveal a great deal about the level of popular skepticism or legitimation regarding the legislature as a viable forum for political representation or, alternatively, as yet another appendage to an otherwise authoritarian system. Repeated reminders that voter turnout is consistently low—in Jordan, only 44% in the 1997 elections (pp. 165–6) also warrant more in-depth analysis of the perceptions of social actors toward legislative bodies.

These shortcomings notwithstanding, Legislative Politics in the Arab World is a book of profound importance, both for its theoretical contribution to the institutional dynamics of democratization and for the risk empirical data it presents on the legislatures of Lebanon, Morocco, Jordan, Kuwait, Yemen, and Egypt.

Party Discipline and Parliamentary Government. Edited by Shaun Bowler, David M. Farrell, and Richard S. Katz. Columbus: Ohio State University Press, 1999. 304p. \$59.95 cloth, \$22.50 paper.

Paul V. Warwick, Simon Fraser University

Parliamentary systems are typically investigated under the premise that parties are so disciplined that they, rather than the individual legislators, can be taken as the relevant parliamentary actors for most intents and purposes. In recent years, however, this assumption has come under increasing scrutiny, stimulated in part by the emergence of noticeable disciplinary lapses in certain parties, such as the British Conservatives, that once epitomized the trait. Attempts to account for such lapses naturally raise the question of why we should expect it to be otherwise; why, in other words, should elected representatives give up their right to speak and vote freely, a phenomenon so at odds with the American congressional experience?

This collection of essays emanates from a workshop on the issue held as part of the 1995 Joint Sessions of the European Consortium for Political Research (EJPR). It is common in collected volumes that the individual contributions are uneven in import and divergent in approach; with EJPR workshop collections, these properties are especially likely because there is typically no organizing criterion beyond the

topic itself. So it is here. The collection is bracketed by two interesting theoretical pieces based on fundamentally opposed premises, and they enfold a number of country or party-level studies that rarely make reference to either of them. What we have, then, is not so much an attempt to bring coherence to the topic of party discipline as an attempt to open it up.

How well does it do this? At the theoretical level, rather well indeed. The most stimulating piece is undoubtedly Laver and Shepsle's "How Parties Emerged from the Primeval Slime." This contribution represents an extension to intraparty politics of their well-known and controversial "portfolio allocation" model of government formation and survival. The model's key departure, and the source of the controversy surrounding it, is the assumption that ministers in coalition cabinets are free to impose their own policies in the portfolios they are allocated; for Laver and Shepsle, reconciling policy differences among coalition partners is not in the theoretical cards. In this extension of the model, the assumption is made somewhat more palatable by pointing out that parties may have an advantage in maintaining a stable of ministrables (potential ministers) with slightly different policy biases. This would make it possible for them to offer potential coalition partners a range of different policies (albeit a relatively small one) for any portfolio; more to the point, it may enhance the chances that an equilibrium coalition government can be forged. If this observation points to intraparty diversity, Laver and Shepsle also demonstrate that their model might facilitate party discipline by allowing one faction to elicit total submission from the other factions if it alone represents a policy stance that figures in an attractive equilibrium outcome.

The other theoretical book-end is Mitchell's "Coalition Discipline, Enforcement Mechanisms, and Intra-party Politics." Mitchell's approach is fundamentally opposed to that of Laver and Shepsle: It assumes that coalition partners must reconcile their policy differences. The implications for party discipline are serious because party leaders must sell the compromises they accept in cabinet to backbenchers (noncabinet members), who do not receive the office "perks" that can make them so much more digestible. The detailed investigation of two Irish coalition governments shows that a large number of the destabilizing threats they faced consisted of backbencher revolts against the concessions given up by party leaders for purposes of coalition preservation. These challenges typically did not reach the level of voting dissension, not because discipline was imposed by the leadership but because the leadership caved in. The lesson: There may be a good deal more intraparty disunity than the highly disciplined voting in West European parliaments suggests.

After reading these two pieces, one cannot help but wish that the remaining empirical fare were more oriented toward testing them out. As noted earlier, this was not the purpose of the workshop. Instead, the empirical contributions tend to go their own ways: two on dissent in the British Conservative Party, four on party discipline in other European parliamentary systems, and two on the state of affairs in the European Parliament. Some have interesting observations of their own. Sánchez de Dios, for example, points out that discipline in the relatively new Spanish parliamentary system emanates from the remarkable array of institutional powers that party leaders wield over backbenchers. Raunio observes that the sequence in which legislation is voted on in Norway allows leaders to tolerate voting dissent at earlier stages in the consideration of a bill in the knowledge that it will not affect the final outcome; in this sense, party discipline in Norway may actually be higher than the roll-call voting suggests.

In other cases, the attempt to say something new leaves previous stones unturned. Mershon's investigation of the coexistence of high cabinet instability with low coalition turnover in Italy, for instance, ignores the tradition of French literature on the topic. More significant is that, in placing the blame for Italian cabinet instability on the low office and electoral costs of defecting from a coalition, she does not mention that these low costs are implications of Sartori's conceptualization of polarized pluralism. This need not mean that Sartori is right—perhaps it is time for a new explanation—but his framework surely ought to be considered.

In general, the reader should not look to this collection to resolve the puzzle for party discipline but to broaden an appreciation for its many facets. What is clear is that numerous factors may encourage or undermine party discipline in parliamentary regimes; finding out which ones are operative and under what circumstances will not be easy. There is a subterranean side to the party discipline we normally take for granted in parliamentary politics, and much of it remains to be mapped out.

Reinventing Russia: Russian Nationalism and the Soviet State, 1953-1991. By Yitzhak M. Brudny. Cambridge, MA: Harvard University Press, 1998. 352p. \$45.00.

Lowell Barrington, Marquette University

Nationalism is one of the most important topics in both international and comparative politics. One cannot understand the collapse of the Soviet Union without understanding this topic. Yet, the discussion of nationalism during the Soviet period generally centers on the strength of nationalism during the Gorbachev reform era and on the nationalism of the non-Russians. Yitzhak Brudny's excellent book instead focuses on the entire post-Stalin period and on Russian nationalism itself.

Brudny begins with a concise overview of the topic of nationalism and a thorough discussion of its Russian variants. He effectively distinguishes between Russian and "official Soviet" nationalism. Russian nationalism is especially difficult to understand because Russian nationalists themselves have difficulty answering the central questions: Who belongs to the nation? What territory should the nation control? Brudny offers his own typology of Russian nationalism (liberal, conservative, radical), describes the policy positions of the three camps, and links this to a discussion of post-Soviet nationalism in Russia, a theme to which he returns in an all-too-brief epilogue. In a useful table (p. 10), he also lays out the major publications associated with the three nationalist movements both during and prior to perestroika. This table gives an introduction to the periodicals and movements that dominate the discussion later, although one of the few editorial problems in the book is that some of the publication titles are either misspelled or incorrectly capitalized throughout the table.

The rest of the chapters provide a tour, chronological and thematic, of the evolution of post-Stalin Russian nationalism. There are individual chapters on 1953–64 and 1965–70, but Brudny uses three chapters to cover 1971 to 1985. The last two chapters before the epilogue then return to the chronological approach, covering 1985–89 and 1989–91, respectively. This mixing of the thematic and chronological leads to some repetition among chapters, although that is arguably hard to avoid in a book spanning several decades and numerous subjects.

The main argument is that the roots of Russian nationalism in its various forms today can be found in the tolerance and even encouragement of it by Khrushchev and Brezhnev, especially in the "village prose" movement. Particularly under Brezhnev's "inclusionary politics" approach, Russian nationalists were wooed, ultimately unsuccessfully, by the Soviet leadership. Through detailed discussions of publications such as Molodaya gvardiya, Nash sovremennik, and Novy mir, Brudiny points out how these Russian nationalists created problems for the Soviet leaders—both by stressing the value of the village and the Orthodox Church and by criticizing social ills, such as alcoholism and the steady destruction of the environment.

The problem of alcoholism in Soviet and post-Soviet Russia is no secret to even casual observers, but the relationship between Russian nationalists and the efforts by Soviet leaders to confront the problem is less familiar. Brudny points out that the explosion of alcohol consumption in the 1970s resulted in a series of articles, letters, and editorials in Nash sovremennik describing the problem and criticizing government policies for contributing to it. At the same time, the publication carried numerous essays critical of the spread of "urban culture" to the countryside and the resulting demographic changes among ethnic Russians, focusing on their declining birth rate. Thus, by the time Western scholars were beginning to identify the emergence of economic and social "stagnation" in the Soviet Union under Brezhnev, Russian nationalist writers had already been openly discussing for years numerous social ills throughout the country and in the Russian Republic in particular.

The discussion of the link, as early as the 1950s, between the Russian nationalist movement and the topic of the environment is a particularly interesting aspect of Brudny's work. Again, scholars interested in the subject have tended to examine non-Russian movements under Gorbachev. Brudny convincingly argues that a movement existed in Russia, and well before Gorbachev's rise to power. Russian nationalists were critical both of specific problems or policies (pollution in Lake Balkal, plans to divert Siberian rivers, and so on) and of the general trend in the Soviet Union toward a more urban, industrial society. The importance of ecology to the village prose movement grew significantly during the 1960s and 1970s, and Brudny argues it had become the dominant topic. Essays and articles routinely contained striking depictions of the increase in pollution of the air, water, and land as a result of Soviet agricultural and industrial policies. On the eve of the Gorbachev era, nationalist hostility to the planned river diversion project was impossible to ignore. By 1986, the concept had been scrapped, handing Russian nationalists one of their most significant policy victories of the Soviet period.

Anyone interested in either the Soviet Union or the topic of nationalism would benefit from reading this book. It covers important Russian nationalist events of the Gorbachev years, such as the publication of the famous Nina Andreeva letter, but it shatters any illusions that nationalists were a tool of the Soviet state before Gorbachev and the assumption that they only got out of control during the glasnost period. Brudny demonstrates that nationalists were already out of control—reined in only by periodic government action, such as the censorship of their attacks on government policy in the nonblack-earth region villages and the dismissal of the Molodaya gvardiya editor. Brudny also convincingly illustrates that nationalists were already wedded to such glasnost-era hot issues as the environment long before the Gorbachev reforms.

Other than the repetition across chapters, the only real weakness of the book is what is not covered. Because of the chosen period, there is only a very limited discussion of Russian nationalism before Stalin (not to mention nationalism under the tsarist system). More on the link between Stalinism and post-Stalin "radical nationalism" would be

useful. Likewise, Russian nationalism in the post-Soviet period is covered just enough to leave the reader wanting more. But these are small complaints. In writing history, one has to draw lines somewhere. Brudny has elected to focus on 1953 to 1991, and he has certainly discussed the topic of Russian nationalism during that period in a highly effective manner. Even with its limited coverage of the Lenin and Stalin years, this is simply the most thorough and thought-provoking work available today on Russian nationalism during the Soviet period. It has important implications for our understanding of the Soviet past, and it provides valuable guidance for those seeking to understand the present and future of nationalism in post-Soviet Russia.

The War in Bosnia-Herzegovina: Ethnic Conflict and International Intervention. By Steven L. Burg and Paul S. Shoup. Armonk, NY: M.E. Sharpe, 1999. 520p. \$49.95.

Francine Friedman, Ball State University

The Bosnian war is over for all intents and purposes. The implementation forces for the Dayton Peace Accords are imposing democratic forms where possible in an attempt to force the national groups in the area to live together in a somewhat civil society. At the time of this writing, NATO planes are attempting to relax the murderous grip of Slobodan Milošević on Kosovo. Perhaps now is a good time for reflection on how all this mayhem came to southeastern Europe. Steven Burg and Paul Shoup have produced a long and extraordinarily detailed study of the events leading up to the Bosnian war as well as the internal and external situation throughout the war. More than that, they have attempted to analyze the motivations and actions of the warring parties themselves, both with regard to each other as well as to the regional and international actors that inevitably became involved in the prosecution and solution of the conflict.

The authors divide the volume into two halves. The first part deals with conditions in prewar Bosnia and Herzegovina, the origins of the war, and the major developments in the conflict through 1994. The second half details the involvement of the international community in the effort to end the conflict as well as the lessons that may be learned from the war itself and the way it was approached by the international community and regional actors. The authors, however, intertwine the parts with frequent references to preceding or succeeding points, so that one is treated to more of a seamless whole than a divided commentary.

Burg and Shoup do an excellent job of reminding the reader that the Bosnian conflict was a most complex and bewildering situation. As they point out in the first chapter, an understanding of the conflict would be narrow if one only embraced "a narrowly ethnic definition" (p. 4). Yet, one is left with the impression that the economic and moral issues that they insist also informed the conflict might have been overshadowed by the ethnic, and especially the political, aspects of the controversy. One strength of the book is that the authors are able to show how the political exigencies of the various actors, both domestic and international, drove their actions.

Another particularly fine feature of this volume is the numerous maps provided in the chapters on the various plans put forward to resolve the Bosnian war. The bewildering array of proposals and demands is more easily understandable with these well-done visual aids.

All in all, this is a quite remarkable and valuable book. The authors have obviously attempted to be as even-handed as possible in presenting the points of view of the various sides,

although their sympathetic explanations of the attitudes and demands of the various Serbian actors may be surprising to a public that has not been exposed to a very sympathetic view of anything Serbian, even of the Serbian victims. Their allusions to hard-headed Bosnian Muslim calculations and actions during the war and the search for peace are similarly rarely dealt with in the public or even academic press. This is a part of the conflict that needed to be examined.

Nevertheless, a few questions remain. The authors imply that a "nascent nationalism" was emerging in late 1993 among the Bosnian Muslims (p. 283). The reader might benefit from a closer definition of the meaning of that remark in light of earlier as well as later political circumstances. That is, do the authors mean to imply that the Bosnian Muslims until this time had publicly expressed little or no national feeling? If that is the case, then the 1991 census in which almost two million Bosnians identified themselves as Muslims (in the national sense) is puzzling ("The National Composition of Yugoslavia's Population, 1991," Yugoslav Survey 33 [1992]: 4-5). One also wonders how that nationalism is being expressed in Bosnia today. While the SDAdominated government is obviously pursuing a chauvinistic policy, expressed by the name Bošnjak that it would like all Muslim citizens to use, anecdotal evidence suggests that many Bosnian Muslims, especially many of the youth, prefer to use a regional identity, expressed in the concept of Bosanac/Bosanka. A thorough discussion of this thorny issue is probably beyond the scope of this book, but more explanation of the nationalistic tendencies of the Bosnian Muslim population would be welcome.

It is interesting that the authors challenge what appears to be an intent by the international actors to remain in Bosnia for a long time: "The international military force deployed to support" the Dayton Peace Accords does not promise "to be long-lasting" (p. 318). Both OHR and OSCE representatives publicly and privately vow that SFOR or some such institution will remain in the area for many years (e.g., Carlos Westendorp, "Don't Bargain with Bosnia," Wall Street Journal, April 6, 1999). Fifty years is the most frequent forecast, with the expectation that one or two generations of Bosnians must be reared under a Western-imposed democracy before the West deems it safe to leave. The authors' point of view is interesting, as would be an explanation for its basis.

These minor points aside, Burg and Shoup have provided the most definitive volume to date on the Bosnian war. They have meticulously documented the opposing perceptions and goals of the combatants and the external actors and have placed them within the context of the events of the time. One must read this volume to understand how the Bosnian war occurred, was prosecuted, and ended.

Restructuring Political Power in China: Alliances and Opposition, 1978-1998. By An Chen. Boulder, CO: Lynne Rienner, 1999. 279p. \$59.95.

June Teufel Dreyer, University of Miami, Florida

This is an important book. The author's central argument is that, since the 1970s, political reform in the People's Republic of China (PRC) has been determined by the interaction of three major forces: the central elite, local party cadres, and the subordinate population; the latter generally are termed "the broad masses" in Chinese communist parlance. In An Chen's analysis, these interactions, engendered by the reforms that began in the late 1970s, have created the basis for the PRC's evolution toward democracy.

This thesis can be stated simply, but the research on which

it is based is complex and multifaceted. The author has skillfully woven together Western social science concepts of political reform with a wide range of Chinese sources and his own interviews. The restructuring, he finds, has taken place in two stages: 1978 through 1986 and 1986 to the present. The first stage was characterized by pragmatic considerations. Deng Xiaoping exploited mass dissatisfaction with his predecessor, Mao Zedong's atrocities, and promised drastic changes. An Chen opines that, with the PRC on the brink of social upheaval, Deng's priority had to be the restoration of order and stability. Yet, he could not simply restore the party-state institutions of the 1950s, with their quintessentially Maoist combination of political indoctrination, organized terror, and legitimacy conferred by winning the civil war in 1949. In the interim, citizens had become more intractable and disobedient, and the revolution had lost its elan vitale.

Deng's reforms were primarily economic: privatization of agriculture, large-scale opening to foreign investment, and somewhat tentative measures to increase the autonomy of enterprises and encourage the urban private economy. The underlying structure of political power remained essentially the same. By the mid-1980s, Deng and his advisers realized that economic reforms were being thwarted, since they depended on transforming a structure in which local party cadres had a vital stake. This was not simply a matter of individual prerogatives being harmed, but impinged on the entire party-state apparatus. Massive official corruption had also become a problem and was greatly resented by the citizenry. While a drastic shake-up was in theory possible, there was a serious possibility that such a move would destroy social stability.

Stage two began when the thirteenth party congress of 1987 took a different approach: major political reform. The two key institutional changes were the separation of the party from government and greater authority for the legislature, the National People's Congress. The general citizen's indifference to party-government activities of the early 1980s was gradually replaced by a fresh political awareness and concern with protection of civil rights. Elections of deputies became hotly contested, and more strident voices in the legislature could affect the leadership's policy choices. Deng showed impressive manipulative abilities, playing the "citizen card" (i.e., the legislature as the "highest organ of state power") and the "party [committee] leadership card" through a strategy of alignment, dealignment, and realignment among the three major relevant forces; the central leadership, local and grassroots cadres, and ordinary people.

Leaders in Beijing attempted to work out a certain balance of power at local levels between the party committee and the people's congress, poised to shift to the opposite group if one side became despotic, arbitrary, or seemed to be slipping from the center's control. Although the leadership's efforts to develop social support through reforms achieved some success, Deng recognized, especially after the Tiananmen demonstrations of 1989, that party cadres remained the mainstay of the communist regime. Hence, substantial power resources had to be left in the hands of party cadres, who were selected by higher levels and kept out of the reach of the masses. The organizational guarantee of party leadership was needed in order to prevent mass participation from exceeding the political and ideological limits determined by the ruling elite. Anything more, they argued, would plunge China into political chaos. A cynic might interpret this argument as a thinly veiled rationale for protecting their own privileged positions.

Deng's solution had the unintended effect of making political corruption difficult to control. What emerged from political reform was not a true market but a welter of networks protected by cadres and bureaucrats and acting in secret. The press was not free to publicize corruption scandals, since this would tarnish the party's image. Anonymous letters of complaint could be written to party committees, governments, judicial organs, and congresses to demand an investigation. But, as An Chen points out, it is important to notice who undertook the task. In general, people's congresses and deputies were excluded from investigations of not only party cadres but also government officials. Even judicial officials asked party committees for instruction, especially if senior officials were involved. In short, impartial investigations were rare.

An Chen argues that, these deficiencies notwithstanding, the past two decades have provided the masses with a training ground for democracy. Citizens became familiar with representation procedures, albeit not yet genuinely democratic procedures, and learned how to use legal rights to protect themselves. The signs of decline in party influence were visible as early as 1989, when party organizations and cadres in many regions were unable to dissuade citizens from taking to the streets.

Perhaps An Chen could have addressed the question of whether the decline in party influence and unbridled corruption could have resulted in some other future for China than democracy, possibly the "thugocracy" experienced by parts of the former Soviet empire or a resurgence of regionalism and localism. But An Chen cannot be accused of starry-eyed naiveté and is aware of the rise of both territorial and class politics. This is not an easy book to read; there is nothing wrong with the author's prose, but the topic is so multifaceted that any competent analysis must be as well. Those who choose to essay it will learn much; this is quite simply an excellent book.

The Basques, the Catalans, and Spain: Alternative Routes to Nationalist Mobilization. By Daniele Conversi. Reno: University of Nevada Press, 1997. 312p. \$44.95.

Cyrus Ernesto Zirakzadeh, University of Connecticut

Daniele Conversi has written an intricate, interesting book about the emergence and development of nationalist politics in two areas within Spain: Catalonia and Euskadi (or the Spanish Basque country). The first parts of the study focus on the economic, political, and cultural histories of both regions since the mid-nineteenth century. In the second half, Conversi develops a complex, general theory about why nationalist movements sometimes contain groups that engage in political violence.

In the historical chapters, Conversi juxtaposes Catalan and Basque responses to economic development. Nineteenth-century industrialization posed myriad problems for small merchants, craftspersons, and urban professionals. The often disgruntled members of the urban middle class provided most of the leaders and followers of the nationalist movements.

Although both the Catalan and Basque movements arose in Spain at roughly the same time, their social settings differed. Catalonia, Conversi reports, had been commercially developed long before the late nineteenth century. It also had repeatedly experienced waves of immigration. As a result, Catalan nationalists for the most part viewed all residents, including recent immigrants, as potential contributors to a commercially and politically vibrant Catalan nation. Basque nationalism arose in a very different context. Most parts of Euskadi were precapitalist before the late nineteenth cen-

tury, and residents had little previous experience with large numbers of immigrants from other parts of Spain. Basque nationalism, consequently, tended to be considerably more anticapitalist, antiindustrial, religious, and xenophobic than Catalan nationalism.

Conversi is not a simple structuralist in his historical thinking. He is sensitive to the role of human agency, particularly in the construction of symbols and ideologies. The ideological founders of Basque nationalism, according to him, never successfully synthesized the region's disparate worries about the ramifications of industrialization into a coherent doctrine. The Basque Nationalist Party often collapsed into warring factions and splinter groups because there was no positive program or symbol around which all nationalists could rally. There was no "core value," to use one of Conversi's key concepts.

Conversi argues in the second and more theoretical half of the book that the absence of a stable nationalist core value explains the emergence and persistence of political violence in the Basque region during the 1960s, 1970s, and early 1980s. Nationalists, needing to find common ground, agreed temporarily that expressions of daring self-assertion would become the litmus test of one's nationalist convictions. The preoccupation with confrontational action predisposed many (especially younger adults) either to engage in armed action or to support friends and neighbors who did. Conversi acknowledges that other circumstances most notably the extraordinary amount of state repression in the Basque region during the Franco regime—reinforced the general predisposition toward armed action. But repression alone, Conversi insists, cannot provide a complete explanation for nationalist violence during the 1960s, 1970s, and early 1980s. There also had to be a particular type of shared core value.

Conversi's general point—that the presence or absence of particular core values can affect the day-to-day activities of a nationalist movement—intuitively makes sense. After all, articulated programs and evocative images make certain types of political action possible. Conversely, the absence of programs and images makes certain types of action inconceivable. People are mobilized, in part, by visions and values.

The author's general argument about culture, however, also raises some theoretical questions that social scientists might want to discuss. Some of these puzzles have to do with his assumption that a durable political movement requires members who are nearly uniform or homogeneous in their beliefs and assessments (pp. 164, 199, 243, 263, 268). Is this true? How much consensus on core values does a nationalist movement or party (or any movement or party, for that matter) have to attain before the movement or party becomes stable? Can a successful and durable movement (or party) be an alliance or partnership among people with different values? If political alliances among disparate interests can occur, why was the pressure for ideological innovation greater for nationalist leaders in the Basque region than for those in Catalonia?

A second set of empirical and theoretical puzzles arises from Conversi's generalizations about the unusually strong appeal of an activist ethic among younger Basque nationalists (pp. 148, 203–4, 226, 238, 251). First, was "activism," in fact, valued more intensely there than in Catalonia (or, for that matter, in other parts of Europe)? Second, in terms of the origin of the new core value, was the popularity of activism due primarily to the absence of unifying core values among Basque nationalists (pp. 149, 222, 226, 238–9, 243, 255, 263)? Might the fascination with activism have been a reflection of broader, Europeanwide cultural trends?

Finally, several methodological questions arise about the

alleged causal connection between activism as a core value and violent political behavior (pp. 102, 203–5, 234–5, 251–6). Is there an established body of empirical evidence showing that people who deeply value aggressive action also have a propensity to violate the rights and lives of others? Cannot activism also lead to nonviolent behavior, particularly once liberal-democratic options are available? What does the literature on political behavior suggest about the social and psychological factors that intervene between core values and courses of action? Has Conversi, in his construction of a causal model, tried to control for such variables?

The above sets of questions suggest the theoretical boldness of this monograph. Conversi has written a scholarly book, in the best sense. In the historical section, he cites an extraordinarily broad range of sources. He is scrupulously fair in handling both scholarship that corroborates his views and scholarship that challenges them. The result of his labor is a dependable, readable, and detailed synthesis of recent scholarly work that probably should be on the shelf of every serious student of Basque and Catalan nationalism. Conversi's own ideas, especially in the second half of his book, are novel, eclectic, and provocative. His theories about core values and about their behavioral consequences diverge noticeably from mainstream social science theorizing about political culture, political violence, and movement integration. This book, as a result, compels us to look at current political events in new ways. Regardless of whether one agrees with the author's theoretical points, Conversi says a lot of interesting things.

Democratic Politics in Latin America and the Caribbean. By Jorge I. Domínguez. Baltimore, MD: Johns Hopkins University Press, 1998. 253p. \$59.95 cloth, \$19.95 paper.

Scott Morgenstern, Duke University

This is a compilation of insightful chapters penned by Domínguez for various other volumes in the last several years. Each deals with a different aspect of democratization in Latin America, and each provides a wealth of interesting hypotheses to lead the reader to the books from which they were drawn.

Domínguez attempts to generalize about the disparate chapters by focusing on two factors that he claims are underdeveloped in the democratization literature. The first is the role of individual leaders in navigating a country through the democratization and consolidation processes. His evidence for this thesis is a chapter on "technopols," which focuses on the biographies of five political leaders in four countries. He hypothesizes that their successes in the economic realm came from a deep understanding of the political process. The chapter offers interesting descriptions of the ideas and policies that were implemented under the watch of these leaders, but it neglects to explain how they gained their influence or the weight of their influence relative to others. For example, Domínguez cites Cardoso's (when finance minister of Brazil) use of Congress to pass economic reforms and Argentine Economy Minister Cavallo's concern with politics as key examples of technopols' grasp of politics and economics. He fails to explain, however, the role of the president or the degree to which the Congress modified proposals. Furthermore, it is difficult to gauge the importance of this political know-how to the policy process or the deepening of democracy, since important parts of these programs were implemented by presidential decree. The chapter fails to provide a full development of the theory or details about case selection or hypothesis testing, but it is an interesting introduction to this aspect of policymaking in posttransition Latin America. This and other chapters may lead readers not only to the volumes from which they were drawn but also to new research directions.

The international system is the second factor that Domínguez uses to tie the volume together. His short but interesting conclusion suggests that international factors have had a variable role in opening political regimes around the globe but have had very consistent and positive effects on democratic consolidation. The varying influence on democratic opening is clear in the contrast between military intervention that led to political openings in Panama, Haiti, the Dominican Republic, and Grenada, on the one hand, and the lack of centrally important international factors that led to the opening in Brazil, Chile, or Uruguay, on the other. He also cites the end of the Cold War, which had hardened the Cuban regime and Central American dictators as a positive international force.

Here again, however, the purpose of the discussion seems more to spur further research than to develop the theory. Advancing this promising thesis would require a careful look at the change in international policies and environment. In the chapter on the Caribbean Domínguez offers several examples of the international community intervening to shore up weak democracies or fend off democratic opponents. Without this causal argument, his discussion of the consistent effect of the international system on consolidation seems more a by-product of outcomes than a careful look at specific policies. This is an important limitation, especially in light of how the international system has challenged the young democracies by pushing often harsh economic reforms on them. In the Caribbean, for example, Domínguez focuses on the "statist bargain" in which pork, fed by parties to voters, generated loyalty to a democratic system. The fall of international commodity prices, therefore, adversely affected the democracy. Democracy did not fail in the Caribbean, however, and thus Domínguez attributes more weight to the positive international support for democracy than the adverse consequences of the international economy. Development of the thesis about how the international community supports democracy, which may rely on the contingency of international loans to complete the restructuring, remains for future testing.

The other chapters touch on these two central themes but focus on other issues. Chapter 1 examines why the Caribbean nations, despite long odds, have built and sustained democracy. The effect of the international environment enters through Domínguez's discussion of how British colonialism generated a set of political institutions propitious for democracy. As noted above, he also cites several cases of international intervention when democracy was threatened. Chapter 2 focuses on democratic transitions in Central America, noting not only the role of international pressures but also the importance of economic distress and the hardship of long civil wars to explain political liberalization. Chapter 3 takes a similar course; entitled "Constructing Democracies," it argues that in addition to the international environment, political institutions, economic reforms, and the shape of the military determine democratic success.

After the chapter on technopols, which, as noted, discusses the importance of leadership, chapter 6 looks at the electorate, in particular the changed values of Mexicans since the surveys by Almond and Verba in the 1950s. It describes the newly prized democratic values and implies that once the last vestiges of authoritarianism are cast off the change will help Mexico sustain democracy. The final case-specific chapter focuses on possible directions for Cuba. Domínguez sets up

several scenarios, including a continued political monopoly with more market openings, a more repressive regime (in response to possible uprisings), and a regime transition. Leaders and the international climate are certainly central to all these. The point of the discussion about a transition scenario, however, is to explain the role of cultural and historical traditions. These, it is argued, may lead Cubans to support a strong leader and an interventionist state, a combination that may have negative consequences for democracy and economic development.

In sum, like other collections, this book seeks a theory to generalize about loosely connected chapters, rather than propose a theory and then seek evidence to support it. Still, the new introduction and conclusion, combined with the previously published work, offer a useful survey of issues and an interesting group of hypotheses for further study.

Coalition Government, Subnational Style: Multiparty Politics in Europe's Regional Parliaments. By William M. Downs. Columbus: Ohio State University Press, 1998. 316p. \$50.00 cloth, \$19.95 paper.

Kaare Strøm, University of California, San Diego

William Downs does what coalition analysts often preach but rarely practice: examine coalition politics in subnational arenas. Specifically, the author compares executive alliance building in the regional assemblies of Belgium, France, and Germany. His main interest is in the membership of the coalitions that ran the regional governments in these countries between the early 1960s and the mid-1990s. His book clearly demonstrates that these coalitions are worthy of our attention.

Coalition Government, Subnational Style falls into four parts and nine chapters. The meatiest part is the third, which contains chapters 5 through 7 and most of Downs's original empirics. The four chapters that collectively set the stage for this analysis are in aggregate a bit long, but they give a thorough introduction to coalition bargaining and particularly to what Downs calls "constraints on rationality in government formation." Part 1 also includes a commendable discussion of methods and research design. A main problem in studying subnational coalition bargaining is that it is so heavily conditioned by the relevant parties' national-level strategies. Therefore, any attempt to analyze regional politics in isolation from this supergame is bound to be incomplete. This is a challenge to which Downs responds admirably. Indeed, his most obvious contribution lies in the ways in which he captures the contextual and organizational constraints of subnational coalition bargaining.

More successfully than most coalition analysts, Downs makes use of both objective and subjective data. His objective data represent 109 Belgian provincial governments, more than 90 German ones, and 44 from the French Fifth Republic. The key to the "underrepresentation" of France lies in its truncated history: Downs's French data cover only the first two elections (1986 and 1992) after Mitterrand's reform of regional government. In addition, Downs surveyed regional assembly members in these countries, using a closed-ended mail questionnaire. These surveys had about 80 items, but Downs gets the greatest leverage from questions concerning the members' perceptions of their electoral and organizational environments. For each country, Downs selected a sample of (four to nine) regions in which he polled all regional assembly members. The roughly 600 completed questionnaires correspond to a response rate approaching 40%. Finally, the author complements these data with less formal elite interviews.

The main concern of Downs is to understand the constraints under which politicians make their coalition bargains. He assumes that party leaders are goal oriented, rational, and motivated by office, power, career, policy, party democracy, and social change concerns. But different politicians give priority to different goals. Thus, "loyalists" give priority to the former of these objectives, and "radicals" to the latter. The behavior of political parties is determined not only by the ratio of radicals to loyalists, the party's "organizational radicalism," but also by other aspects of the organizational context, such as national coalition commitments and the vertical distribution of authority within the party.

A second intervening force is the electoral context by which Downs primarily means the volatility of the voters. The more volatile the voters, the more party leaders have to condition their choices on the expected electoral consequences. But such relationships are more subtle in subnational politics than in the national arena. The constraining force of volatility depends on the nationalization of the electorate, that is, on the extent to which citizens in their voting decisions respond to national or subnational events. The most constraining electoral environment, therefore, is one in which votes are highly volatile and subnational party switching can be decoupled from national trends, perhaps because voters are attuned to local rather than national politics.

These are the main ideas that guide the analysis. The argument that Downs presents in chapter 3 builds on a complex conceptual scheme rather than a deductive or parsimonious theory. Nonetheless, Downs formulates 13 hypotheses that he tests in the various empirical chapters. He finds that electoral considerations do influence subnational coalition politics and that regional politicians do not always defer to their national leaders. In chapter 8, the last empirical chapter, the author asks whether regional politics has served as testing grounds for potential national coalitions. Can regional coalitions thus have an informational purpose? Downs explores this issue by examining the record of regional coalition innovations, by posing pertinent questions to his regional and national respondents, and through case studies of three such experiments. He finds that regional parliaments indeed serve as laboratories for national coalition politics.

These are important questions and interesting results. Yet, the concluding chapter is somewhat of a disappointment. It is difficult to fault Downs's characterization of the different national experiences, or even his more analytical points, but the conclusion lacks a powerful punch line. In part, this is because Downs typically only seeks to establish that his various constraints have certain simple and rather plausible effects. Rarely does he discuss the interaction of these effects, or their specific implications for our received wisdom. In the process, Downs implicitly falsifies a set of null hypotheses, but few of these are propositions with great curb appeal or accepted truths with famous names attached to them. One therefore occasionally wishes that Downs had formulated his argument more boldly and with greater attention to its implications.

This is a worthy and appealing book that should be read. Anyone with an interest in the politics of Belgium, France, or Germany will find interesting and little-known anomalies in the description of their regional coalitions. These countries have all gone through extended periods during which the national coalition has been constrained by fairly rigid coalition formulas. Downs shows that underneath this rigidity, quite a bit of coalitional deviation and experimentation has gone on regionally. Theoretically, the book tells us less about the end results of coalition bargaining, such as who gets what, when, and how, than about the multitude of circumstances that nudge negotiators in one direction or another. Downs

certainly drives home how large and wide open the agenda for the study of coalition politics really is. He also demonstrates how much we can learn from all those political negotiations that typically do not make the headlines of the national, much less the international, media. The most intriguing lesson, and one that the field surely needs to heed, is the importance of learning and experimentation in coalition politics.

The Entrepreneurial State in China: Real Estate and Commerce Departments in Reform Era Tianjin. By Jane Duckett. New York: Routledge, 1998. 273p. \$49.95 cloth, \$17.95 paper.

David Zweig, Hong Kong University of Science and Technology

Since 1982, whenever China's leaders have tried to trim the bureaucracy and the state budget by cutting the number of state employees, a "company fever" has emerged. Faced with redundancy and financial constraints, bureaucrats, on their own initiative, have established semiindependent companies within their administrative field; these rely on profit-making activities but also drew heavily on their administrative ties to improve their business opportunities. Some of these companies' profits also pay for the bureau's own administrative costs. Only a few political economists studying China have paid any attention to this widespread and remarkable phenomenon. Jane Duckett's book, which uses the growth of these companies to build a new model and theory of the socialist state in transition—the "Entrepreneurial State" (ES)—fills a very important gap in the study of the post-Mao reforms.

Duckett differentiates ES from the "developmental state" and the predatory "rent-seeking" state. Unlike the developmental state, which facilitates but does not actively engage in business activities, bureaus in the ES are risk takers; they invest capital in firms that compete among themselves and with other companies for market share and profits. Unlike the rent-seeking state, these state-financed companies adapt to, rather than resist, market activity; they are productive rather than simple seekers of rents; and they support, rather than block, reforms of the socialist economy. Duckett's model, therefore, can explain why China's gradual market transition has succeeded without the high costs of a "big bank," as occurred in Poland or Russia, because state agents, who under the rent-seeking model should resist reform, actually have personal and organizational interests in seeing reform proceed.

Conceptually the book is innovative and thought provoking, but it lacks the empirical data to prove or test the existence of this new state. Also, the historical analysis ends in 1993, before it was possible to assess the significance of these companies for China's socialist transition.

To her credit, Duckett outlines the type of micro- or firm-level behavior predicted by her model. She also readily admits when she sees groups of firms acting in ways that do not fit her model. Her two case studies, the housing market and the commercial goods sector, document the emergence of many new companies from government bureaus, but surprisingly there are no case studies of any companies in the book, so Duckett cannot prove that they are actually motivated by the values she attributes to the ES, such as profit seeking, entrepreneurship, productiveness, and adaptiveness. To test her model, we need the source of firms' incomes and how much they benefit from their ties to their bureaucratic allies. We need to hear the managers speaking for themselves, describing how they view the market, outlining their

own motivations and future plans, and showing how their actions and those of their firms herald the emergence of a new entrepreneurial role for the state.

Although a survey of managers probably would have been impossible, Duckett does not even present in-depth interviews with managers of these new companies, which might show how their mentality and motivations have shifted away from colluding with their bureaucratic allies and toward embracing the market. In fact, Duckett admits that for the bureaucrats who spawned these companies, "the profit motive seems to have been secondary to their desire to find alternative employment for their officials" (p. 136). Perhaps this is true of the managers as well. But Duckett cannot assess their motivations because, as the list of informants in the Appendix shows, her interviews were almost exclusively with Tianjin bureaucrats. She interviewed only seven employees in real estate companies, none in any commercial firms, and perhaps no managers at all. Therefore, while her theory is indeed provocative, the gap between theory and data is simply too great to convince us that her portrait of the Chinese state is any better than the two models that she challenges.

Furthermore, Duckett can assert that the phenomenon she is studying is entrepreneurial and not rent-seeking because of her narrow definition of the latter. Rents are not merely wasteful activity that results from competition over licenses or because individuals or groups spend time lobbying for favors or access to licenses, rather than carrying out productive activity. Rent-seeking also entails profits that are earned because government regulations create inflated rather than market-clearing prices that are attained through legitimate business activity. In the case of China, profits that result from regulations limiting market access to a few firms spun off from government bureaus fall within the definition of rent-seeking, since the consumer and society at large are paying highly distorted and inflated prices that create wealth for state bureaucrats and their allies in these firms.

Is this a real market, full of productive entrepreneurship, or merely bureaucratic capitalism? Will these companies develop their own interests, pull away completely from their bureaus, and create a true market economy, or will collusion between the companies and their bureaus—which Duckett recognizes—trap China in a cycle of endless corruption? Duckett's model leads us to be optimistic, but only time will tell. And here, again, Duckett's interviews cannot help us, because they were completed in 1992–93, just as the most recent "company fever" occurred. Duckett, recognizing this limitation, often speaks in terms of possible trends, but she needed to return to Tianjin in the mid-1990s for follow-up interviews if she wanted to show that ES really exists or has taken hold.

Clearly, Duckett is onto something important. Chinese bureaucrats have been given strong incentives to "love the market." My own research on China's "open policy" suggests that such companies can become self-interested and highly profit oriented, and therefore they can act in ways that undermine the regulatory regime established by the state to monitor global transactions. Duckett's firms, therefore, could be the harbinger of a new force that will help expand the domestic market, decrease the size of the bureaucracy, and facilitate a smooth transition away from the planned economy.

The formation of companies does not prove Duckett's theory, however. As Duckett recognizes, the principles under which these companies function is the true test of whether an entrepreneurial state is emerging. We need to know much more about the internal workings of these companies and the

extent to which their market-oriented activity is undermining the regulatory regime inherited from China's planned economy before we can determine whether a new pattern of state behavior, heretofore unseen in any other reforming socialist or postsocialist state, is emerging.

The Rights Revolution: Lawyers, Activists, and Supreme Courts in Comparative Perspective. By Charles R. Epp. Chicago: University of Chicago Press, 1998. 326p. \$45.00 cloth, \$17.00 paper.

C. Neal Tate, University of North Texas

The Rights Revolution is an important book that is truly rare. It is a genuinely comparative analysis of the political/policy roles of a sample of national courts, based on a solid foundation in the literature on law and politics in the sample nations. Most rarely, it is an empirical analysis of a systematically selected sample of the actual decision-making behavior of those courts. To my knowledge, there is no comparable work, one that is genuinely comparative and based on solid, relevant empirical data on national courts. The only study that comes close in spirit, design, and execution, although not in breadth or elegance of exposition, is Schubert's Political Culture and Judicial Behavior (1985).

There is a growing realization that courts around the world are up to something—or at least are in many places expected to be up to something—that appears to be expanding their political significance or policy roles. Nevertheless, to date no study can match Epp's in comparative design, empirical analysis, and consistency of execution. It should be a role model for those who wish to work in this important and expanding research field.

Epp begins with the well-known conclusion that in recent decades the United States has undergone a "rights revolution." His analysis does not treat this conclusion as axiomatic but instead demonstrates the evidence in various ways. Epp then focuses on an important and deceptively simple research question: Why did the rights revolution occur? More accurately, what were the sources and conditions for the rights revolution?

Epp recognizes several conditions as possible or likely explanations for the occurrence of the rights revolution. Most important are "constitutional guarantees of individual rights and judicial independence, leadership from activist judges (especially Supreme Court justices) who have been willing to use those constitutional provisions to transform society, and the rise of rights consciousness in popular culture" (p. 2). More important still, he contends, is the development and existence of a "support structure for legal mobilization, consisting of rights advocacy organizations, rights advocacy lawyers, and sources of financing, particularly government-supported financing" (p. 3).

Having telegraphed his central finding before reaching page 5, Epp certainly reduces the suspense, but that does not make his book less worth reading. Instead, he proceeds to show how answering the question the way he does, rather than in other ways, has important implications for contemporary approaches to politics, institution- and constitution-building, and democratic government. He also conducts the kind of comparative analysis necessary to document that his answer is the most plausible one. To demonstrate the superiority of the support structure explanation, Epp recognizes the need for a comparative research design and develops and executes one.

Epp analyzes four nations: Canada, Great Britain, India,

and the United States. All represent the Anglo-American legal/judicial tradition. He chose similar nations to control the possible confounding effects of legal and judicial variables associated with that tradition. This leaves him free to analyze the possibly differing effects of constitutional guarantees, judicial leadership, public rights consciousness, and rights support structure on the development of a rights revolution.

After laying out his analytical puzzle, Epp presents in chapter 1 a theoretical exposition of the conditions for the rights revolution. In chapter 2 he documents the occurrence of and analyzes the "standard explanations" for the rights revolution in the United States. Chapter 3 explains the significant roles apparently played by the support structure created by modern rights advocacy organizations, changes in the legal profession, and the emergence of new sources of financial support for the revolution.

Epp then analyzes the Indian situation. India is an "ideal environment" for the development of a rights revolution: It has strong constitutional guarantees of rights and of judicial independence; its Supreme Court justices have encouraged and even solicited rights litigation in a manner that will surprise those unfamiliar with that court; and there appears to be a widespread public rights consciousness, at least among the educated elite. There is also abundant evidence that India has had longstanding problems of rights abuse, particularly with regard to prisoners, the accused, and women. Epp finds both quantitative and qualitative evidence to warrant the conclusion that India has experienced at best a weak rights revolution. The apparent explanation? India has not developed a significant support structure to sustain the revolution.

Great Britain is at the opposite pole from India. It has a political and legal environment that has not been very supportive of rights litigation. Its constitutional system is not rights based, and British judges have exercised little leadership in support of rights, even though there has been some significant development of public rights consciousness. Nevertheless, Epp finds that the country has experienced a modest rights revolution, apparently founded on a support structure of rights advocacy groups, the growing size and diversity of the legal profession, and publicly funded legal aid.

Finally, Epp analyzes Canada, which has experienced a "vibrant" rights revolution in the last three decades. Why? Canada has changed from a nation that, like Great Britain, had little constitutional or legal foundation for rights, Supreme Court justices who did not exercise rights-relevant leadership, and limited public rights consciousness to one that, like the United States, now exhibits all the enabling conditions for a rights revolution. The final piece was added to the Canadian rights puzzle only in the 1980s, when a support structure for rights litigation developed.

It may be worthwhile to let Epp have the last words: "Neither a written constitution, a rights-supportive culture, nor sympathetic judges is sufficient for sustained judicial attention to and support for rights. Protection of civil liberties and civil rights depend, in addition, on a support structure in civil society.... Participants in constitutional democracy would do well to focus their efforts not only on framing or revising constitutional provisions, and not only on electing judges who interpret them, but also on shaping the support structure that defends and develops those rights in practice" (p. 205).

Namibia's Post-Apartheid Regional Institutions: The Founding Year. By Joshua Forrest. Rochester, NY: University of Rochester Press, 1998. 408p. \$49.95.

Gretchen Bauer, University of Delaware

Over the last decade, dozens of African countries have sought to make a transition from authoritarian to democratic rule. In some countries, such as postapartheid Namibia and South Africa, the transition has been successful, while in others it has failed, stalled, or been reversed. For countries such as Namibia and South Africa, the challenge is now to consolidate fragile democracies. One aspect of this, insufficiently covered in the vast literature that has emerged to chronicle democratization in Africa, is the creation and institutionalization of strong regional and local level governments. Joshua Forrest demonstrates what a significant contribution to democratic consolidation regional institutions can make, and in so doing he helps fill a gap in the literature.

Forrest's book combines a rich empirical base with a carefully articulated conceptual analysis drawn from the field of public administration. The author conducted a prodigious amount of field research in Namibia during 1993—"the founding year" of Namibia's regional institutions. This included 115 semistructured interviews with regional councillors, regional governors, officials of the Ministry of Regional and Local Government and Housing (MRLGH), and other government ministries and offices, traditional leaders, national councillors, members of parliament, development workers, and more. The book is further based upon observations of hundreds of hours of regional and national council meetings in nearly all of Namibia's 13 regions and the capital, Windhoek.

In analyzing the findings, Forrest focuses upon both the macro level, where policy and decision making take place, and the micro level, where the daily activities and behaviors of members of Namibia's regional institutions are located. He uses a "forward-mapping perspective" in order to interpret relations between regional and central government and a "backward mapping analysis" to investigate the organizational capacity building of Namibia's new regional institutions. Forrest contends that such an organizational approach "can significantly inform the comparative study of state change, particularly in newly established democracies, by assessing public officials' activities and contacts both within the inner circles of national level decision-making power and, especially, in government units located within less formally empowered niches of the state's administrative hierarchy" (p. 2).

Especially for those interested in Namibia, but also for those who follow emerging democracies, Forrest's findings are fascinating. It has been clear since the drafting of Namibia's independence constitution in 1989-90 that the now ruling party, Swapo, never favored the creation of a second legislative house—the National Council, composed of members elected by regional councils. It feared (quite unnecessarily) that such a regionally based chamber would be dominated by other parties. But the level of condescension and indifference during the founding year from some members of the National Assembly portrayed by Forrest as urban elites-toward the National Council-seen as rural and "working class"—was unexpected. Such attitudes were evident, for example, in the National Assembly's refusal to interpret broadly the legislative powers of the National Council and in the assembly's failure to provide higher levels of infrastructural and legal support to the council.

Similarly, it has been clear since independence that the MRLGH was never interested in ceding any substantive

powers to the regional governments, first elected in 1992. This sentiment was embodied most clearly in the statement by MRLGH Minister Dr. Libertine Amathila that the regional councillors' most significant role would be to provide the ministries with information about their constituencies, along the lines of "how many chickens and goats there are" (p. 72). But the depth and breadth of such resistance to empowering the regional councils and governors revealed by Forrest is again surprising. For example, the MRLGH interpreted the 1992 Regional Councils' Act in such a way as to grant only part-time status and an allowance (rather than full-time status and a salary with benefits) to regional councillors. In Forrest's view, this was a clear-cut decision by officials of the MRLGH to "denigrate the role of the councillors" (p. 76). In a similar vein, the MRLGH interpreted the role of the regional governors very narrowlyconsidering them to be governor of their regional council only, rather than governor of their region.

Despite these and many more impediments, both regional and national councils managed to survive and even thrive during their founding year. The National Council established its own set of standing rules and orders, lobbied hard for much needed staff and legal advisors, eventually got its own new space adjacent to the National Assembly, and transcended party divisions in favor of a National Council identity. Most important, it came to perform a significant grassroots transmission role by serving as a "state-society connecting agency," acting on behalf of Namibia's predominantly rural areas. Similarly, the regional councils, councillors, and governors all assumed roles far more significant than the MRLGH ever imagined. Regional councillors and governors alike took their position seriously and made every effort to meet their obligations as they understood them, despite severe resource constraints. Councils in nearly every region tackled significant issues during their first year, ranging from drought relief, to economic development, to their own organizational issues. In the end, according to Forrest, by insisting on challenging the obstacles strewn in their path, the regional and national councils are playing an important role in asserting the concerns of the rural majority and in consolidating democracy in Namibia.

Namibia's Post-Apartheid Regional Institutions provides unique insights into the crucial early years of institution building in Namibia, and at the regional level, which is seldom sufficiently examined. The book is an excellent model for investigations of state building and democratization in Africa and elsewhere. As such, it will very much appeal to a wide audience of political scientists and Africanists alike.

Rendering unto Caesar: The Catholic Church and the State in Latin America. By Anthony Gill. Chicago and London: University of Chicago Press, 1998. 204p. \$41.00 cloth, \$15.95 paper.

Stathis N. Kalyvas, New York University

The allocation of social science research to the issues vying for attention is oddly uneven. Some matters tend to attract great attention, while others remain for a long time in disproportionate obscurity. The allocation process appears not always to take into account the importance of the issue at hand. For example, research in European politics has long privileged the study of left-wing parties despite the fact that right-wing parties have played at least as defining a role in politics. One of the most blatantly underrepresented topics in social science research is religion, particularly church-state relations. Despite its obvious political and social relevance,

this issue has for a long time remained mostly in the hands of antiquarians and constitutional legal scholars rather than social scientists.

There are indications that this is slowly changing. Consider the study of secularization, which has long been the prominent research program in the sociology of religion. As in modernization theory, the main prediction of secularization theory is that economic and social development will cause religion to fade. Since religious practice has failed to vary as predicted, the addition of new sets of conditions to salvage the core of the theory gradually has become dominant. The study of religious practice has been revitalized, however, by the recent infusion of an incentive-based, "microeconomic" approach. Thinking of religion as a "product" produced by "religious firms" is bound to be controversial, but the empirical returns so far have been extremely encouraging.

Anthony Gill successfully adapts and expands insights from this recent wave of research. The empirical puzzle Gill identifies is politically relevant and theoretically compelling: What explains the political position of Catholic churches in Latin America vis-à-vis authoritarian regimes? Why do some churches ally with these regimes while others oppose them? Despite its relevance, this question has not been addressed before, at least never in a systematic and comparative fashion.

By addressing this issue, Gill embarks on the first sustained effort to define the microfoundations of state-church relations and test them systematically. He correctly points out that religious belief per se may be placed outside the realm of rationality, but leaders of religious institutions are subject to concerns and constraints similar to those of their secular counterparts: Bishops are also bureaucrats running large organizations. Gill begins by specifying a model of statechurch relations based on simple and highly realistic assumptions. On the one hand, given that states minimize the cost of ruling, ideology is the least expensive method of obtaining popular compliance, and churches specialize in the production of ideological norms and values, it then follows that states will seek to cooperate with churches in order to minimize the cost of ruling. On the other hand, given that churches maximize membership and are vulnerable to both free-riding and competition, they will seek protection from competition through cooperation with states.

This is particularly true for Catholic churches, which are vulnerable to competition for a number of reasons. Because monopolized religion underproduces religiosity, a Catholic church suddenly facing competition from Protestant churches will suffer substantial membership losses. These will trigger a major political reorientation, and eventually the church will dissociate itself from the authoritarian government. The underlying mechanism is this: Protestant growth is typically fueled by mass conversions of the poorest segments of society. Unless the church is willing to oppose a regime that blatantly enacts antipoor policies, it has no hope of retaining its members, let alone bringing those who defect back to its fold. In other words, "if the Church was to remain a spiritual and moral force in Latin American society, it needed to match the pastoral efforts put forth by the Protestant churches. Having been associated with the political and economic elite for so long, a credible commitment to the poor meant publicly distancing itself from abusive governments" (p. 120). A Catholic church in a monopoly position does not face the risk of membership loss, so it lacks any incentive to dissociate itself from the authoritarian regime.

The empirical prediction yielded by the model (high levels of religious competition will trigger official Catholic antiauthoritarianism) is falsiflable, and Gill proceeds to check it against the available evidence. His empirical analysis is exemplary. He combines an impressive array of tools and approaches typically found in isolation: regression analysis, controlled comparison, short case studies, and an historical overview informed by a good grasp of the large relevant secondary literature and a number of interviews. He is able to disqualify alternative hypotheses, such as repression, poverty, and internal church reform, as well as scrutinize the outliers. The statistical test provides very strong correlation support for the competition hypothesis. A carefully controlled comparison between Chile and Argentina (in which the Catholic church responded to military regimes in opposite ways) sheds light on and confirms the plausibility of the causal mechanism at work. Finally, the hypothesis is extended both vertically, through a discussion of the future of Catholic Progressivism in Latin America, and horizontally, through a preliminary exploration of the challenges faced by Orthodox churches in Eastern Europe. Overall, this is a superior demonstration of how to combine deductive thinking with rich, comparative empirical research.

Gill's model has yet to be fully specified. This is clear with respect to three broad issues. First, the focus on legitimacy understates the fundamental reality of authoritarianism, namely, its coercive nature. At the same time, stressing legitimacy risks reducing religion to little beyond an "opiate of the people." And while the focus on authoritarian states is fully appropriate to the question at hand, the real challenge is to specify a model of church-state relations under democracy. Such a model will have to take into account the role of parties (which in Gill's model are largely substituted by the state), democratic institutions, and cleavages and issue dimensions.

Second, the mechanism of individual defection and the ways in which it affects the options of both church and state remain opaque. A key assumption is that cooperation with authoritarian regimes hurts churches that operate in competitive religious markets. This is not part of the model's core assumptions but derives from an additional implicit assumption, namely, that the poor maximize ideology (broadly understood to include policy). Yet, the mechanism of individual defection toward Protestant churches turns out not to be driven by ideology. What is being maximized by the poor is the quality of the religious product, including such nonideological features as the density of interaction with priests and pastors. But the nonideological utility function of the poor is incompatible with the ideological response of the church to competition (i.e., its opposition to authoritarianism): The church would be providing the kind of inducement that the poor would be disregarding. Indeed, the church could be more successful by improving its services, such as increasing the number of priests and making priesthood a more attractive career option. Gill points out (p. 186), however, that the church is unwilling to act rationally in this respect; it faces such constraints as a conservative pope and a centuries-old doctrine and tradition. These constraints are not exogenous to the church and ought to be specified in the

Finally, it is unclear why competition is the only option available to a church that faces membership losses. It presumably can lobby an authoritarian state to quell competition. Assuming that Protestantism and Catholicism are interchangeable legitimation devices (i.e., equally strong opiates), then the state will be indifferent between them and will have no incentive to provide preferential treatment to any of them; instead, it will encourage competition. If the church turns antiauthoritarian to fend off competition, then the state will have a strong incentive to favor Protestantism over the newly

progressive Catholic church. Knowing this, the Catholic church should think twice about opposing the regime. Backward induction, however, does not seem to be part of the church's calculus. Assuming that Protestantism is somehow more harmful to the regime than Catholicism, the church can credibly threaten to withdraw its support from the regime in order to obtain the restriction of competition. These examples illustrate the need to introduce a dynamic dimension into the model, possibly through the use of game theory.

The points I raise suggest that the payoffs from specifying a full-fledged model of state-church relations are likely to be considerable. Such a model will generate interesting empirical predictions about the configuration of "religious regimes," both across countries and within countries across time, especially under a democratic regime. Rendering unto Caesar is, thus, not just an exemplar of imaginative, theory-driven, and solid comparative research; it is also the first step in what promises to be a novel and exciting research program.

The Emergence of Insurgency in El Salvador: Ideology and Political Will. By Yvon Grenier. Pittsburgh, PA: University of Pittsburgh Press, 1999. 222p. \$40.00.

William Stanley, University of New Mexico

Yvon Grenier has written a critique of what he calls the "dominant paradigm" regarding causes of insurgency in El Salvador. Many writings from the 1980s argue that the Salvadoran revolutionary movement developed because of a combination of economic inequities, worsening social conditions for the poor majority, and violent repression. Scholars depicted the Farabundo Martí Liberation Front (FMLN) as having emerged as an organic extension of peasant organizations, labor unions, and Christian base communities (CEBs) too long repressed by the government. This bottom-up account, according to Grenier, misses the crucial role played by a core group of revolutionary leaders drawn from the middle class. His book seeks to demonstrate that these revolutionary elites triggered an otherwise avoidable internal war. He traces the bellicosity of the Salvadoran Left to a particularly dogmatic ideology and argues that war resulted because the would-be revolutionaries, as well as far Right elements of the oligarchy and military, eschewed moderate solutions during a crucial period in 1979 and 1980.

Grenier makes a number of valuable contributions, largely by pulling together arguments now widely accepted among close observers of Salvadoran affairs but so far seldom incorporated into published scholarship. Among these correctives is a clarification of the relationship between the emerging guerrilla groups and the "popular organizations." Grenier points out what scholars familiar with the Salvadoran Left already knew or should have known, that the guerrilla cells infiltrated and dominated many popular organizations, using them to foment revolution, often at the expense of the organizations' own goals. He also argues convincingly that by focusing on the influence of Catholic liberation theology on the political values of the rural poor, scholars have wrongly neglected the radicalizing effect of the liberation Church on the urban middle class. Similarly, he goes into greater depth than other scholars in highlighting the political role, and extremely rigid ideological environment, of the national university.

Unfortunately, Grenier does not seriously test whether his ideological approach offers a better explanation than alternatives, such as rational actor and opportunity structure approaches. He asserts the importance of ideology and proceeds to tell a story about ideology. His argument would

have been more convincing had he attempted to integrate ideological, materialist, and political opportunity elements. For example, he fails to establish that the bellicosity of rebel leaders during the crucial 1970-80 period was necessarily the result of ideological factors rather than rational calculation. One could argue that hard-line leadership groups on both sides deliberately fanned armed conflict as a strategy to veto moderate political solutions under which the radicals of both sides would be unlikely to prosper. Rebels and state terrorists alike did not want reforms that would reduce political tension, because their strategies for gaining power depended on polarization and conflict. Granting that ideology and identity shaped these political entrepreneurs' chosen paths to political power, many of the actions Grenier cites as evidence of ideological distortion are plausible (although risky) strategies for seizing control of the state. Moreover, the structural and political conditions that Grenier seeks to downplay arguably shaped what strategies for taking power were available to would-be revolutionaries.

By confining his inquiry to the initiation of the insurgency, Grenier biases his study in favor of finding the ideology of leaders to be important. He largely avoids the crucial question of why people followed the revolutionary vanguard. The willingness of large numbers of people to join or support the fight was a crucial factor in making a maximalist revolutionary strategy feasible, and this willingness was in turn a result of structural preconditions (that Grenier dismisses), combined with skillful manipulation by the revolutionary leaders (see Tom Gibb, In the Shadow of Dreams: El Salvador's FMLN Rebels, forthcoming). Moreover, the initiation of insurgency in El Salvador would not be interesting had the FMLN not become a powerful force capable of fighting a prolonged war. International material assistance was crucial to making it reasonable for revolutionary leaders to attempt to overthrow the government. Grenier almost completely ignores the extensive evidence now available regarding the FMLN's international connections and the effect this had on the opportunities before rebel leaders.

In a book that purports to examine the influence of leaders' ideology, Grenier cites few direct interviews with major actors on the Left. Much of the evidence is from secondary sources, including latter-day confessions of youthful zealotry by leading FMLN commanders (such as those appearing in Marta Harnecker, Con la mirada en alto, historia de las FPL Farabundo Martí a través de sus dirigentes, 1993). Grenier seems rather uncritical in interpreting these sources: One cannot help but wonder whether it was better for FMLN leaders to confess to ideological excesses than to manipulation of their trusting followers. He also ignores some of the strongest recent contributions to scholarship on the Church and on the FMLN's relationship to its followers, including Teresa Whitfield's Paying the Price (1994) and Elizabeth Wood's Forging Democracy from Below: Contested Transitions in Oligarchic Societies (1998). More systematic interviewing might have helped avoid a number of factual errors. For example, Grenier misses very substantial differences among the five rebel groups. The National Resistance and its popular front (FAPU), for example, took substantial risks in 1980 to support reformists in the military, which suggests an openness to moderate solutions that contradicts Grenier's depiction of all factions as equally rigid.

Finally, the account of the role of ideology would be more complete if the author had addressed the idea of counterrevolutionaries. Grenier is too often glib in his treatment of the Right (such as when he declares [p. 41] that the goals of the ruling right-wing party, ARENA, have remained unchanged during the 1990s). Extremism by both sides helped start the

war, and moderation by both sides helped end it. We need a good account of how these changes took place and of how ideological and materialist factors interacted on both sides. Grenier's elegantly written book offers an initial piece of such an analysis, and it correctly calls our attention to the need to reassess why El Salvador's bloody war happened.

Democracy and Civil Society in the Third World: Politics and New Political Movements. By Jeff Haynes. Cambridge: Polity, 1997. 211p. \$26.95 paper.

Manochehr Dorraj, Texas Christian University

The emergence of the two contradictory forces of economic integration and cultural particularism unleashed by globalization has generated much theorizing and speculation among academics and policymakers regarding the nature of the new political reality. Jeff Haynes's contribution is another attempt to reconfigure the meaning and the ramifications of these changes in the Third World in the post-Cold War era. Haynes is particularly interested in the study of indigenous movements (what he refers to as "action groups") and how they affect the development of civil society and enhance empowerment in Third World societies. Haynes is also interested in whether such groups will endure and their political actions will usher in a genuine democratization of political life or are a flash in the pan, and as soon as authoritarian regimes are able to regroup and assert themselves, they will disappear. Finally, Haynes undertakes a valuable comparative study of these action groups. He compares them with their Western counterpart at an earlier stage, thus making many insightful theoretical observations that shed light on commonalties as well as peculiarities of the Third World experience in democratization in recent years.

A major goal of Haynes's research projects is to determine how development can be synthesized with democracy. Haynes accurately sees the rise of indigenous movements in the Third World, with their often populist and nativist political agendas, as a response to economic and moral malaise, what he terms "macro economic decline." Unlike some scholars who confuse the symptom with the cause and focus entirely on the reactive, nativist, and some of the antidemocratic attributes of the Third World noninstitutional movements of empowerment, Haynes sees these "action groups" as movements of liberty, equality, and autonomy. According to Haynes, these are not a threat to democracy; rather, they are at the cutting edge of a democratic revolution. These action groups are an essential part of the civil society and play a crucial role in the democratization process. Haynes provides a wealth of information and comparative data to substantiate his theoretical observations with specific references to select countries in the Third World. His differentiation among substantial, formal, and façade democracy is also helpful in identifying controlled democratization from above, designed to maintain authoritarian regimes in power, from genuine democratization from below, initiated by the political action of civil society.

Haynes's attempt to understand the people of the Third World and their political behavior in the context of the social forces that animate their conduct is laudable. It stands in sharp contrast to the often ethnocentric notion of supposedly authoritarian predisposition of Third World people, which is common among some Western scholars. For example, Haynes asks the pertinent question regarding the alleged undemocratic proclivities of Islamist groups: Why should such groups necessarily conform to what is expected of them by people steeped in often a very different culture and life

experience? Haynes's method of understanding "the other" in its own terms has its merits, but it falls short of capturing the domestic sources of authoritarianism in the region, which have deep roots in culture, history, and institutional developments in the Third World as well as the effect of colonialism. To be sure, structural adjustment programs and the austerity measures proscribed by the IMF and the World Bank as well as the influence of cultural imperialism have played a large role in the rise of the indigenous movements, but these, as demonstrated by many recent examples in the Third World, have not all been movements to foster civil society or build community. Afghanistan, Sudan, and Somalia are a few tragic recent examples of indigenous movements that destroy civil society and traditionalize authoritarianism under the banner of either religious authenticity or nationalism.

In other words, many Third World nations not only have to face the devastating effect of economic dislocations induced by a world economy in which their influence is minimal but also struggle against "demons within," historical legacies of authoritarianism. Haynes also seems to be too willing to grant the label of democracy to regimes in Bangladesh, Mongolia, Nepal, Pakistan, the Philippines, South Korea, and Taiwan, which are in fact a kinder and gentler kind of authoritarianism. And many of them fall in the category of façade democracies that tolerate political opposition only if it is loyal opposition. Contestation of political power is not yet a part of the rules of the game in may parts of the Third World, and democratization is often accompanied by retrenchment and the return of repression.

There may be some ground for optimism, however. One can make the case that just as it took the Western world centuries of struggle to define and bring to maturation its democracy (a project still in the making), Third World societies must go through their own conflicts and concord, steps forward and backward, to define their own brand of democracy. Surely, the Third World democracy at the end will not look anything like its Western counterpart. It will carry the stamp of its own history and cultural baggage as it manifests itself. The major contribution of Haynes's work is that, unlike many, the author understands the basic thrust of this historical march toward democratization and has accurately identified the forces that animate it. Thus, his analysis goes a long way in contributing to the literature on social change in the Third World in general and on democratization in particular.

Booty Capitalism: The Politics of Banking in the Philippines. By Paul D. Hutchcroft. Ithaca, NY: Cornell University Press, 1998. 278p. \$39.95.

Carl H. Lande, University of Kansas

Paul Hutchcroft seeks to explain the Philippines' longstanding "development bog." He attributes it to the country's system of booty capitalism, which he examines in the particular area of private commercial banking.

Patrimonial systems, Hutchcroft notes, following Max Weber, by failing to provide calculability in the political sphere, impede the development of more advanced forms of capitalist accumulation. But there are different types of patrimonialism. The Philippines presents a case of "oligarchic patrimonialism." Unlike administrative patrimonialism, in which the primary beneficiaries are members of a state bureaucracy, the oligarchic variety enables a politically influential business elite to extract privileges from a largely incoherent bureaucracy. Such a system need not decline as economic growth

proceeds, for that growth by itself may only strengthen the existing oligarchs, and these have little incentive to press for a more legal-rational political order that deprives them of their special privileges.

In a useful historical section (pp. 23–30), Hutchcroft explains how the Philippine oligarchy became dominant over the state. Under both Spanish and American rule, wealthy land owning families, many of part-Chinese descent, emerged in the provinces alongside a weak and understaffed colonial administration. When elections were introduced early in the century, these families won control of the legislature. But there emerged no countervailing bureaucratic-aristocratic elite, such as in Thailand, capable of defending the state's resources against plunder by these families. From the beginning, such self-interested oligarchs have pressured public officials to do their bidding.

The remedy for the Philippines, Hutchcroft believes, is not more "state bashing," of the sort fashionable in the United States, but the creation of a stronger state that can provide essential services, tame the country's booty capitalists, and create a level playing field for economic growth. Changes in the Philippine form of government have not improved decision making. Until a more effective bureaucratic apparatus exists, the author concludes, neither democracy nor authoritarianism is likely to produce the type of discipline essential to development.

The bulk of the book is a detailed history of the Philippine banking system. It begins with the American colonial period, which saw the emergence of a powerful native oligarchy and a weak state. The sugar planters routinely raided the Philippine National Bank for production loans and thereby drove it to insolvency. During the postwar years, Philippine oligarchs diversified their interests and, like their Japanese and South Korean counterparts, founded family-owned banks that have provided inexpensive credit to other parts of their conglomerates.

Ferdinand Marcos, under this dictatorial regime, had an opportunity to reform the banking system. Instead, he and his cronies gained ownership of twelve banks and raided the state's financial institutions through loans "at the behest of the President." After Marcos's fall, the Aquino administration (1986–92) could only begin to address the longstanding weaknesses of a banking system that had been exacerbated by its predecessor.

From one regime to the next, favoritism in the allocation of lucrative banking privileges, combined with inadequate bank regulation by weak, intimidated regulators, has permitted family conglomerates to loot the loan portfolios of their family-owned banks. More independent banks, meanwhile, have made extraordinary profits through the collusive maintenance of a large spread between rates for loans and deposits. The results have been low levels of saving, inefficient allocation of credit, and feeble economic growth.

In the final chapter, Hutchcroft describes the efforts of the Ramos administration (1992–96) to curb the cartels and monopolies of major oligarchic families as a part of a broadly ranging program of economic liberalization and privatization. That included opening the banking system to more domestic and foreign competition as well as stricter regulation. Even this, in the banking sphere, was largely stifled by those who were to be reformed.

Hutchcroft attributes Ramos's ability to impose at least partially successful reforms to a new recognition by many Filipinos of their country's place among Southeast Asia's competing economies following the expulsion of the U.S. military bases. More specifically, he attributes it to the influence and political skill of the president's security advisor

and main ideologue, retired General Jose Almonte, who like his chief was determined to free the bureaucracy of the influence of the oligarchy.

Events since the book's publication will have lessened the author's optimism. In the presidential election of June 1998, which ended Ramos's one-term presidency, the voters replaced him with a former Marcos follower and aging movie star, Joseph Estrada. Although he campaigned as the special friend of the poor, Estrada quickly restored much of the wealth and influence of Eduardo Cojuangco, Marcos's most notorious "crony capitalist" and Estrada's main campaign financier, and other discredited figures from the Marcos regime. Less favored businessmen have groused but can do nothing. A recent survey of 21 executives of multinational corporations based in Asia found that, among those that had withdrawn from the Philippines, most had done so because of the capricious court system, ambiguous government policies, and the prevalence of graft and corruption.

Ramos and his staff are now in the political wilderness and so, too, one must suspect, are their hopes for further reform. The Estrada administration meanwhile is preparing charges against those involved in multibillion-peso "behest loans" allegedly granted by government financial institutions to cronies of the Ramos administration.

Hutchcroft will not be surprised at these developments. The major push for change under Ramos, he found, came not from a business sector anxious to alter unproductive modes of production but from a committed core of reformers within the administration. No such core has emerged under Estrada. As the author observes (pp. 248-9), while "top down reforms can help initiate major political and economic transformations," they "must be supported by concerted pressures from below." But "there is as yet little evidence of the creation of a broad social coalition able to sustain reform pressure in future years."

This is an outstanding piece of research and analysis. The author's argument is persuasive and seems well supported by the facts. It makes a significant contribution to the study of Third World political economy. It would have been helpful, however, if the author had included a fuller discussion of the dynamics of an electoral democracy that, for most of this century, has enabled prominent families to dominate, for their own advantage, decision making at local, provincial, and national levels. That would have made clear why a broad and effective social coalition for reform is not a likely prospect.

Women and Democracy: Latin America and Central and Eastern Europe. Edited by Jane S. Jaquette and Sharon L. Wolchik. Baltimore, MD: Johns Hopkins University Press, 1998. 250p. \$49.00 cloth, \$16.95 paper.

Jennifer Abbassi, Randolph-Macon Woman's College

In Prague recently, the director of a small theater described the difficulties of staging performances at a time when there is no social consensus on what is worth laughing about. This director had been an active member of the dissident community and in the late 1970s was one of the few women to sign Charter '77, which demanded the regime's respect for basic human rights. It was easier back then, she reflected, to produce and mobilize when the identity of the enemy was clear and energies could be channeled toward ousting what was not wanted. This perspective from the Czech Republic was not unlike that offered last summer by a Chilean feminist scholar, who credited the country's 17-year military dictatorship with creating the conditions against which a broad

spectrum of women would mobilize. Opportunities to join forces and react to multilayered oppression drew women around active agendas for change. The end of military dictatorships in South America and of communism in Central and Eastern Europe have blurred familiar points of reference and caused a shift in the rationale for women's action. It is no longer as clear as it once might have been to define the contours of democracy for women or even what it means to be liberated and how to get there.

These monumental changes of the past decade or so have compelled researchers to cover new ground related to theories of democracy and democratization. One approach takes a critical view and sees the establishment of any form of meaningful democracy as unattainable under current global social, economic, and political conditions. Another school accepts the democratization process as such and explores the ways citizens define themselves in relation to the state and (usually representative) democratic processes, this definition being the basis for one's involvement in the rebuilding of civil society. Such is the case with the volume under review, which focuses on changes in women's social, political, and economic status related to expected improvements in the distribution of authority and resources.

For the contributors, whether and what kinds of gains are made reflect the nature of each transition under study, with the assumption that the more active women are in demanding improvements and the more willing states are to accommodate such demands, the greater are the prospects for and evidence of democratic consolidation. This sets the parameters for a liberal/egalitarian, rights-oriented approach that sees the range of transitional experiences as potential opportunities for women to expand their citizenship powers. Those working in this vein know democracy when they see it; the challenge is to account for the variations and exceptions. Because the authors are sensitive to the distinct historical experiences of women in the regions under study as well as the particular conditions of each national context, the temptation to overgeneralize is avoided. The approach not only adds to prospects of middle-range theory building around gender and democratization but also gives a realistic picture of the very uneven and nonlinear process of political transition. Its implicit emphasis on the absurdity of the term "posttransition" is, in my view, one of the book's most important contributions.

The combined studies operationalize women's participation relatively broadly. The dimensions of participation are not defined uniformly across chapters, but all relate to women's representation and citizenship. Women's voting behavior, party and interest group involvement, and issuebased legislative agendas are analyzed alongside their activities in nongovernmental organizations (NGOs), communitybased groups, the formal and informal labor markets, and autonomous social movements. Excessive dependency on foreign funding for women's NGOs, the need for linkages between feminist policy agendas and autonomous women's organizations, liberal feminism's critique of home-based activities, and other points of current debate are explored in useful detail. Political economy is not given sufficient systematic attention in the book, but there is some discussion in the chapters of the links between the effects of structural adjustment policies and the circumstances that condition women's political and economic realities and "choices." These are important factors that tie directly into questions about democracy, representation, power, and citizenship.

The authors generally recognize the many barriers that limit women's participation in politics. Faltering ideological support for gender equality, conservative institutions and criticism, suspicion of elitist male-oriented establishment politics, contradictory state policies, and basic noninvolvement of women themselves are issues with which those in the business of theorizing gender must grapple. One would expect a significant relationship between the nature, historical context, and speed of the transition process and the ability of women to construct gendered citizenship. The case studies bear out this assumption. Differences in states' responses to women's demands, differential effects on women of the prevailing neoliberal economic model, and the varied ability of women as actors to adapt to new political realities are just several of the factors that explain the mixed bag of women's successes and setbacks.

The necessary ingredients for democratic consolidation seem to include conditions that invite participatory construction of civil society and conditions for sustainable improvements in the status of women as well as rich public debates over gender and power. If so, then no single case in the volume invites unhindered optimism, which raises the analytical question of how much discrimination against women can be "allowed for" in countries bearing the classification "transitional." Read in this light, the case studies draw attention to the intersection between democratic and feminist theory building and both the opportunities and challenges inherent in that endeavor. At the same time, they test the range of the comparative method at a time when the field of comparative politics is pushing for ways to find patterns in and make defensible generalizations about developments in transitional societies.

In the opening chapter, the editors ask what women's participation can tell us about democratic consolidation. Certainly, the roles they played in bringing an end to authoritarianism reflect the capacity of mobilized women to induce change. The case studies also show that women are now acting in capacities that tie in broadly to the process of postauthoritarian politics and living, a level of involvement which would not contradict the general knowledge that women do not (cannot) bury their heads in the sand in the face of new challenges. Yet, the chapters present substantial evidence that, at least according to liberal egalitarian measures, women's issues and gender agendas are largely on the defensive. This is especially the case in former communist countries, although the numbers and influence of women in the South American cases are down as well. Reductions in the number of women in formal politics, the weaknesses of women's government ministries, state cooptation of women's organizations, deteriorating standards of living, preoccupations regarding family survival, and other forms of economic and political marginalization of women from Peru to Poland very much dominate the stories of women in the book.

How are these realities to be factored into theorizing about women and democracy? If they are assumed to be similar to the struggles that women from the North faced over the last century and part of the growing pains of democratization, the normative undercurrents may result in oversimplistic, overgeneralized, or out-of-context tendency statements. In reading the case studies of Chile and Bulgaria, for example, it is easy to question whether the end of authoritarian rule has in fact meant a transition to democracy along dimensions that mean something to the lives of women. If there is the core of the research question, then these realities suggest at the very least that democratization per se should not be presented as a "given" (as the introductory and concluding chapters tend to do), but rather as a variable that, along with the rather vague concept of "transition," must be defined and systematically tested.

There is a related need in my view to shift focus from women to gender, to include questions of power and identity in a broader socioeconomic context, in order to make the deeper contradictions of the transition process available for analysis. Anything less would deprive readers of the analytical tools needed to situate the factors that complicate the lives of women and the potential evolution of sustainable democracy in transitional societies (and perhaps elsewhere). The book would have been strengthened if this type of discussion had framed the case studies, but as it stands the volume offers much to the debates on women/gender and the prospects for democracy in postauthoritarian societies.

The Transition from Communism to Capitalism: Ruling Elites from Gorbachev to Yeltsin. By David Lane and Cameron Ross. New York: St. Martin's, 1999. 259p. \$55.00.

Terry D. Clark, Creighton University

Lane and Ross offer a study of elite circulation and renewal in the late Soviet and post-Soviet eras. Their thesis begins with the argument that the nomenklatura, the privileged members from among whom the highest positions in the party and state were filled, did not constitute a programmatically and ideologically cohesive group. Instead, it was highly pluralistic, incorporating numerous competing interests. While this description of the Soviet ruling class is in general agreement with the traditional view (e.g., Jerry F. Hough and Merle Fainsod, How the Soviet Union is Governed, 1979), Lane and Ross make the further point that the Politburo (the party organ responsible for policymaking) was not representative. They conclude, in contrast with Hough and others, that it was consequently not capable of integrating the various interests of the party and state and achieving consensus among them. The implication of their argument, while straightforward, is nonetheless somewhat astounding: No one governed the Soviet Union, it merely "went forward under its own momentum" (p. 39).

The authors maintain that this fragmentation of elite interests was institutionalized in the relative autonomy of the economic ministries. Although the party decided on policies, the ministries implemented them in such a way as to defend their interests and preserve the primacy of the bureaucratic style to which they had become accustomed. Party reformers, including Gorbachev, unsuccessfully attempted to overcome the resulting systemic inertia by moving party personnel into the economic ministries and endeavoring to tighten the oversight function of the party Secretariat over the government. These efforts failed as the party aparatus was coopted by the ministries it was charged with monitoring and controlling. Gorbachev, however, went farther by creating a legislative system and an executive presidency to which he attempted to transfer oversight functions. The result was a power vacuum as the Politburo and Secretariat were removed from their traditional positions within the system.

The logic of the presentation falters somewhat at this juncture. Since the Politburo was insufficiently representative to integrate the government and party structures and the party aparatus was coopted by the former, merely undermining the party's role would not in and of itself suggest that a systemic collapse would necessarily follow. Subsequent analysis of the new Russian political elites instead provides a more complete picture of why the collapse occurred. As Lane and Ross demonstrate, these elites, in contrast to those of the former Soviet Union, were drawn primarily from outside the

party aparatus and government. Most were from the intelligentsia. What the authors failed to consider sufficiently is that, in essence, Gorbachev's political reforms created alternative paths to power than those available through the party or government. In so doing, they served as a catalyst for elite fragmentation at a more fundamental level than before. If the system previously functioned on its own momentum despite government autonomy from the party, it no longer could do so in the face of newly elected legislatures in the republica, which served as platforms for counterelites to seize control over agencies of the central ministries. The consequence was chaos as the central government and republican legislatures vied for control at the republic level.

The thesis is not altogether new. What Lane and Ross contribute to the analysis of the Soviet implosion is a more explicitly elite focus, but a unifying theoretical framework is lacking. In fact, any of three such frameworks are addressed throughout the book. The introductory sections focus on the Cold War debate in Soviet studies over whether the Soviet Union was a totalitarian system or better understood as a system of controlled interest articulation within bureaucratic structures. Later chapters focus on elite circulation theory, which permits consideration of the degree to which Russian elites represent a reproduction or circulation of Soviet elites, but the theory's utility is limited to little more than that. No theoretical explanation is offered as to how and why elite circulation occurred or its effect on the post-Soviet political system. Finally, although the authors give some attention to democratization theory, they fail to capitalize on its focus on the rational choices of elites. This has been most eloquently explicated in Adam Przeworksi's Democracy and the Market (1991). Adoption of the framework would have permitted consideration not only of the degree to which there has been elite turnover but also why it occurred and with what consequences for post-Soviet politics.

Despite this, the book is likely to generate substantial interest, largely because the main conclusion is that there has been a circulation of political elites in the post-Soviet era, an argument in direct contrast with the common view that Soviet era elites have been reproduced in Russian political structures. Those who challenge this conclusion will doubtless do so on the basis of the representativeness of the Russian elites included in the analysis. This will be less problematic in the analyses of career patterns, as they are fairly comprehensive, but it will likely be an issue with the elite surveys used to demonstrate disagreement on policy and ideological issues. The fact that fractional membership is used as a means for discriminating between value and attitudinal differences among elites in the Soviet era legislature whereas socioeconomic background is used in the Russian era analysis will also likely generate some criticism. Indeed, for the sake of consistency it would seem that socioeconomic background would provide the more useful typology, given its relationship with career pattern.

Nonetheless, the conclusion will doubtless prove thought provoking, and the debate likely to be generated will add to our understanding of the nature and problems of the current Russian political elites. It is somewhat regrettable that Lane and Ross did not help guide that process by addressing some of the implications of their findings. Of particular interest are the implications for the Russian state of an elite circulation in the central government confronted by an elite reproduction in the provinces and a partial circulation among economic elites.

The Sudan: Contested National Identities. By Ann Mosely Lesch. Bloomington: Indiana University Press, 1998. 336p. \$39.95 cloth, \$19.95 paper.

John P. Entelis, Fordham University

Africa's largest country has produced and reproduced contested political arrangements ever since its independence from Britain in 1956, alternating between brief moments of parliamentary democracy (1956-58, 1964-69, 1985-89), lengthy periods of military dictatorship (1958-64, 1969-85), and concluding with the current era of coalition rule fusing radical Islamist ideology with authoritarian military power (1989 to the present). Overlapping theories of political economy, imperialism, and neocolonialism have been put forward to explain why and how systems break down in Third World settings, but Ann Lesch uses a culturalist paradigm. She concentrates on key cultural, ethnonationalistic, and religious variables in attempting to explain the Sudan's inability to overcome the chronic crises in political legitimacy and political institutionalization that have long beset state and society.

Conceptually and organizationally, this is a study in modern political history that concentrates on developments since 1983. The book is organized chronologically into three parts: "Background and Context," "The Democratic Period, 1985-1989," and "Polarization under the Islamist Government." Long a student of the subject with extended in-country research experience, Lesch uses a wide range of archival, published, and interview data to elaborate a theory of "contested national identities" that explains the Sudan's difficulty in achieving a consensus concerning its national identity. Given the country's enormous size (a million square miles), extraordinary ethnolinguistic diversity (its nearly 30 million people are classified into more than 50 ethnic groups, further subdivided into at least 570 distinct peoples), and clashing religious identities (Christian, Muslim, animist), it should come as no surprise that postindependence rulers have had such difficulties in forging a common identity from which to structure a constitutional arrangement that is both representative and effective. These challenges in nationbuilding have been compounded by the bitter legacy of Britain's colonial divide-and-rule policies, which exacerbated existing ethnoreligious and regional cleavages.

Lesch locates the Sudanese identity dilemma within the broader concepts of ethnopolitics and territorial nationalism as criteria for the determination of membership in the nation-state. This is followed by an elaboration of two contrasting models for governance—the control model and the ethnic pluralist model. The author succinctly summarizes each model's arguments, but her overall conclusion, anticipating the details of the Sudanese experience, remains pessimistic: "Crafting an ethnic pluralist system that respects minority aspirations and creates an overarching identity for the country is a difficult process" (p. 15).

Almost from the Sudan's creation, in the wake of the British conquest in 1898 of the area that currently defines the country, the northern and southern regions have put forth contested interpretations of what constitutes nationhood. The mostly Arab and Muslim north has consistently rejected the south's claim to a separate identity, although that region is populated mainly by Christians and animists possessed of distinct histories, cultures, and languages. British efforts to impose a unitary system of rule aggravated rather than ameliorated these differences. This background helps explain the immediate collapse of the parliamentary system adopted

at independence, a system which assumed "that participants agreed on the rules of the political game and adhered to a basic national consensus" (p. 37). Since neither condition obtained, parliamentary life quickly lost its legitimacy, and regional tensions mounted. It was in the context of this "deflated legitimacy" that the first of the Sudan's string of military coups took place under General Ibrahim Abboud.

Opposed to secularism and a pluralist model of cultural assimilation, Abboud established a pattern of imposed integration in which Arabization and Islamization were to constitute the core identities of a unified nation-state. This was the pattern that future leaders, whether military or civilian, would pursue with disastrous consequences for people both in the north and the south; civil war has consumed the country for more than twenty years, causing widespread famine, disease, and death. Abboud's forced resignation in 1964 and the brief parliamentary interregnum (1964–69) did little to satisfy contesting groups in the north and the south. Rather than provide the opportunity to resolve tensions and conflicts, civilian rule further divided an already deeply alienated society. Not surprisingly, it was the military once again that intervened in the form of a coup in 1969 led by Ja'far Numairi, an army officer initially perceived as antagonistic to sectarian politics and therefore potentially open to a more inclusive formula of national identity.

Yet, the reversion to authoritarian rule could not but undermine efforts at national reconciliation. Ultimately, Numairi shifted decisively toward an extreme version of the control model as he imposed an assimilationist policy that culminated in full Islamization by 1977. With no hope of reconciliation and more alienated from the core political system than ever, the south resumed its armed struggle against the north. It was during this period as well that multinational corporations discovered oil, further intensifying the north's determination to control the south, where most of these discoveries were located. At this point political culture and political economy crossed a critical threshold; aspirations for ethnonational identity could no longer be separated from economic calculations, which made resolution of the Sudanese civil war that much more difficult.

Despite the author's harsh appraisal of the Numairi legacy, which "undermined any possibility of establishing a pluralist political system [and] ensured that the south would react by resuming the civil war" (p. 58), her most bitter criticism is directed at the current Islamist regime and in particular its preeminent political leader and thinker, Hassan al-Turabi. Even more than the military man who staged the military coup in 1989 (Umar Hasan Ahmad al-Bashir), following another brief period of democratic rule (1985-89), it is Turabi's Islamist radicalism, Lesch believes, which is couched in the idiom of pluralist politics but operates within a suffocating system of indoctrination and control, that constitutes the country's greatest stumbling block to national unification. Given the reality of centralized control under a monolithic ideology, any potential for liberal or ethnic pluralism seems remote. It thus appears unlikely, drawing from Lesch's conclusions, that the current negotiations between the warring parties will result in a conclusive peace.

Some may disagree with Lesch's critical portrayal of Turabi's Islamist formula for "democratic" governance, but few will dispute the conscientious manner in which she has articulated the Sudanese national identity dilemma, using an ethnonationalistic framework that students of comparative politics will find instructive and useful.

Comparative Politics: Rationality, Culture, and Structure. Edited by Mark Irving Lichbach and Alan S. Zuckerman. Cambridge: Cambridge University Press, 1997. 321p. \$59.95 cloth, \$18.95 paper.

Herbert Kitschelt, Duke University

This edited volume provides an excellent overview of theoretical alternatives and complementarities in contemporary comparative politics debates. The philosophy of the editors and most of the contributors is to oppose what Lichbach calls a "messy center" of case- or problem-driven empirical research in comparative politics without much theoretical reflection. The book is divided into three parts. In the first, three authors present the basic theoretical perspectives in their purest analytical form. Margaret Levi offers a concise sketch of rational choice approaches in comparative politics. She correctly observes that rational choice is not itself a theory but a basic framework with a "capacity to spawn testable theory with clear scope conditions" (p. 20). Her essay also marks the limits of theories based on rational choice in explaining political behavior.

Also in Part 1, Marc Howard Ross rejects the "imperialism" of utilitarian interest-based accounts (p. 50) and emphasizes the cognitive and evaluative interpretations actors must achieve in order to act on interests. He also readily admits, however, the vagueness of cultural units of analysis and the difficulty of testing cultural explanations. Finally, Ira Katznelson advocates a return to "configurative macroanalysis" in the tradition of Moore and Skocpol. His essay is stronger on comparative logic than structural theory. Several times he emphasizes the distinctiveness of historical institutionalism from rational choice institutionalism (pp. 103-4), but his illustrations with examples from comparative macroanalysis do not convince me that this approach is really different from macrocomparative analysis based on rational choice. Moore and Skocpol, at least, but also more recent authors in the macrocomparative mode, do not try to account for the constitution of preferences and instead analyze how actors pursue their interests in given structural configurations.

The second part of the collection applies the three perspectives to some of the most important substantive areas of comparative politics: electoral behavior (Samuel Barnes), social movements (Doug McAdam, Sidney Tarrow, and Charles Tilly), comparative political economy (Peter Hall), and the state (Joel S. Migdal). All these essays not only offer rather comprehensive reviews of the state of the art in each field but also nicely demonstrate how rationality, culture, and structure account for different aspects of political phenomena. In the contributions by Barnes, McAdam et al., and Hall, however, I would have liked more emphasis on the contest between theories inspired by different paradigms in the explanation of identical phenomena, rather than their complementarity in explaining different aspects of each field. Does not the convivial perspective that many theories can be partially valid in a given field of empirical research promote what Lichbach chastises as the "messy center" and a certain disaffection with theory among practitioners of comparative politics? Only Migdal breaks this consensualist mode by attacking much structuralist and rational choice research on the state and warning against tendencies to divorce the state from social relations. This suggests a culturalist framework, but it is not clear to me whether different conceptualizations of the state/society relationship are endemic to the three basic frameworks or derive from particular theories within these paradigms.

In the third part of the book, the editors provide synthetic accounts of the development of comparative politics. Lichbach contrasts the three "research communities" by extracting the

basic ontological assumptions embedded in each paradigm, exemplified by representative works. Loosely inspired by Talcott Parsons's theory of social action, he then shows the complementarity of these approaches in a more comprehensive explanatory framework. Rather than validate the "messy center," Lichbach intends to contribute to "creative confrontations" among practitioners of different theoretical perspectives. He does not fully clarify the analytical foundations of the trichotomy of theoretical perspectives, however.

Following Parsons, one might see four rather than three alternatives. If the underlying dimensions of variance among paradigms are (1) different conceptions of human action (instrumental or expressive) and (2) different views of the constraining role of collective arrangements (individualist versus collectivist), four paradigms emerge: individual/instrumental (rational choice), collective/instrumental (structuralist), individual/expressive (symbolic interactionism, ethnomethodology), and collective/expressive (holistic cultural analysis). This fourfold typology brings the rival assumptions of different research traditions into sharper relief. It also signals the proximity of much rational choice and structuralist theorizing (pace Katznelson; both employ instrumental conceptions of human action but construct the tightness of constraints differently) as well as a critical ambiguity in the discussion of cultural perspectives, for example, in the Ross or Migdal essays. At times, they appear to waver between "individualist" or "collectivist" cultural analysis, although it is clear that the former is more prominent in the domain of sociology than of political science.

Alan Zuckerman's concluding essay has more an epistemological than an ontological or paradigmatic bent, although the author tends to identify a particular epistemological stance on the nature of theory and causation with rationalist and structuralist approaches. Zuckerman attacks the covering law model of theoretical explanation and associates it with a linear, causal, deterministic view of social science, intent on making point predictions and shunning "processes" in favor of "structures." His presentation of the positivist conviction, however, appears to fuse a large number of epistemological questions that are not necessarily linked. As reported by Levi (p. 20), some rational choice theorists subscribe to the covering law model without endorsing causal mechanisms. Furthermore, probabilistic, nonlinear law-like propositions that do not make point predictions are quite consistent with the covering law perspective. Finally, Zuckerman does not convincingly show me how a processoriented analysis could bracket questions of causality. Chaos and complexity theories are special cases of causal analysis. Despite these criticisms, Zuckerman's essay is a thought-provoking starting point for epistemological analysis in comparative

Overall, this book raises a large number of vital questions currently debated in the comparative politics literature. It should be obligatory reading for first-year graduate students in comparative politics. What Gary King, Robert Keohane, and Sidney Verba have done for comparative methods in *Designing Social Inquiry* (1994), the Lichbach and Zuckerman volume delivers for comparative politics theory.

For la Patria: Politics and the Armed Forces in Latin America. By Brian Loveman. Wilmington, DE: Scholarly Resources, 1999. 331p. \$60.00 cloth, \$23.95 paper.

J. Patrice McSherry, Long Island University-Brooklyn

Have military institutions in Latin America accepted subordination to civilian rule and shed their penchant for political intervention and coups? Brian Loveman presents a comprehensive picture of the Latin American armed forces in all their complexity and raises fundamental questions about the depth of change in military institutions and civil-military relations.

Loveman begins by posing several questions central to the analysis of civil-military relations and civilian control. Who decides, and through what procedures, what the armed forces' functions will be? When and how are their missions carried out? What is the relative autonomy of the armed forces on professional and institutional matters? What occurs when there are disagreements between and among military and civilian officials (p. xiii)? Most important, who decides when la Patria is threatened (p. xiv)? Loveman's main thesis is that military forces in Latin America's new (and renewed) democracies continue to be political actors whose subordination to civilian rule remains conditional. Within the "military lore" of the armed forces, he contends, the assumption persists that military commanders decide when threats exist and when intervention is warranted, as in the past (p. xiv). The notion of the military as guardian of the nation and the concept of "protected democracy" permeate the militaries, and many Latin American societies as well.

Loveman skillfully presents the complex historical and cultural traditions and influences that have shaped military institutions and their strategic doctrines. Although he is careful to point out the importance of national differences among, and institutional cleavages within, military institutions, he shows how and why armed forces throughout the region developed (and saw themselves) as supragovernmental tutelary elites (p. xx). The author examines the influences upon military forces from the arrival of the conquistadores, with their Iberian military tradition, to the present period of redemocratization. Rudimentary armies emerged during the wars of independence in the 1810s and 1820s and evolved during the era of the military caudillos. Territorial wars and political violence throughout the nineteenth century gave rise to nascent states as well as to militaries that disdained civilian politics and saw themselves as the repositories of national values. According to Loveman, "emergency powers and military ordinances against political opponents, 'subversives,' and bandits became routine" in nineteenth-century Spanish America, which provided a legal rationale for dictatorship and militarism that gradually came to pervade Latin America (p. 40).

Loveman traces the early origins of Cold War national security doctrines to turn-of-the-century Spanish, Prussian, and French military doctrines and attitudes imparted by foreign military professionals. These "modernizing" military trainers fostered "nationalistic, antipolitical, and quasi-religious military doctrines" that reinforced the militaries' view of themselves as saviors of the nation (p. 63). Latin American officers also became painfully aware of the economic and technological backwardness of their countries. Loveman examines variations on patriotic themes between the Depression and the Cold War, and he shows the growing influence in the region of the United States, which displaced European military missions in the 1940s. He documents the rise of Cold War national security doctrines that emphasized internal war, deepened the role of the militaries in politics, and encouraged a round of anticommunist and antipopular coups and repressive regimes from the 1960s to the 1980s. The legacies of this period were defeated leftist and progressive forces, weak constitutional institutions, eroded civil liberties, and thoroughly institutionalized military guardianship.

Loveman fully develops the core concept of "protected democracy" in chapter 7. He suggests that although political liberalization has occurred since the transitions from military

rule (as it did in other historical periods), human rights crimes remain unpunished, militaries retain political prerogatives and policymaking power, and military intelligence organizations continue to conduct surveillance of society. Everywhere, Loveman argues, even in countries where civilians have made notable progress in redemocratization (such as Argentina and Uruguay), military forces still regard themselves as the last bastion of defense and still possess "residual sovereignty" (p. 215, chart on pp. 218–20, 280–1). Moreover, constitutional and juridical bases for protected democracy remain strong.

The author is suggesting that scholars should be cautious about assuming that democracy is consolidated in Latin America (pp. xvi, 212-3, 221-2). When threats are latent or conflict levels are low, protected democracy operates, in appearance, virtually as a formal liberal democracy" (p. 222). Coups and military rule are the exception, not the rule; "protected democracy" means that militaries continue to monitor civilian politics for threats to the country and hold in reserve the prerogative to exercise tutelary powers. Loveman's analysis is a useful corrective to excessive reliance on assertions by military officers of their democratic fealty and subordination to civilians. Officers admit that they do not enjoy intervening in politics, which they consider a dirty business, Loveman argues, and they do not perceive military institutions as appropriate governing bodies. Nevertheless, when circumstances "force" them to assume their duty to save the homeland they have done so, and presumably they will do so in the future. Moreover, threats to la Patria are defined extremely broadly: they may be political or cultural, violent or nonviolent, foreign or domestic (pp. xiv-xvii, xxii–xxiv, 257–8, 272).

The work is readable and well-suited for advanced undergraduate and graduate courses as well as for the specialist in civil-military relations. Much more than a narrow study of these relations, the book is a broad historical account of Latin American politics since colonial times and the role of military institutions as central actors. It draws on a variety of primary documents, and its illustrations—photographs, cartoons, and charts—are a valuable feature. Loveman does not directly engage contending scholarly interpretations that posit the militaries have accepted subordination to civilian rule in the region. His arguments provide an important caution, however, against complacency regarding the democratic commitments of Latin American militaries. Persistent attitudes about guardianship and expansive military missions are incompatible with subordination to elected civilian officials (e.g., pp. 68, 280). Today, as armed forces in Latin America take on new missions in counterdrug operations, counterterrorism, "protection of democracy," environment and immigration control, development, and nation-building, it is a caution worth bearing in mind.

Making Race and Nation: A Comparison of the United States, South Africa, and Brazil. By Anthony W. Marx. Cambridge: Cambridge University Press, 1998. 408p. \$29.95.

Michael Mitchell, Arizona State University

Anthony Marx has produced an ambitious work. It poses significant questions about the manner in which the demarcations of race figure into the calculus of consolidating the power of states. How do racial dyads and triads develop in the process of state formation? Are racial coalitions the

manifestations of elites struggling to find formulas for the smooth consolidation of state power? In more specific terms, why did the United States and South Africa embark on adopting policies of extreme racial exclusion, while another multiracial society, Brazil, apparently did not?

For clues to the answers, Marx turns to the factor of elite cohesion, or the lack thereof. According to him, the greater the extent of intraelite rivalry prior to a critical point in the process of consolidating state power, the more likely is the possibility of elites relying on a consensus over the legal exclusion of a subordinate group to gain such cohesion. In this regard Marx makes a significant addition to the literature in which the state, its properties, and its evolution are of central concern. He makes the issue of race a major axis in the development of modern states.

Marx has marshaled an extensive body of literature to argue his case. In the process he shows an impressive command of his sources. To his credit he does not engage in ax grinding to demolish the work of other scholars. Instead, he weaves his critical commentary into a broader argument about the choices made in the purposeful inventing of racial orders that would serve the ends of making a modern state.

Marx organizes his discussion in the following fashion. In Part 1 he lays the groundwork for analyzing the evolution of racial hierarchies under states in the process of consolidating their national power. He demonstrates the surprising uniformity in the experiences of the three countries in creating a racial order in which people of African descent and indigenous Africans were subordinated to the power of colonial and semicolonial white elites.

Having established common patterns of racial dominance in the three cases, Marx turns in Part 2 to explaining why these countries took different paths in consolidating a state authority on the basis of race. In South Africa and the United States, previous intraracial elite rivalries were settled through a compromise in which elites acceded to imposing a rigid racial order that excluded blacks from full citizenship. In Brazil no compromise was necessary since, as Marx argues, a crucial regime transition (from empire to republic) was made with a more or less intact elite held together by a common purpose of preserving the structures of domination.

In Part 3 Marx deals with the responses to racial exclusion. Ironically, he argues, it was the very consolidation of state power in South Africa and the drive to resolve intraelite conflicts that sowed the seeds of insurgency. As the state was being consolidated along the narrow lines of Afrikaner nationalism and apartheid, the subjects of racial exclusion responded with calls to action. The interethnic rivalries among the indigenous Africans were attenuated by the increasingly wide net cast by apartheid policies over all South African blacks. In the United States, a crystalized racial consciousness was already in existence by the time, after Reconstruction, that the intraelite accommodations to racial exclusion were beginning to take form. This consciousness reached its peak in protest insurgency soon after World War II, when the consolidated state achieved its own heights of power. Leaders of the civil rights movement shrewdly perceived that a state flush from national victories over an economic depression and in a world war could be enlisted to reshape the bargain that had excluded them from national life. And, consistent with his previous assertions of Brazil's "exceptionality," Marx characterizes Afro-Brazilian protest against the racial order as having been muted by the general acceptance of the myth of racial democracy.

Any work that synthesizes such a large volume of material is bound to have loose ends. Several unresolved questions crop up in Marx's discussion of Brazilian "exceptionality."

His argument for this assertion rests on the contention that the Brazilian racial order evolved without resort to legal means because cohesive elites could impose a hegemonic ideology of racial democracy. Having done so, they effectively diminished the possibility of Afro-Brazilian contestation based on overt racial exclusion, as was the case in the United States and South Africa. This argument, which seems plausible at first glance, is grounded in some arguable generalizations. One concerns the extent of elite cohesion in Brazil. The signal event that occurred in the period Marx discusses was the Revolution of 1930, a regional revolt that soon took on national proportions. The ultimate consequence was destruction of the monopoly on power held by the elites in Brazil's two largest states (São Paulo and Minas Gerais) in favor of new national elites catapulted to power by Getúlio Vargas. The turmoil surrounding the Revolution of 1930 and Vargas's assumption of power suggests that, contrary to Marx's assertion, Brazilian elites failed to achieve a degree of cohesion that would have prevented successful insurgencies against the state.

Moreover, the manner in which Brazilian elites transformed the idea of racial democracy into a hegemonic ideology deserves further exploration. Racial democracy may not have been an historically constant view of society fully shared by Brazilian elites. During the First Republic (1889-1930) they were steeped in the ideology of scientific racism. When Gilberto Freyre published his view that Afro-Brazilian culture was an integral part of Brazilian national identity (Case Grande e Senzala, 1933, or The Masters and the Slaves), he was a maverick intellectual who was standing the scientific racists on their heads. Even though his notion of tolerant race relations gained acceptance rather quickly, the idea of racial democracy as a semiofficial state ideology surfaced in rather curious circumstances. Fernando Azevedo's voluminous work, A Cultura Brasileira (Brazilian Culture), published in 1941 as an introduction to the 1940 census, is generally regarded as a classic illustration of official adoption of the racial democracy idea. Yet, Azevedo's work appeared during Vargas's dictatorship (1937-45). How elites, who arguably controlled the apparatus of the state, could have pushed for a racial democracy when the regime of the time was engaged in the general repression of civil society is enough of a twist of ideology and practical circumstances to pique more than casual curiosity. The strange irony of racial democracy being promoted under a dictatorship calls for some explanation.

Still, a work should be judged on the basis of the overall plausibility of its arguments. In this regard Marx has set the terms of debate. The manner in which elites fashioned rules governing the relationship among racial and ethnic groups in the formation of the modern state will be the subject of further exploration and refinement. What Marx has accomplished is to move the subject of state consolidation in multiracial societies, and his insistence on the strategic importance of policies of racial exclusion, closer to the mainstream of contemporary comparative politics.

The Evolution of Inequality: War, State Survival, and Democracy in Comparative Perspective. By Manus Midlarsky. Stanford, CA: Stanford University Press, 1999. 349p. \$45.00.

Christian Davenport, University of Maryland-C.I.D.C.M.

Manus Midlarsky undertakes an ambitious effort to investigate the political implications of inequality (principally that concerned with land but other forms, such as wealth and income, as well). The book begins with the proposition that

inequalities evolve over time as well as space and that these patterns of distribution compel individuals to respond to them either with the development of particular sociopolitical arrangements or with their dissolution. Specifically, Midlarsky discusses two types of goods distribution: the "exponential" form, which assumes there is no difference between actors but merely fewer goods to go around within the context of some expanding society, and the "fractal" form, which assumes there is a difference among actors, and the very nature of the interaction results in the decreased availability of some good.

The bulk of the research explores the relevance of these distribution forms for numerous types of political behavior. To accomplish this task, Midlarsky draws upon a wide variety of historical cases and data sets. For example, to examine ancient state dissolution (chap. 4) he investigates Byzantium, China, the Maya, Ammon, Judah, Israel, Egypt, the Incas, and the Aztecs; to examine the influence of inequality on democratization (chaps. 5, 6, and 7) he investigates ancient Athens, Sumer, Mesoamerica, China, and Crete as well as a global database of 97 countries in 1980; and to examine the relationship between inequality and domestic violence (chap. 8) he investigates various Latin American countries in the 1950s and 1960s as well as African Americans during the period of "urban disorders." The research thus spans the breadth of human history as well as the social sciences. This combination of approaches (formal, qualitative/historical, and quantitative) and cases (across both time and space) is to be commended.

Perhaps one of the more interesting contributions of the book is the discussion of various theoretical paradoxes of inequality, democracy, and state survivability (chap. 10). Although there are five in total, two are particularly noteworthy. The first postulates that a certain amount of inequality seems to be necessary to prompt state development as well as democratization, but too much (especially sustained over time) can result in the destruction of political systems or autocratization. The fourth paradox suggests that although democracy is to a certain degree an internally based development, the process is subject to important "environmental" influences that can completely overwhelm domestic factors. These comments provide a very sober assessment of political change, for they force us to think carefully about the delicate balances that must be sustained in order to achieve as well as keep particular social arrangements intact over time.

Despite the numerous insights provided by the book, it has certain limitations—admittedly beyond the control of the author but relevant nonetheless. First, given the unbalanced nature of the social sciences, certain lines of inquiry are rather well developed in terms of operational definitions and evidence, whereas others are not. In the literature on "the state," for example, it is not clear whether one means the particular institutions affiliated with a commonly recognized governing authority, the size of these entities, the degree of attachment of the resident population to political institutions, or some combination of factors (e.g., Samuel Finer, The History of Government, 1997). The definition is important, for it directly influences the type of evidence needed to conduct and evaluate investigations of "state formation." Because these matters have not received enough attention, there is little guidance for researchers as well as readers.

Second, there appear to be no measures of inequality that can be used reliably and validly across time and space. This forces Midlarsky to be extremely creative (perhaps more so than any research effort thus far), but he occasionally pushes up against the limitations of reasonable data and causal inference. For example, in his discussion of inequality and

early state formation in Egypt, Midlarsky suggests that the evidence for stratification can be found within how individuals were buried at the time (p. 64). He concludes that communal graves indicate relative equality, whereas specially marked/designed or adorned graves indicate social stratification. These patterns are then used to explain state formation.

Different explanations for the special treatment of the dead are possible. A separate, adorned gravesite could indicate wealth (in line with Midlarsky's argument), or it could mean the deceased had lived a good life according to the cultural parameters of the society and was rewarded for this in the afterlife. If burial practices simply reflect the cultural belief system, then a materialistic conception of them would perhaps be inappropriate (Marimba Ani, Yurugu: An African-Centered Critique of European Cultural Thought and Behavior, 1994; Cheikh Anta Diop, Civilization and Barbarism: An Authentic Anthropology, 1991; and John Mbiti, African Religions and Philosophy, 1990).

The data and inference issues appear in various sections of the book. In Part 3, it is argued that democratic political systems emerge from one of three sequences. In the first (pp. 188-91), a certain degree of population density leads to land inequality, which in turn leads to an allocation of rights that reflects the differential effect of various groups/classes on society. In the second (pp. 191-2), land inequality leads to political violence, which in turn promotes democracy as elites attempt to pacify the insurgents. In the third sequence (pp. 192-3), density leads to land inequality, which leads to urbanization, which leads to economic development and, finally, democracy (rights merely represent the successful lobbying power of the now-conscious middle- and working-class coalition).

The models of sequences are tested empirically within the context of a cross-sectional examination of 97 countries in 1980. The principal reason given for the method is data availability, but it is problematic because it does not provide an adequate test of the various theoretical propositions (i.e., it does not allow the examination of sequential influences, thus capturing evolutionary dynamics). Rather, Midlarsky is forced to simplify theoretical models and extract causal inferences from what is described to be the end of a very fluid/complex developmental process. Again, one cannot fault Midlarsky, and his effort to overcome this limitation is both admirable and insightful.

One concludes the book with a sense of how Midlarsky must have wrestled with the sheer magnitude of the subject. Because of his efforts, the reader emerges with a general understanding of the significance of inequality for a variety of subjects that social scientists have considered throughout human existence but have not tied together very well (e.g., S. N. Eisenstadt, Political Sociology, 1971). This is one strength of the work, for it provides a framework for understanding the numerous intersections of inequality with politics. One also gains a strong sense that more attention needs to be given to the subject and that better measures need to be developed across time and space for the proper examination of causal dynamics. Perhaps another strength of the book is that Midlarsky explicitly identifies the varied manifestations of inequality (within different periods, contexts, and locales) and the places where we could possibly collect this informa-

It can only be hoped that inequality will be placed (back) on the agenda (funding for research and incorporation of the variable into the right-hand as well as left-hand side of causal models). This book should move us in that direction, for it reminds us that inequality has existed since the dawn of

human civilization and likely will be here as long as we are, influencing both our actions and our quality of life.

Electoral Systems and Democratization in Southern Africa. By Andrew Reynolds. Oxford: Oxford University Press, 1999. 341p. \$80.00.

John W. Harbeson, City University of New York

Andrew Reynolds makes a welcome and useful contribution to the literature of comparative politics from several perspectives. First, he offers systematic comparisons of the democratization experiences of five southern African countries at a time when intercontinental comparative studies are relatively rare. Second, he helps broaden the database of presumptively globally applicable theories of electoral systems and of constitutional systems appropriate to multiethnic/racial settings to be more inclusive of Africa. The African experience continues to remain grossly underrepresented in the empirical data upon which much of contemporary theory in comparative politics has been grounded. Third, the book presents carefully analyzed and quite rich comparative, empirical material on southern African democratization. Fourth, although not intended as a text, it would work well in upper-level undergraduate comparative politics courses because of its careful presentation of standard literature and the pros and cons of alternative constitutional and electoral systems.

Perhaps most important, Reynolds advances a potentially important modification of the well-regarded Lijphart theory on the structure and applicability of consociational political systems. His integrated, consensual, power-sharing formulation employs singular sub-Saharan African data both to illuminate a limitation of the Lijphart model and to offer a variant that may successfully address that limitation. The use of African data, which routinely is given short shrift in contemporary theory building, to improve upon that theory and truly globalize its foundations still remains a largely unexplored frontier.

Electoral Systems and Democratization in Southern Africa compares experience in Zimbabwe, Zambia, Malawi, Namibia, and South Africa. Arguing persuasively that those democracies that are most inclusive are most likely to become consolidated rather than metamorphosize into "delegative democracies" and worse, Reynolds finds within this set that those tending toward parliamentarism, proportional representation, and power sharing "provide the foundational level of inclusion needed by precariously divided societies to pull themselves out of the maelstrom of ethnic conflict and democratic instability" (p. 268). By contrast he finds what he considers to be strong evidence that "presidencies, plurality single member district electoral systems and majoritarianism combine to create the democratic cousin of Hobbes's allpowerful Leviathan state" and, he might have added, perhaps worse. The analysis lends theoretical support to an emerging consensus that, major problems notwithstanding, South Africa and Namibia are farther along the road to democratic consolidation within this group, Zimbabwe and Zambia are the most laggard, and Malawi is somewhere in the middle.

This conclusion leads to a problem, given the ten criteria employed by Lijphart to identify conditions favorable or unfavorable for consociational democracy. Reynolds's scoring suggests that, within this set, the countries least suited to consociational democracy are those that have progressed farthest toward democratic consolidation, and vice versa. His scoring for South Africa is less favorable than Lijphart's own, but only slightly so. But then Reynolds finds that South Africa

and Namibia have in fact begun to emerge as cases that suggest empirical support for a variant of consociationalism not emphasized in Lijphart's work: "inclusive power-sharing between all significant political forces but not ethnically based minority vetoes of segmental autonomy" (p. 106). Reynolds argues that this integrated, consensual, powersharing sets South Africa and Namibia, especially, apart from Lijphart's model and in fact suggests a creative elaboration of

Reynolds recognizes a limitation of Lijphart's model, namely, that a consociational democratic system may entrench the very ethnic autonomy it has been established to protect. Pursuing consensual governance without minority vetoes or segmental autonomy may escape this shortcoming and, he argues, in fact may be necessary when ethnic and racial identities are more fluid than the consociational model may assume. The evidence of such fluidity in electoral circumstances offered by Reynolds may confuse fluidity in ethnic identity with tactical dexterity. But there is a wealth of African evidence, in particular, on which he might have drawn more fully, that argues for the prevalence of just such fluidity in ethnic identity to a far more profound degree than Reynolds himself observes. Thus, his variant on Lijphartian consociationalism may be both necessary and already evolving in African circumstances as well as an enrichment of existing theory.

It does not detract from the value of the book to suggest that it has not definitively claimed the frontier upon which it has advanced. More scholars and more books are needed to explore and settle the issue for the academy. Reynolds is on solid ground in conceiving institutional engineering as an intervening variable between sets of socioeconomic conditions and given political outcomes. But broader historical forces, externalities, and characteristics of leaders and movements are among the other key variables also important in explaining democratic successes and shortcomings as well as institutional engineering. Democratic outcomes, or the lack of them, are the product of multifaceted historical processes as well as institutional interventions at particular junctures. This book does not necessarily settle the debate about the roles of race and ethnicity in postapartheid South African elections or those about the relative merits of proportional representation and parliamentary democracy versus their opposites in southern Africa or elsewhere. But the book is an important contribution to these debates as well as to those on still larger issues.

The important point is that Reynolds helps bring home to the political science profession as a whole a reality still underrecognized in some circles: The supposed separation of "area studies" from the fields of comparative politics and international relations has long been an inhibiting and destructive myth. In fact, the comparative study of politics within underdeveloped regions of the world continues to be an important contributor to the formulation and testing of theory in these fields.

Behind East Asian Growth: The Political and Social Foundations of Prosperity. Edited by Henry S. Rowen. London: Routledge, 1998. 358p. \$90.00 cloth, \$24.95 paper.

Gregory W. Noble, Australian National University

For the last two decades East Asia has dominated international debates about the political economy of growth. In the 1980s statists and neoclassical economists competed to claim credit for the combination of rapid economic growth with egalitarian distribution of income attained by Japan and the

newly industrializing countries of East Asia. In the early 1990s the spread of growth to China and the larger countries of Southeast Asia spurred scholars and policy analysts to devise hybrid models capable of comprehending the wide range of experiences in East Asia. Behind East Asian Growth is a significant attempt to decipher the secrets of success. Despite its ambition and its publication date, however, the volume gives little hint that the East Asian model of development may be problematic and makes virtually no reference to the dramatic financial crisis that erupted in 1997.

Edited volumes are often criticized for lacking focus, but this one is more schizophrenic than scattered. The first three chapters present a unified model of development that is often cast in doubt by the later chapters. The introductory chapters avoid traditional debates over trade, industrial, and financial policies on the grounds that a wide range of approaches have proved successful in East Asia. Instead, the authors propose a four-part framework based loosely on Douglass North's institutional approach to economic history, with emphasis on limiting government intervention and predation. The first element is effective governance, particularly protection of private property rights (although the authors make an interesting exception for one-off land reforms) and close government-business communications, which they claim limit predation. The second is the creation of achieving and learning societies, including the attainment of universal primary schooling before significant public resources are devoted to university education and a vague notion that policymakers should learn from their mistakes. Equality of opportunity rather than redistribution comes third, followed by external influences, in the Asian case primarily the bracing effects of communist threats, along with positive models and influences provided by Japan and the United States.

The effort to create a single Asian model is not entirely convincing. The volume is a clear example of selecting on the dependent variable: Comparisons to less successful cases in Asia and elsewhere are few and ad hoc. The Philippines occasionally appears as a counterexample, but no chapter examines it in detail, although that country weathered the financial crisis better than many others in Asia. Moreover, the volume makes surprisingly little effort to operationalize and test contentions, much less compare them with competing hypotheses. The discussion of government-business advisory councils, for example, greatly exaggerates their importance in Korea and Taiwan. The authors seem unaware of the pervasive complaints in Japan that advisory councils serve as manipulative "magic cloaks" under cover of which bureaucrats pursue their own interventionist agendas and are routinely used to sustain cartel-like arrangements.

Similarly, the book makes no attempt to quantify or test the argument that differences in protection of property rights explain divergences in private investment and thus economic growth. While the link between property rights and investment may explain extreme cases, such as the transition from feudalism to capitalism or the deleterious effects on private investment of massive and uncompensated confiscations, it is less obvious that it can explain variation in economic performance across countries in which basic property rights are

reasonably well protected.

The volume also does not enter the thorny thickets surrounding intellectual property rights, whose protection has hardly been a hallmark in East Asia. Empirically, the proposition is questionable, as the Korean case makes clear. After the coup of the early 1960s the new Park administration immediately pressured large capitalists to confess to improper activities and "donate" part of their wealth to the government. In the early 1980s, when recession led to massive overcapacity in the automobile industry, the government forced some producers to exit and others to reduce the number of models and engine sizes. Only after seven years of controls helped the industry attain economies of scale and international competitiveness did the government lift restrictions and effectively restore property rights. Similarly, since the recent financial crisis the government has exerted great pressure on the chaebols to exchange many of their major assets to boost economies of scale.

Despite periodic infringements on property rights, Korea has maintained one of the highest rates of investment and economic growth in the world. This should not come as a surprise. Investors seek to maximize not stability of property rights but profitability discounted by risk, and instability of property rights is only one possible source of risk. In the take-off stages of economic development, growth and profitability tend to be high. This leaves governments plenty of room to intervene without scaring off investment, as long as the interventions are reasonably effective, as they were in Korea.

The generally even distribution of income in East Asia appears to support the argument that equality dampens demand for government intervention and thus promotes economic growth, but the chart belatedly introduced on pages 310–1 demonstrates that economic inequality is pronounced even in some successful Asian countries, including Thailand and Malaysia, whose governments have implemented an aggressive policy of ethnic affirmative action. Even when measures of equality look fairly good, it is not always clear that the causal logic holds. In Korea and Taiwan income distribution was not notably equal until export-led growth boosted the incomes of the poor, and in both Korea and Indonesia the popular discontent with the concentration of wealth in the hands of leading conglomerates is a major political force.

Three chapters examine external influences, but two are actually about Japan as model rather than influence. The chapter by Woo-Cumings demonstrates how nationalist ideologies, security threats, and U.S. influence caused some Asian governments to resist predation and take economic performance seriously, but much more could be said about American and Japanese policies as well as the influence of the World Bank and IMF.

Many of the substantive chapters contribute useful empirical material on a range of Asian successes, such as smooth demographic transitions, the alleviation of poverty in Indonesia, and technology promotion in Taiwan, without particularly substantiating the introductory arguments. Others, especially the strong chapters by Raphael and Rohlen on Japan as model and by Stevenson and Snodgrass on educational practices in Asia, implicitly or explicitly call into question the attempt to create a single, modified neoclassical model; it is suggested, instead, that we need to consider differences between northern and southeastern Asia as well as variation over time and industries. Similarly, the excellent chapter by Haggard suggests that superior economic outcomes stem from an "optimal distance" between government and business that only some Asian countries have maintained. His thumbnail sketches of regional countries not only illustrate the ways in which bureaucratic capacity intersects with party structure and private sector organization but also provide glimpses of the strains that led to the Asian financial crisis.

All in all, Behind East Asian Growth is a provocative effort with much useful material. It would have been stronger if it had more consistently followed Haggard's injunction to ex-

plore the variations in regime organization and support that mold economic policy.

Armed Struggle and the Search for State: The Palestinian National Movement, 1949–1993. By Yezid Sayigh. Oxford: Clarendon, 1997. 953p. \$99.00 cloth, \$39.95 paper.

Erika Alin, Hamline University

Yezid Sayigh provides the most comprehensive examination to date of the emergence and evolution of the Palestinian national movement. The book is meticulously researched, drawing extensively on Arab and Palestinian primary sources and hundreds of interviews with Palestinian political leaders and activists. A former adviser to the Palestinian delegation at the Madrid peace talks, Sayigh spent more than a decade researching and writing this detailed historical account of developments in the Palestinian national struggle, from the establishment of Israel in 1948 to the 1993 Oslo Accords.

The themes highlighted by Sayigh will come as no surprise to those familiar with the evolution of Palestinian nationalism. The book is organized into four sections, each corresponding to a major phase in the post-1948 Palestinian struggle. Events associated with each of these phases have been analyzed in previous works, but Armed Struggle provides an incredible wealth of factual information and insight unavailable in the literature. It is an authoritative work as well as an invaluable reference source for anyone interested in the history of the Palestinian national movement.

Armed struggle, Sayigh demonstrates, has shaped not only the goals and tactical choices of the Palestinian movement but also the development of Palestinian political institutions and social identity. External events, notably the establishment of Israel and the 1956, 1967, and 1973 Arab-Israeli wars, as well as domestic developments in countries such as Jordan and Lebanon, where the PLO had a heavy presence, have influenced and constrained Palestinians' political and military options. Yet, the development of the Palestinian national struggle is rooted not only in historical grievances and Palestinians' relations with regional and international actors but also in the particulars of individual leadership, social class, and political organization.

Sayigh provides extensive and detailed accounts of the ideological, tactical, and policy differences that have existed within and among Palestinian groups and the effect of these on the national movement. The disparate beliefs, motivations, and goals of Palestinian leaders have largely determined the character and strategic choices of the political organizations they have created, and the vast divergence of ideological orientations among Palestinian organizations has made for a complex and often contentious process of policy formulation that has, at times, sharply divided and constrained the national movement as a whole.

Following the 1948 war, ideologically oriented political parties began emerging primarily among the Palestinian middle class. Life in the refugee camps took on many of the traditional characteristics of pre-1948 Palestinian social and political organization, but increasing education and urbanization gradually created a new generation of nationalists. These young people joined the Ba'th and other pan-Arab ideological movements, but, as Sayigh argues, following the 1956 war they increasingly realized that "the real challenge lay... in responding to the absence of autonomous Palestinian organizations" (p. 83).

As organizations such as Fatch emerged on the scene during the 1950s and 1960s, differences erupted between them and the pan-Arabists as well as within their ranks over

ideological and tactical goals and priorities. Fatch members, for instance, were divided over the desirability and timing of initiating an armed struggle against Israel and, following the 1967 Arab defeat and Israeli occupation of the West Bank and Gaza, over whether a focused guerilla campaign or a mass popular mobilization initiative would best further the establishment of an "autonomous Palestinian entity" in the occupied territories. Ultimately, organizational weakness, lack of popular organizing, and Israeli repression compelled Fatch to focus on building up its military and political base in neighboring states, which contributed to its subsequent involvement in domestic political conflicts in Jordan and Lebanon

A constant theme in Sayigh's analysis is the historical struggle Palestinian organizations have confronted in asserting an autonomous decision-making authority vis-à-vis prominent Arab states and leaders. Following the 1967 war, Fatch "perceived a near-miraculous opportunity to escape Arab control" (p. 154) and experienced, along with several other Palestinian groups, a revolutionary period of heightened military initiative and assertiveness. This period was shortlived, however, as Arab states proved unwilling to countenance an aggressive Palestinian presence within their borders and grew increasingly weary of future military engagement with Israel. By the mid-1970s the PLO, fearful of being excluded from regional and international diplomatic initiatives, was following the political lead of Arab states that appeared increasingly reconciled to seeking a diplomatic settlement of the conflict.

Sayigh's thesis affirms the centrality of armed struggle in defining Palestinian political identity, but it also clearly indicates the seriousness with which Palestinian leaders pursued the institutional and state-building project, first in Jordan, then in Lebanon, and finally in the West Bank and Gaza. At the same time, the emergence of entrenched and often elitist political structures dominated by exiled Palestinians lies at the heart of the PLO's recent challenges in establishing an accountable and inclusive political entity in the West Bank and Gaza, which until the mid-1980s the organization had considered relatively marginal to the national struggle. Although Sayigh's account ends with the Oslo Accords, the historical analysis it provides will be of interest to those seeking to predict the course of Palestinian political and institutional development.

Armed Struggle is an unprecedented look at the complexities behind the political and military evolution of the Palestinian national movement. The strength of Sayigh's work is the wealth of information it offers on every facet of Palestinian politics as well as its extensive bibliography and source listings. Readers seeking a basic overview of the history of the Palestinian movement should probably look elsewhere. Armed Struggle is for those who want a complete behind-thescenes description of the details and events that account for the accomplishments and failures of one of the century's most vibrant and durable nationalist movements. It is a monumental and ground-breaking undertaking that will undoubtedly stand the test of time.

The Politics of Lawmaking in Post-Mao China: Institutions, Processes, and Democratic Prospects. By Murray Scot Tanner. Oxford: Oxford University Press, 1999. 286p. \$75.00.

Shiping Zheng, University of Vermont

Since the post-Mao reforms began in the late 1970s, law reforms, legal institutional development, and rising power of

the Chinese national legislature—the National People's Congress (NPC)—have attracted much attention from a younger generation of China scholars in the West. For political scientists, the key research questions are both empirical and theoretical. Can we demonstrate that significant changes have taken place in the politics of lawmaking within China's political system? If so, what political implications do these changes suggest, especially in terms of system transition and democratization? These are essentially the questions that Murray Scot Tanner addresses in *The Politics of Lawmaking in Post-Mao China*.

The book is divided into four parts. Chapter 2 examines the strengths and weaknesses of certain theoretical models (the command, leadership struggle, and organizational or bureaucratic politics models) that have affected China scholars' thinking about lawmaking and the NPC. Part II (chaps. 3-6) analyzes the changes in post-Mao China's lawmaking institutions—central party apparatus, the NPC, and the State Council. Part III (chaps. 7-8) presents detailed case studies of the 1986 Enterprise Bankruptcy Law and the 1988 State-Owned Industrial Enterprise Law. In the last chapter, Tanner discusses any effects that changing lawmaking politics and institutions might have upon China's prospects for democratization. The central argument is that lawmaking power in China has been decentralized since 1978, due to the erosion of party control over lawmaking and the corresponding rise of competing legislative bureaucracies within the State Council. its ministries, and the NPC. Consequently, what was a unified, tightly run, top-down process has become a fragmented, multistage, multiarena process that involves three lawmaking systems of different power bases and interests.

Tanner proves beyond doubt that something important has happened in post-Mao China's lawmaking politics and legislature. He further demonstrates that the NPC's institutional development and growing assertiveness have shown great survivability in the face of sudden shocks from leadership struggles and political campaigns. Yet, this is not the book's major contribution to scholarship. Since the early 1990s, there has been a growing literature on the politics of lawmaking and legislatures in post-Mao China, including Kevin O'Brien, Reform without Liberation: China's National People's Congress and the Politics of Institutional Change (1990); Pitman Potter, ed., Domestic Law Reforms in Post-Mao China (1994), Stanley Lubman, ed., China's Legal Reforms (1996), and Lubman's Bird in a Cage: Legal Reform in China after Mao (1999). Although no one should expect Tanner to include studies published after 1996, it is fair to point out that his book is not the only one or the first on the politics of lawmaking and the legislature in post-Mao China. In this sense, Tanner overstates his case when he criticizes political scientists and Sinologists for ignoring the topic (pp. 6-7). This book's major contribution is that it offers a comprehensive and finely grained analysis. It is one of the best institutional analyses of the lawmaking systems not only in the party center and NPC but also in the State Council and its ministries. Tanner's two case studies also set a high standard. While the controversies surrounding these cases have been widely reported in the media in China and the West, Tanner's study is by far the most detailed and informative one.

In terms of theoretical analysis, the book is much less successful. The first problem is the description of the Chinese lawmaking process as "an organized anarchy." After finding serious problems with existing theoretical frameworks, Tanner concludes that the Chinese legislative system in many ways approximates an organized anarchy, suggested by the "Garbage Can model" (p. 34). Three defining features are unclear goal preferences, a decision-making system that lacks relatively clear rules and procedures, and key decision mak-

ers who are not all sustained or regular participants in the process (pp. 28-9). Tanner's two case studies add substance to the characterization of Chinese lawmaking as organized anarchy, but one wonders if the same could be said for the entire process of post-Mao reforms. Are there any issue areas and decision-making systems in China that the "Garbage Can model" cannot explain?

As if in anticipation of such criticism, Tanner suggests that the Chinese government's actions in Tiananmen Square in 1989 and the "one-child" policy are exceptions to an organized anarchy. These "brutally illustrate that, at least on some key issues, the senior Chinese leadership can reach a clear decision and arrange for it to be carried out" (p. 31). Yet, it could be argued that what happened in Tiananmen Square was precisely the result of an organized anarchy in that there were no clear goal preferences, no clear decisionmaking rules and procedures, and no key decision makers who were sustained or regular participants in the decisionmaking process. The implementation of the one-child policy also in many ways approximates the image of an organized anarchy. Would the politics of lawmaking look qualitatively different in different issue areas, such as criminal law, administrative law, national security law, or military and defense laws? This, of course, is beyond the scope of Tanner's book, but it points to the limitations of cases of economic laws in supporting "an organized anarchy" as a more accurate image of Chinese lawmaking systems and politics.

The second problem is that the author raises important theoretical questions in the book but largely fails to follow them through. For instance, Tanner first suggests that post-Mao Chinese lawmaking comprises five relatively distinctive stages: agenda setting, interagency review, top leadership decision making, NPC debate, and implementation. Later, however, he frankly (and admirably) admits that he lacks detailed data on two stages, top-level decision making and implementation, "which constitutes two of the most serious shortcomings in this study" (p. 209, n. 2). Early in the book (chap. 2), Tanner also offers the concept of "inadvertent transition" as a theoretical link between studies of policymaking and studies of system transition or democratization. But when he returns to this topic in chapter 10, what he discusses is "inadvertent transformation" within the system rather than system transition or democratization.

In short, of the three dimensions of lawmaking politics in China studied in this book—institutions, processes, and democratic aspects—the analysis turns out to be the strongest on institutions, weak on processes, and the weakest on democratic prospects.

Poverty and Inequality in Latin America. Edited by Victor E. Tokman and Guillermo O'Donnell. Notre Dame, IN: Notre Dame University Press, 1998. 245p. \$40.00.

James F. Petras, Binghamton University

As the title indicates, this collection of essays discusses the growing poverty and inequalities in Latin America from the vantage point of neostructural analysis. Accepting the basic tenets of free-market capitalism as inevitable or necessary, depending on the author, the contributors argue that there is a need for the return of a strong state as well as an increasing role for civil society, a competent social bureaucracy, and greater social expenditure directed at poverty alleviation, job creation and job training, tax reform, and education. Different authors look to different social-political actors to carry

out these changes. O'Donnell appeals to the democratic sensibilities of the privileged elites (p. 57) and what he calls the "middle sector of the middle sectors" (pp. 60, 61). Tokman looks to responsive governments and "empowering people" (p. 213), and Reilly identifies citizen action and NGOs (p. 174) as the change agents.

Both the diagnosis of the problems of poverty, equity, and social vulnerability and the proposals for new alternatives are all located within the ideological parameters of the globalization paradigm, which (for the authors) defines the terrain for debate.

The data presented on poverty and inequalities do not add much to what has been already published by international agencies and Latin American and U.S. scholars. What is problematical is the source of much of the data: Most are drawn from international agencies, which in turn rely on local government agencies, which have been notorious in inventing data to fit political ends. There is little independent data collection. The most basic problem is underreporting by the wealthiest groups. Today, the informal economy at the top is crucial in much if not all of Latin America, with income from the drug trade exceeding the legal exports of countries as diverse as Mexico, Peru, Bolivia, Paraguay, and, of course, Colombia. The result of unreported elite income is to magnify the degree of inequalities in countries such as Colombia. Because these essays accept and adapt to freemarket foundations as the basis of social policy, it is difficult to make sense of their claims to be creating a new development paradigm. There is a wide gap between the economic imperatives of the free market (and the neoliberal state that proposes and implements them) and the social reforms argued by the authors. Neither NGOs nor competent government agencies have demonstrated either the political or social capacity to bridge the gap.

Most authors propose measures that are compatible with the free market. Rene Cortazar argues for collective bargaining at the enterprise level, and Maria Antonia Gallant calls for more active participation of entrepreneurs and their enterprises in training and education. In Chile and elsewhere, enterprise-level collective bargaining has favored employers and weakened labor, leading to precisely the inequalities that the book purports to criticize. Increasing the role of business elites in the university will further reinforce their power to define socioeconomic agendas in their favor, which will reinforce cultural hegemony conducive to the reconcentration of income upward.

The descriptions of poverty are useful, but the explanations are weak and inadequate. For example, there is no mention of the military dictatorships linked to the big propertied groups that dismantled the social networks and reconcentrated income, and there is no analysis of how the transition to electoral politics was premised on continuities of the socioeconomic elites and the authoritarian military, intelligence, and judiciary systems. Apart from overlooking the historical events and deep structures, the authors fail to consider what Forbes describes as the flowering of a new class of Latin American billionaires ("The World's Richest People," Forbes, October 14, 1996, pp. 110-5), who have appropriated many of the privatized enterprises and who are centrally located to influence elected politicians and shape political agendas. What is more astonishing is the absence of any significant analysis of the role of international actors, multinational corporations, the International Monetary Fund, and so on, which have defined socioeconomic policies that have concentrated income, cut social programs, and increased inequality. To correlate poverty with education levels and other individual attributes is to overlook what

O'Donnell calls the "big picture," the deep structural links that have created an investor's and banker's paradise for the few and the growing inequities that the authors deplore.

The fundamental issues of poverty and inequality are located, as Adam Smith and a distinguished line of political economists since him have noted, in the concentration of state power and property—landed, industrial, and financial. This classical conception of inequality and poverty is indeed crucial for any attempt at reform mongering.

By ignoring the issues of concentrated power and property as sources of crises, the authors provide weak explanations of the economic boom and bust cycles that Latin America has experienced. For Tokman and others, the discussion of Latin America's "economic recovery" and "vulnerability" is largely a policy issue to be corrected. For O'Donnell it is inconceivable to move beyond the existing structures. He states: "So, what can be done? Not much I am afraid in terms of changing the overall situation, at least in the short and medium term" (p. 55). O'Donnell apparently overlooks the significant growth of antisystemic movements, such as the Rural Landless Workers Movement in Brazil, which has occupied large landed estates and settled almost 200,000 families through its direct action tactics; the Colombian Revolutionary Armed Forces, which are influential in more than half the municipalities of the country; and several other significant antisystemic sociopolitical groups. Whether or not the authors agree with the proposals of these movements, there is no basis for taking a position that deep structural changes are out of the question ("now-a-days nobody seriously believes in the possibility of a social revolution," p. 51).

Difficult issues are papered over in this discussion. For example, why has the advent of electoral regimes (what O'Donnell calls the democratic transition) deepened the vulnerability of countries, increased poverty in many countries, and widened inequalities? Why has poverty become chronic despite the proliferation of NGOs and the more than \$8 billion that has passed through their coffers? Can we continue to speak of "civil society," as Charles Reilly does, as a virtuous unitary entity in the face of deepening class divisions and inequalities? The civil society concept has very dubious analytical value in understanding contemporary social polarities. Billionaire owners of conglomerates and street vendors are both members of civil society. Do they have a common set of interests? What is absent is any serious discussion of class, gender, and race difference and conflicts that create and respond to inequalities. Diffuse occupational and income categories are largely descriptive. Correlations between personal attributes and collective social behavior are not causative explanations. Proposals for reform, some of which might provide temporary ameliorative balm to the pain of the many, are not linked to the real existing trade unions, peasant movements, and popular political parties that would put them into practice. The appeal, instead, is directed precisely to governments, entrepreneurs, and middle-sector groups who have over most of the past 20 years of electoral politics moved against redistributive politics.

Money Unmade: Barter and the Fate of Russian Capitalism. By David Woodruff. Ithaca, NY: Cornell University Press, 1999. 218p. \$29.95.

Juliet Johnson, Dartmouth College

Nothing demonstrates the importance of money like its absence. In this pathbreaking book, David Woodruff explains

why Russian enterprises, local governments, and finally the central government itself progressively substituted barter and monetary surrogates for formerly ruble-based economic transactions. In doing so, it challenges conventional thinking not only about the nature of postcommunist market transformations but also about the practice of state-building in the twentieth century.

Woodruff argues that we should study Russia's economic transformation through the "narrative frame" of monetary consolidation. In the process of monetary consolidation, a state asserts its sovereignty over society by centralizing control over the legitimate means of exchange. This gives a state the power to tax, exact seigniorage, and define the territorial limits of its fiscal authority. Political science suffers from a woeful dearth of research on monetary consolidation, and Woodruff's "sociological-institutional approach to money" ably engages and expands upon the work of scholars such as Polanyi, Simmel, Weber, and Knapp in weaving its theoretical web. In this view, money is an institution that finds its source of value in social conventions. Monetary consolidation, therefore, is a difficult political achievement that requires broadly based political support.

In convincingly explaining why Russia has failed so far in its attempts at monetary consolidation, Woodruff employs a truly impressive range of primary written sources and lengthy interviews with managers, bankers, and government officials from several Russian regions. Money Unmade first explores the evolution of the Soviet-era monetary and credit system in the 1920s and 1930s, then aptly demonstrates how the perpetual tension in the USSR between facilitating production and maintaining monetary stability, coupled with the development of "partitioned" money, structured the initial conflicts over monetary consolidation in the 1980s and 1990s without determining their outcomes. Gorbachev's partial decentralization of the economy under these institutional conditions led to rapid monetary expansion and repressed inflation. This trend, exacerbated by the battle for sovereignty between the center and the Russian Republic, encouraged an explosion of barter at the regional level and the strengthening of horizontal economic ties at the expense of vertical ones.

According to Woodruff, the subsequent battle for monetary consolidation in Russia took the form of center-regional conflicts over "legitimate" means of payment, with correspondingly weighty implications for Russian state-building efforts. If the central government could impose the ruble on the regions, then it would gain effective control over the state. If regional transactions permanently devolved into horizontal barter and giro networks, then regions would have little use for the vertical monetary interventions of the central government, and the Russian state would edge farther toward disintegration. At press time, the central government was losing this battle. Although the price liberalization of 1992 and the subsequent dismantling of certain Soviet-era payment mechanisms briefly reestablished the ruble as the preferred means of payment, barter and monetary surrogates had reappeared by 1994 and proliferated rapidly. Woodruff describes this as a "triple movement," borrowing and extending Polanyi's concept of the "double movement" whereby states simultaneously encourage the creation of all-encompassing, self-regulating markets while heavily intervening to buffer the catastrophic social consequences of unregulated capitalism. Although a short review cannot do justice to this complex argument, Woodruff demonstrates that a combination of Soviet-era economic legacies, the failure of the central government to build new administrative capacities, and the political and social imperatives facing local and regional governments forced the central government not only to

tolerate the emergence of barter and giro circuits but also to participate in them. As Woodruff observes, "in such subtle ways is sovereignty surrendered" (p. 147).

Money Unmade provides a timely and erudite corrective to two troubling theoretical trends in comparative politics. First, it demonstrates that the predominant narrative frame for studying postcommunist economic transformations, that of market reform, fatally obscures our understanding of the development process now taking place in Russia. Woodruff's approach reveals the emptiness of phrases such as "rentseeking," "corruption," and "reformers" when applied in the Russian context. Marketization advocates in Russia and the West (those concentrating on price liberalization, privatization, and stabilization) mistakenly thought that they were fighting the twentieth-century battle of the budget, when they were actually fighting the nineteenth-century battle for state control over money. As Woodruff notes, "that the emergence of barter in Russia came as such a surprise and appeared so absurd reflected a profound failure of historical perspective" (p. xii). The focus on monetary consolidation allows him to explain developments that have confounded those focused on market reform, such as the apparently erratic behavior of the Central Bank of Russia, the ultimate failure of shock therapy, and the reemergence of barter even as monetary stabilization took hold in 1994. These competing narrative frames also yield completely different policy prescriptions, inasmuch as monetary consolidation requires active efforts at state-building rather than mere economic decentralization. Moreover, by contesting the voluntarist vision of the state underpinning the market reform paradigm, Woodruff ultimately presents a fundamental critique of the way in which rational choice approaches have been used to evaluate postcommunist economic developments.

Second, Money Unmade occupies a refreshing middle ground in the ongoing debate between "transitologists" and 'area specialists" over the uniqueness of postcommunist transformations. On the one hand, Woodruff actively seeks comparable cases in the book's final chapter, relates the Russian case to familiar historical efforts at state-building and monetary consolidation, and seeks to make generalizable theoretical claims based on the Russian experience. On the other hand, he admits the difficulty of making accurate comparisons given the changed circumstances of states in the twentieth century and the unprecedented institutional legacies left by the command economy. Woodruff encourages us to evaluate postcommunist transformations on their own terms, investigating the evolving institutional development process without presuming to know the outcome ahead of time. As a result, Money Unmade affirms the vital importance of careful case study without retreating into disciplinary

Like most outstanding books, *Money Unmade* contains sins of omission rather than commission. In particular, Woodruff's decision not to address dollarization in Russia or the temporary persistence and subsequent breakup of the ruble zone seems strange for a book about monetary consolidation. Furthermore, his analysis of Russia's exploding nonmonetary economy cries out for a deeper investigation into the parallel monetary economy and for a more explicit look at the role of Western aid and advice in inadvertently facilitating the emergence of barter. These, however, are minor matters. This is simply the best book yet published on postcommunist political economy, and it demands a close and careful reading by any scholar interested in understanding this momentous era of institutional transformation.

Political Change in Eastern Europe since 1989: Prospects for Liberal Democracy and a Market Economy. By Robert Zuzowski. Westport, CT, and London: Praeger, 1998. 176p. \$57.95.

Bartlomiej Kaminski, University of Maryland, College Park

In five core chapters, preceded by an introduction and followed by concluding comments, the author restricts most of his analysis to three countries: Russia, Poland, and the Czech Republic. Each is given a separate chapter with catchy titles that summarize Zuzowski's assessments of developments there: "Carpetbaggers' Country" (Russia); "Spin-Doctors' State" (Poland), and "Czechs Are Different." The other two core chapters are a general review of transformation in Eastern Europe (chap. 2) and a Western approach to the region (chap. 6).

The author believes that a country's precommunist past determines its postcommunist future. Czechs had a working democracy and a relatively well-developed economy (more so than neighboring Austria) before World War II, and therefore they are different. The lack of democratic and market experience makes the task of establishing a market-based democracy difficult, if not impossible: "Czechoslovakia was the only democratic, industrialized country in Eastern Europe" (p. 2). Zuzowski is very optimistic about the Czechs but less so about the Poles and Russians (pp. 145-6). Poles had neither democracy nor a market economy, although some Westerners (not to mention Poles themselves) want to believe otherwise. Their success in conveying this image testifies to their ability to manage perceptions (hence they are spin doctors). Zuzowski argues that Russia has changed a lot over a very short time, but its further transformation hinges on people's tolerance of the pain inflicted and politicians' determination to "pursue revolutionary goals" (p. 65).

Equally crucial to the author's conclusions are his a priori assumptions about East European attitudes and behavioral patterns. These can be summarized as follows. First, "Eastern Europe is a 'street beggar' as a matter of choice, whether conscious of it or not" (p. 3). The implication is that there will be no sustainable economic growth in the region, and all assistance inevitably will be wasted. A beggar will go back to begging once he spends the money. Second, "most East Europeans have a poor perception, if any, of the link between private ownership and democracy" (p. 4). Therefore, external assistance should focus on education, whose task would be "to alter the traditional habits, beliefs, and activities that are inappropriate, ineffective, or counterproductive in attaining a sustainable democracy and a welfare state based on a market economy" (p. 129). Last but not least, Zuzowski believes East Europeans are devoid of ambition. "For many an East European success is tantamount to not being last" (p. 5). With such a huge baggage of behavioral liabilities, can they ever succeed? Zuzowski's optimism about the Czech Republic flies in the face of his assumptions, but he doubts whether that country should be regarded as part of Eastern Europe (pp. 114-5). After all, "the Czechs are more efficient or more pragmatic than the rest of the nations of the region" (p. 115).

But other nations differ as well. Hungarians are different from Poles, Estonians, Slovenians, and so on. Slovaks differ from Czecha, despite sharing the same interwar history. Yet, developments in these countries following the demise of communism have many features in common. All have parliamentary democracies (in contrast to former Soviet republics, excluding the Baltic states, which have presidential systems). They have successfully survived changes in power, thus demonstrating robustness of established institutions. Except for a rather unusual current arrangement between the oppo-

sition led by Klaus and the ruling coalition, which some describe as nondemocratic, there is nothing peculiar about the Czech political system in the context of other Central European countries. Using peaceful change in power as a result of elections and protection of human rights as criteria of consolidated democracy, the Czech Republic is neither worse or better off than nine other countries that signed the Europe Association Agreement (the Baltic states, Bulgaria, Hungary, Poland, Romania, Slovakia, and Slovenia).

Second, there is little if any evidence to support Zuzowski's claim that the Czech approach to economic reform has been "faster, more comprehensive, and ultimately more efficient than approaches taken in other countries of the region" (p. 114). The European Bank for Reconstruction and Development in its 1998 assessment of the progress achieved in establishing market-supporting institutions gives higher scores to Estonia, Hungary, and Poland than to the Czech Republic. It is among the most advanced group but is not a lonely leader, as the author would have us believe.

There is a serious failure in the Czech transformation that Zuzowski ignores. Economic crisis, which began in 1997, has proved that actions did not match free-market rhetoric. Klaus's policy of using state-controlled banks to provide soft credit to privatized large enterprises was "socialist." These de facto subsidies explain the short-lived (but much publicized) Czech miracle, that is, transition without substantial unemployment. The miracle has turned out to be a mirage.

Contrary to what Zuzowski claims, low unemployment was not the result of "the legitimacy and credibility of the Czech government" (p. 111); rather, it demonstrated the lack of microeconomic adjustment. Rapidly growing unemployment since 1996 and the current economic contraction prove that no transition economy can avoid pain when removing distortions inherited from central planning. The Czechs are not different in this respect.

Zuzowski claims that precommunist experience is important to understanding current developments, but this very experience during the interwar period distinguishes Central Europe—the term is not once mentioned in Zuzowski's book—from Russia, Belarus, or Ukraine. Why are European members of the Soviet bloc, including the Baltic states, parliamentary democracies, whereas other former Soviet republics have presidential systems? It may be that one must turn to history to explain it. But wherever one may look for an explanation, one has to notice that the transition paths of the two groups have been different.

The book is rich in generalizations. Some of them may be well taken, others may not. The problem is that careful examination of the evidence rarely supports the author's observations. Even when premises are revealed, their interpretation often misses the point. Richness and diversity in political and economic development in the former Soviet bloc in Europe deserve more sophisticated treatment than offered here.

International Relations

Asian Security Practice: Material and Ideational Influences.
Edited by Muthiah Alagappa. Stanford, CA: Stanford
University Press, 1998. 851p. \$75.00 cloth, \$29.95 paper.

Aaron L. Friedberg, Princeton University

The center of gravity of the international system has shifted in recent decades. In 1960, Asian countries produced only one-fifth of the world's goods and services, versus two-thirds for Europe and North America combined. Thirty years later Asia's share had grown to roughly one-third, while that of the Atlantic community had fallen to around one-half. Some time in the opening decades of the twenty-first century, these relative weights will likely be reversed.

Rapid economic change has been accompanied by a remarkable process of political evolution. After having first been dominated by outside imperial powers and then divided by the Cold War, Asia is finally emerging as a distinct regional state system, a cluster of strong, independent nation-states engaged in intensive and continuous economic, diplomatic, and strategic interaction. What will be the nature of the relations among the newly empowered nations of this increasingly important region? Will the international politics of Asia in the years immediately ahead be characterized more by rising levels of cooperation and stability or by intensifying competition and conflict?

Muthiah Alagappa's edited volume provides an invaluable source of information and insight for anyone wishing to wrestle with these large and urgent questions. To a degree that is unusual for collections of this kind, Alagappa has succeeded in orienting contributors toward a unifying concept ("security practice") and a common set of questions. How, he asks, do elites and central decision makers in various Asian countries think about security issues? Who or what do

they see themselves as trying to secure? What core values are they seeking to protect or enhance? What types of threats do they perceive? And how do they believe that they can best go about meeting them and achieving their objectives?

After setting the stage with a clear introduction, a useful review of recent theoretical debates on the concept of security, and an excellent historical overview of the international politics of Asia from the third century B.C. to the end of the Cold War, Alagappa turns the floor over to his colleagues. The essays explore the evolving security practices of the major Asian powers (China, India, and Japan) and the states of northeastern Asia (North Korea, South Korea, and Taiwan), southern Asia (Bangladesh, Pakistan, and Sri Lanka), continental southeastern Asia (Myanmar, Thailand, and Vietnam), and maritime southeastern Asia (Indonesia, Malaysia, the Philippines, and Singapore). These chapters are admirably rich in empirical detail, and their analytical quality is uniformly high. David Kang makes a persuasive case that there is method in the seeming madness of North Korea's menacing policies toward South Korea and the wider world. Roger Cliff traces the developments in Taiwan that have led in recent years to an intensification of its confrontation with the People's Republic of China. Samina Ahmed explains how Pakistan's precarious internal politics have influenced its policies toward India. It is a tribute to the authors that, in spite of the swiftness with which events have unfolded in Asia during the second half of the 1990s, none of the essays is badly dated or obviously obsolete.

In two concluding chapters, Alagappa attempts to identify, explain, and draw out the larger implications of the sixteen country case studies. He finds that, "unlike in Europe, there is little cause to argue that the state is in decline in Asia" (p. 613). To the contrary, "the state is the primary security referent for security decision makers," and "the nation-state is the most valued form of political organization in Asia" (pp.

612-3). In part because of their comparatively recent emergence from colonialism, Asian elites are preoccupied with internal security concerns (stemming largely from disputes over national identity and political legitimacy) as well as with external or international threats. "The interconnection of the concerns at the two levels is crucial to the understanding of a substantial part of the security behavior of Asian states" (p. 624). Given the multiple challenges with which they feel themselves to be faced, it is not surprising that Asian central decision makers are attracted to notions of "comprehensive security"; they are concerned not only with defending the international autonomy and territorial integrity of the nations they lead but also with preserving what they define as national unity, political stability, social harmony, and, in many cases, their own hold on power. Alagappa finds that Asian security practice is still dominated by self-help strategies, but he sees evidence of an increasing willingness to embrace notions of cooperative security and to explore the potential of multilateral mechanisms to build confidence and contain disputes. Finally, he points out that, "because nearly all Asian states are relatively new . . . and are still in the midst of fundamental transitions . . . and because the material and normative structures affecting them are changing too," their approaches to achieving security are very much in flux (p. 640).

Alagappa's analysis of these common features leads him to two important conclusions. He argues that the findings of the volume's contributors cannot be explained adequately without reference both to material and ideational factors. How leaders define their interests and where they perceive threats (still less how they devise strategies to deal with them) cannot be inferred simply by looking at "objective" factors. Alagappa describes his position as leaning toward constructivism. As he acknowledges, however, the recognition that ideas can play an important causal role is not damaging to realist theories of international politics in general (and especially not to realism's classical and neoclassical variants), only to the rarified and rather desiccated "structural" realism that held sway for a time in the 1970s and 1980s.

For Alagappa the fact that "international politics in Asia, especially during the Cold War, resembled that of the realist paradigm" is "not merely a product of anarchy or of the material structure. It is in considerable part an outcome of past and present ideas and interactions" (pp. 656-7). Things can change, they have begun to do so already, and Alagappa believes they are going to change even more in the future: "International politics in Asia is becoming less Hobbesian; principles and rules are gradually gaining in significance; state interaction is increasingly characterized by conflict as well as cooperation. Cooperation and learning... have contributed to a reconstitution of interests" (p. 660). Alagappa anticipates that "as the international politics of Asia becomes more multidimensional and complex, the realist paradigm will be increasingly inadequate" (p. 660). Perhaps, but the reader is entitled to be skeptical. It seems at least equally likely that lingering mistrust (between Japan and China, for example, or China and the United States, or India and Pakistan), domestic political processes, and shifting balances of power will propel Asia toward a new round of interstate rivalry made more intense, and perhaps more destructive, by the new-found capabilities of the countries of the region. If this happens, Asian political elites will surely revert to the full-blooded realist security practices that are, in most cases, very much a part of their historical traditions. Only time will tell.

Coercive Military Strategy. By Stephen Cimbala. College Station: Texas A&M University Press, 1998. 229p. \$39.95.

David P. Auerswald, George Washington University

Stephen Cimbala describes a world faced with low-intensity conflicts among subnational groups. In this world, the United States will increasingly be tempted to perform peacekeeping and peacemaking duties. Before intervening, however, the United States must develop effective coercive military strategies or risk repeated failure. In Cimbala's words, "mastery of the principles of military coercion is a necessary condition for success in war or diplomacy" (p. 3).

According to Cimbala, coercive military strategies combine the political and military uses of force. We normally think of the former as coercive diplomacy, or more specifically, its component parts: deterrence and compellence. The military use of force is normally thought of as any conventional military action whose goal is battlefield success. Cimbala argues that successful coercive military strategies combine the political and military uses of force in such a way as to ensure flexibility throughout a dispute, vary the pace of any escalation according to circumstances, and maintain domestic and allied political support.

The author then argues that the United States never articulated a coherent coercive military strategy during the Cold War. As examples, Cimbala provides chapter-length treatments of the Cuban missile crisis, the 1991 Gulf War, and the Vietnam conflict. The theme running through these chapters is that the United States failed to learn from past mistakes and instead spent most of the Cold War moving from crisis to crisis, refusing to adapt its coercive military strategy to emerging conditions. Vietnam is Cimbala's classic example of this phenomenon. Even such successes as the Cuban missile crisis and the 1991 Gulf War were qualified exceptions to the rule, caused more by inspirational leadership than by the steady accretion of experience.

Cimbala then discusses how the international environment has changed since the Cold War. He argues that civil wars and chaotic internal conflicts are becoming the norm. Collective security, which relies on knowing who is the aggressor (among other things), may thus be inappropriate for organizing future security arrangements. Operations short of war will also be increasingly difficult in the future, in large part because of growing U.S. domestic opposition to them. Given these trends, understanding the principles of successful coercive military strategy is even more important than it was during the Cold War.

The concluding chapter applies to the future the lessons learned from the Cold War, the American Revolution, and the Civil War. Cimbala argues that successful coercive military strategies have five characteristics: Influence the will of an opponent, maintain the flexibility to revise objectives as necessary, take the perspective of one's opponent before deciding on one's own actions, manipulate the symbols and information associated with a dispute, and maintain support for one's goal both at home and within one's military.

This is an ambitious attempt to broaden the definition of international coercion as more than just coercive diplomacy and to apply that model to emerging international circumstances. To get the most out of this book, however, readers might best be served by first reading the introduction and conclusion and only then turning to the empirical chapters. The reason is that each chapter highlights one or two of the characteristics of successful coercion listed in the conclusions. Putting each chapter into context is thus greatly facilitated by the conclusion's theoretical framework. For instance, one might be tempted to discount a number of

seemingly tangential discussions in the case studies, yet they further our understanding of those cases once their links to the author's overarching theoretical framework are made clear in the conclusions.

Coercive Military Strategy could stimulate a number of creative investigations. Future research, using a larger sample size, might help assess what combination of Cimbala's five characteristics of coercion are necessary for success, or whether a critical mass of one factor guarantees successful coercion. Such a project could demonstrate whether U.S. experiences in Cuba, the Gulf War, and Vietnam were representative of general patterns of U.S. coercion during the Cold War. An alternative approach might be to explore in detail a few U.S. cases involving the Soviet Union or its East European proxies. This is an attractive option given our recent access to Soviet-bloc archives. Using that material, researchers could examine the hypothesized linkages between U.S. actions and changes in an opponent's actual decision-making calculus, which the author was not able to do in the Vietnam or Gulf War cases.

How, then, should U.S. officials adapt policy to ensure future success? Cimbala repeatedly advocates the threat or use of sudden, overwhelming firepower to convince an opponent to capitulate, presumably because overwhelming force contributes to many of the characteristics Cimbala believes lead to successful coercion. This may be sound doctrine, but it may not always be necessary for success. Consider recent events in Kosovo, where NATO's gradually escalating air campaign, according to General Wesley Clark, SACEUR and commander of NATO forces, "was an effort to coerce, not seize." While there is no question that NATO strikes failed to prevent atrocities in the short-term, they arguably achieved NATO's broader goals of maintaining alliance cohesion and regional stability, providing the Kosovars with increased autonomy, and containing Serbia from further aggression.

Moreover, as the author seems to realize, and as the two recent Balkan conflicts demonstrate, overwhelming force may not be feasible when coercion requires maintaining consensus among coalition members. The alternative to multilateral efforts is for the United States to go it alone, but that is increasingly unlikely from a domestic perspective except in the most dure circumstances. One way out of this dilemma would be for the United States to cut back dramatically on its military engagements abroad. This sentiment will surely resonate in some quarters, but American leadership may suffer as a result. Cimbala certainly focuses needed attention on a problem confronting U.S. officials, but his book reinforces the notion that there are no easy solutions to the problem of future military threats and intervention.

The Myth of "Ethnic Conflict": Politics, Economics, and Cultural Violence. Edited by Beverly Crawford and Ronnie D. Lipschutz. Berkeley: University of California at Berkeley (International Area Studies), 1999. 580p. \$28.50.

David B. Carment, Carleton University

The chapters in this volume are drawn from the work of a study group on the political economy of "ethnic and sectarian" conflict organized by Beverly Crawford and Ronnie Lipschutz. The "myth of ethnic conflict" refers to the tautological nature of the term: The label "ethnic conflict" reveals very little about what underlies any conflict, and ethnic differences alone are insufficient to guarantee frustration, political mobilization, and rebellion.

The volume is built around two seminal essays, "The Causes of Cultural Conflict: An Institutional Approach," by

Crawford, and "Seeking a State of One's Own: An Analytical Framework for Assessing Ethnic and Sectarian Conflict," by Lipschutz. Theoretical analyses include "Ethnic Entrepreneurs in the Soviet Successor States," by Philip G. Roeder, "Fall of the First Russian Republic," by Michael Urban; and "Nationalism in the European Context," by Andrew V. Bell-Fialkoff and Andrei S. Markovits.

Complementary case studies provide an in-depth analysis of states and regions at various levels of democratic experimentation, liberalization, and ethnic conflict. There are eight such chapters: an investigation of identity politics in the former Yugoslavia, by Crawford; post-Soviet nationalism in Abkhazia and Ajaria, by Georgi M. Delruguian; "Islamist Responses to Globalization in Egypt, Malaysia and Algeria," by Paul M. Lubeck; "Ethnic Politics in India," by Nirvikar Singh; "Identity Politics in Germany," by John C. Leslie; "Cultural Conflict in the United States," by Lipschutz; "Interethnic Conflict in Great Britain," by Elaine Thomas; and "Identity Transformation in Bulgaria," by Maria Todorova. A summary chapter by Crawford completes the volume.

One risk in compiling an edited volume so broad in scope is that there will be too few conceptual and theoretical threads linking the chapters. The Myth of "Ethnic Conflict" makes an explicit effort to avoid this. The political economy explanation advanced in this volume is that ethnic mobilization is a function of a blend of structural factors (the relative size and location of ethnic groups), ethnic entrepreneurs (the role of elites who have a vested interest in advancing particular agendas), and normative determinants (an appreciation for institutionalized forms of conflict resolution as opposed to coercive measures). The essential argument is that ethnic entrepreneurs who can offer tangible resources to disadvantaged populations are most likely to gain political support. The level of resources available to entrepreneurs is dependent on "(1) the degree to which cultural criteria were historically used to allocate these resources ... and (2) the level of resources provided by international alliances" (p. 36).

The contributors also argue that a state's legitimacy is closely tied to the kinds of ethnic policies it pursues. Narrow policies are usually perceived as less tenable than broad distributive ones. In the absence of strong secular organized parties and strong institutional structures, ideology and culture become the focus for understanding entrepreneurial behavior. In some cases the state does not merely respond to crises, produced by uneven ethnic mobilization and social change, but is itself the dominating force providing differential advantages to regions and ethnic groups. In this case, conflict among elites emerges as a struggle over state power, specifically in newly emerging states. In other cases, when institutions are already weakened after decades of conflict and state suppression, the forces of globalization and liberalization act as catalysts for change by creating political space for ethnic entrepreneurs to emerge.

In the former and perhaps better understood pattern of behavior, conflict arises as a result of the breakdown of the central state, as traditional patterns of authority give way to regional and ethnic forms of political organization. In some cases the breakdown is temporary, although the transition is uncertain. The institutions most deeply affected are federal structures. Whereas power once flowed freely from the top down, there emerges a more narrow base of power controlled by dominant ethnic groups. This partnership is reinforced when the state is challenged by minority groups, itself a response generated by assimilative pressures, policies on in-migration, economic competition, and more direct political threats of secession. The net result is a lethal "policy feedback" process in which the central government's policies

in the form of entitlements for the majority ethnic groups induce minority groups to organize for political action. This challenge in turn generates greater resistance to change from the central state.

In the latter case, exogenous shocks, such as imperatives for rapid economic and political change in response to globalization and liberalization, create a somewhat different and less well understood dynamic. According to Crawford and Lipschutz, broken social contracts and weakened oppressive institutions open political space for ethnic entrepreneurs to mobilize support. If the resources made available to ethnic entrepreneurs are achieved through re-allocation or the disproportionate economic deprivation of one group in favor of another—a result of liberalization, for example—the net result will be the escalation of conflict toward intergroup violence.

The volume succeeds in two areas. First, it highlights the importance of understanding both proximate and underlying causes of conflict. In advancing this argument, the contributors suggest that, among other things, because ethnic conflicts have important regional and international effects, it is important to understand the dynamics of relations that arise as a result of ethnic alliance formation. Second, the volume advances basic understanding of when ethnic conflicts will become violent. Since a knowledge of causes does not necessarily help explain or predict when or how violent interactions will occur, the contributors argue that the probability of violence depends on the opportunities and constraints that present themselves to elites at any given time. Decisions to pursue violence cannot be understood except as part of some larger structural and normative framework. Options available to elites at any moment are constrained by available institutional capabilities and ethnic configurations. These capabilities are themselves a product of processes that occurred during some earlier phase.

Economic Interdependence in Ukrainian-Russian Relations. By Paul J. D'Anieri. Albany: State University of New York Press, 1999. 278p. \$24.95.

Yaroslav Bilinsky, University of Delaware

D'Anieri's monograph is an ambitious and, by and large, successful attempt to apply modern international relations theory to the obstreperous case of independent but vulnerable Ukraine. On the whole, it is well researched and documented, well organized, clearly written, and teachable in courses on the post–Soviet Union. But some lapses should be remedied in its second edition. I will note its flaws first, then pass on to its strengths.

On page 28 we read: "Overall, more than 70 percent of Ukrainians voted for independence [in the December 1, 1991, referendum]." On page 175: "A January 1995 survey reported that 64 percent of Ukrainians continued to support Ukrainian independence, significantly down from the 90 percent of 1991." The correct figure for December vote is 90.32% (Taras Kuzio and Andrew Wilson, Ukraine: Perestroika to Independence, 1994, Table 9.2, p. 189). The Soviet Union invaded Eastern Poland/Western Ukraine and Belarus on September 17, 1939 (p. 25). On September 28, 1939, Hitler's Germany and Stalin's USSR signed a supplementary agreement assigning Lithuania to the Soviet sphere of influence. The correct spelling of the last name of the Soviet general who tried to take over Ukraine for the August 1991 plotters is Varennikov (p. 155); and the correct spelling of Yavlinsky's first name is Grigory (p. 128). A Ukrainian speaker will notice three errors in the Ukrainian title used in

the motto on page 97: the correct title is "Dohovir Ukrainurospne i vona vzhe nikoly ne voskresne" (emphasis added; The [union] treaty will crucify Ukraine, and never will she be resurrected).

Those items are incorrect, and subject to debate are the comparisons of the former Soviet Union with the European Community (EC) and European Union (EU) that the author makes throughout the book, which some Russian politicians such as Grigory Yavlinsky also have made (i.e., in September 1991, Yavlinsky, who has proved a singularly ineffectual Russian political leader, wrote a plan for an economic union based on the European Community's 1957 Treaty of Rome). Russia is in Eurasia, not Europe. After Chechnya I, which cost a minimum of 70,000 deaths (to use the lower estimate of General Aleksander Lebed) and a maximum of 100,000 (according to Dr. Yelena Bonner), and after Chechnya II, which is proceeding as this review is being written, Russia may find it hard to enter some European institutions.

D'Anieri correctly takes quite seriously Russia's Council on Defense and Foreign Policy protoimperial integration plans of April-May 1996 (pp. 7, 202). Later (p. 218) he admits that unlike the EC/EU vis-à-vis the new Germany, the CIS, given the intentions of Russian leaders and the disparity in power among its members, can easily become an instrument for the restoration of the old authoritarian Russian empire. The best strategy for Ukraine, therefore, would not be to try to contain Russia by organizing a coalition of former Soviet states within CIS but to seek entry into EU and transatlantic security structures (NATO), along with Poland, the Czech Republic, and Hungary. But D'Anieri may be right that the bad performance of the Ukrainian economy and Ukrainian political weaknesses militate against achieving those goals in the very near future, unless the United States and European states realize the dangers from a resurgent Russia (p. 212). A Russia, we may add, that plays its own power game in Kosovo, Iran, and Iraq and effectively rewrites the terms of the IMF loans for its own benefit.

I agree with the author that the case of Russian-Ukrainian relations does not fit the liberal strands of hegemonic stability theory of international cooperation of Charles Kindleberger and Robert Keohane, more the realist strand of Stephen Krasner and Robert Gilpin (p. 218). D'Anieri has documented it amply in what is perhaps the best chapter in the book, that on the energy war of 1993–94 (pp. 69–96). The author imaginatively uses Albert Hirschman's analysis of Germany's economic warfare between the wars.

D'Anieri also tries to come to terms with the realist arguments of Kenneth Waltz, John J. Mearsheimer, and Barry Posen that to preserve its power Ukraine should have kept its nuclear weapons (p. 217). This he does less successfully. Chapter 7, "The Direct Economics-Security Connection: Nuclear Weapons in Ukraine" (pp. 147-67), is almost perfunctory. The author also asserts preemptively that the danger from Moscow was not military in nature but economic and political (p. 147). This may have been a rationalization of a faulty strategic decision by the United States and the other powers in NATO (Germany? Britain?) to disarm the strategic missiles deployed on Ukrainian soil and, above all, to press Ukraine to surrender its tactical nuclear weapons to Russia. This was done despite the warnings by Mearsheimer ("The Case for a Ukrainian Nuclear Deterrent," Foreign Affairs 72 [Summer 1993]: 50-66) and some of the authors in John W. R. Lepingwell, ed., RFE/RL Research Report 2 (no. 18), of February 19, 1993, which D'Anieri cites, and by William C. Martel and William T. Pendley, Nuclear Coexistence: Rethinking U.S. Policy to Promote Stability in an Era of Proliferation, 1994, which D'Anieri does not cite. As a result,

Russia still has about 7,000 strategic warheads threatening the United States, and there are about 40,000 tactical nuclear warheads, several thousand of which were yielded under U.S. pressure by Ukraine, that Russia is seriously contemplating using in Chechnya II and that are of very great concern to

D'Anieri partly makes up for his omissions in the security field by his wise general statement toward the end of the book: "Most important, in the former Soviet Union, most of the states are constantly concerned about their survival, and self-preservation preempts other goals. Realism pervades the politics of the former Soviet Union" (p. 222). According to him, Ukraine's glass may be half empty, but partly with belated Western aid, the country survived Russia's energy and political—war of 1993-94. Overall, this is a good, theoretically challenging, if somewhat uneven book.

Forging an Integrated Europe. Edited by Barry Eichengreen and Jeffry Frieden. Ann Arbor: University of Michigan Press, 1998. 340p. \$45.00.

Beth A. Simmons, University of California, Berkeley

In the 1990s, Europeans have had to address issues of deep integration that affect almost every social group to one degree or another. How are we to understand the forces and processes that will contribute to the further integration of Europe as well as those that threaten to undermine it? This volume is a collection of essays by political scientists and economists whose appreciation for interdisciplinary research has done much to develop a political-economic understanding of European integration. With very little editorial coercion toward a particular theme, the essays share an organic compatibility, perhaps because they developed out of a research colloquium on European integration that met over the course of the 1990s. The editors set the agenda by simply suggesting three issues central to European integration: economic and monetary union, the reform of political institutions, and the problem of enlargement. The autonomy apparent in each essay is a source of this volume's strength; there is no stretch to fulfill an editorially imposed mandate. Yet, taken collectively, the contributions shed a good deal of light on who participates in the European Monetary Union, the future membership of the European Union, and the problems associated with the future growth and development of this unique institution.

The first section addresses the EMU. In a stimulating article that blends economic theory with the constraints of domestic institutions, Geoffrey Garrett speculates about the likely membership in the EMU, using optimal currency area (OCA) theory as a point of departure. Is it possible to predict the likely members based on such a theory? Not entirely, Garrett concludes. In addition to the variables central to OCA theory (degree of economic integration, symmetry of economic shocks), joining a scheme for a common currency will only make sense if expected adjustments are small and if wage demands do not spiral out of control. Expect countries with independent central banks and centralized labor institutions to join the EMU, but do not look for Britain to join anytime soon. France's ardent commitment to membership is harder to explain in terms of probable macroeconomic consequences alone. France seems to have neither the economic prerequisites of OCA theory nor the institutions that Garrett argues render benefits to monetary union.

Christian de Boissieu and Jean Pisani-Ferry address the puzzle of French commitment to EMU. France, they argue, has long sought exchange rate stability, a preference unique

among G7 countries. The reason has not been to control inflation as an end in itself but to hold the exchange rate constant while disinflating as a way to remain competitive vis-à-vis Germany (p. 67). Despite the title of the chapter ("The Political Economy of French Economic Policy in the Perspective of EMU"), the answer is clearly grounded in international politics: "The political logic was that only a low-inflation, stable currency France could pretend to leadership in Europe" (p. 63). The authors maintain that French leaders did not view fixed exchange rates as a "commitment technology" to produce price stability, as is often thought; they saw it as a way to maintain the country's rank as a great power. If anything, the "political economy" of the situation is highly permissive: de Boissieu and Pisani-Ferry note that "there is no evidence of strong private sector preferences in favor or against EMU" (p. 82). In combination with an institutional configuration that favors foreign policy over economic policymaking (p. 64), it is not difficult to see why exchange rate policy has transcended political economy and become high politics in France.

The second section is devoted to "political institutions." Apparently not willing to sacrifice a good article for the sake of specificity, the editors have included three contributions that focus on both political and economic institutions, the former at both the European and the national level. Lisa Martin's chapter deals with the crucial question of the legitimacy of European institutions. She notes that once it may have been possible to think of European integration as an elite-driven process. But as European integration has come to affect important policy areas for more and more citizens, Martin notes that institutions are likely to suffer from a crisis of legitimacy for their lack of representation and accountability in decision-making processes. Interestingly, she believes the answer may not lie exclusively or even primarily in the reform of European institutions, and she gives an excellent account of why many of the so-called reforms of the European Council, Commission, and Parliament may not be as "democratic" as they are billed. And empowering the European Parliament may in the end prove incompatible with a "multi-speed" Europe. (The consequences of what institutional form this multispeed Europe takes are examined in the following chapter by Von Hagen and Fratianni.) The answer, Martin argues, is for national parliaments to heed the Danish example and more aggressively constrain negotiators in Council proceedings. This might lead to some inefficiency in reaching agreement, but the Danish record suggests it would improve efficiency with respect to the implementation of directives.

Michael Wallerstein's article points to the consequences of economic integration on the efficacy of an important domestic institution: the structure of industrial relations and wage setting in Europe. But not quite, since Wallerstein rejects any direct effect. Neither of the traditional arguments for integration's corrosive effects on centralized bargaining really hold water, he maintains. The notion that economic integration destroys monopoly labor's ability to raise wages is fallacious, since this has never been the strategy of encompassing labor institutions in Europe; they instead have negotiated reasonable packages of coordinated wage moderation. And the suggestion that integration has eroded the corporatist "bargain" of wage moderation in exchange for discretionary macroeconomic policies aimed at full employment is fallacious, Wallerstein argues, since whatever incentive unions have to solve their collective action problems continnes to be present even in the absence of such an active fiscal policy. Essentially, the correlation between integration and the decentralization of wage bargaining institutions is spurious. "The most compelling relationship between the decentralization of bargaining and economic integration may be that both are responses to a common problem, poor economic performance since the mid-1970s" (p. 203). This chapter has little directly to do with "Forging an Integrated Europe," but it does provide a sound antidote to alarmist claims that integration is to blame for the decay of wage setting institutions in Western Europe.

The final section addresses enlargement. Two chapters analyze the factors influencing support and opposition to joining the EU. Jonathon Moses and Anders Jenssen try to explain why Norway uniquely among the Nordic countries rejected membership, while Sven Arndt compares Austrian acceptance with Switzerland's decision to opt out. In the Nordic case, Moses and Jenssen hypothesize that attitudes toward the EU can be predicted by an entity's economic relationship with the EU. "The more economically integrated an entity is with the EU, the greater the likelihood that the entity [whether a country, county, or individual] will desire membership in the Union." They do not, however, make a traditional political economy argument. They maintain that "a sense of community may be formed by economic exchanges." Furthermore, "political integration might be built on the cognitive foundations of the interactive community" (p. 215). There is moderate support for the hypothesis, but there is none offered for the mechanism of "community." For example, although Norway was the only country to have all its top five export markets in the EU, it rejected membership. Moses and Jenssen attribute this to the specific nature of Norway's export economy, which is dominated by oil, but no reason is offered as to why a sense of community is stunted by the export of a black greasy substance. In fact, traditional arguments that have little to do with a "sense of community" or "cognitive foundations" are explicitly at play: "The specific nature of [Norway's] exports make it less susceptible to economic blackmail" (p. 221). Also, it is not easy to see what the individual data say about community or cognitive foundations: In each country these "show a very strong relationship between support for the EU and the likelihood that one's personal economy would be strengthened by EU membership" (p. 221). That sounds like a straightforward story based on economic interests of the narrowest sort.

Arndt comes to a somewhat different conclusion in comparing Austria and Switzerland. While a plethora of economic studies suggested both countries would face problems as a result of the Single European Act (SEA), these countries made opposite choices. Arndt attributes the difference in attitude to nonquantifiable considerations. In Austria, voters were concerned lest Austria be isolated from Europe and rendered unable to influence EU policy. In Switzerland, a tradition of neutrality, direct democracy, and concerns regarding sovereignty were nearly "insuperable" issues that tipped the balance away from membership. These factors may distinguish Austria from Switzerland, but the pattern of support within Switzerland, especially heavy cleavages along linguistic and urban-rural lines, may belie patterns of economic interest that the chapter does not discuss in any detail.

What of the eastern enlargement of the EU? Peter Boffnger points to tension in the prospects for eastern expansion. Yes, the EU would provide countries in Central Europe with an economic constitution that would help suppress the power of national producers and their demands for protection. The constraint, however, is the EU budget. The cost of providing benefits through the CAP and regional cohesion policies will be prohibitive and certainly will bump up against the willingness of largely German taxpayers to foot the bill. But, Bofinger argues, delay will only give the opportunity for

resistance to liberalization to grow in Central and Eastern Europe. In Olsonian fashion, the passage of time will allow special interests to organize to demand their share of rents from the state. Nationalism will only make resistance that much more difficult. Bofinger argues that the most prudent response would be to multilateralize the current agreements and enhance policy surveillance, while trying to ensure some degree of predictability for foreign direct investment. Institutions must be designed to consolidate the gains of liberalization without stretching EU resources to the political breaking point.

The editors have wisely let a talented group of scholars develop these themes without imposing an unnatural framework to the volume as a whole. The results overall justify this choice, although the cost is less dialogue among the contributors than might be useful. Even so, the essays make a valuable contribution to our understanding of the political economy of European integration. The combination of formal and informal argumentation, quantitative and qualitative evidence, and political and economic perspectives make a good case that there is much to gain from interdisciplinary study of the European Union.

Foreign Policy Decision-Making: A Qualitative and Quantitative Analysis of Political Argumentation. By Irmtraud Gallhofer and Willem Saris. Westport, CT: Praeger, 1996. 276p. \$69.95.

Collective Choice Processes: A Qualitative and Quantitative Analysis of Foreign Policy Decision-Making. By Irmtraud Gallhofer and Willem Saris. Westport, CT: Praeger, 1997. 212p. \$85.00 cloth, \$27.99 paper.

Rose McDermott, Cornell University

The thrill of decision making lies in the inherent freedom it allows to select preferred choices from among selected options. The agony of decision making derives from not knowing which option will most likely result in the desired goal. The challenge of decision making rests in the internal value trade-offs that must be made between valued alternatives. Analyzing these processes in a systematic way presents complications for any scholar who undertakes the formidable task of understanding the mechanisms by which decision makers make these choices.

Irmtraud Gallhofer and Willem Saris, two Dutch scholars, have produced two volumes that combine qualitative and quantitative approaches to the study of foreign policy decision making and collective choice. Gallhofer has conducted research on political decision making and textual analysis for more than two decades. Saris, a professor of statistics and methods at the University of Amsterdam, has worked on structural equation modeling and measurement procedures in the past. They combine a variety of methodological perspectives—archival research, quantitative analysis, and experimental design—to investigate the effect of various forms and combinations of political argumentation on foreign policy and collective decision making.

Foreign Policy Decision-Making analyzes individual decision making from a decision theoretic perspective. The authors examine the arguments used by individual leaders and politicians to convince their colleagues of particular positions on various issues. Collective Choice Processes seeks to examine the process that occurs when groups of decision makers combine to reach a collective choice. Each volume is divided into two parts, the qualitative analysis of cases and the quantitative analysis. Both books are extremely well

organized and provide useful summaries at the end of each chapter as well as each part.

In Part I of both volumes, the qualitative cases overlap, although the emphasis shifts from the more decision-theoretic approach of individual decision making in the former to the more game-theoretic strategic approach of collective choice in the latter. Both examine the following cases: the initiation of World War I in July 1914 by the Austro-Hungarian Common Council of Ministers; the initiation of World War II by Hitler's Germany; the Cuban Mission Crisis here labeled "the world at the brink of nuclear war" in October 1962; and the Dutch decision on whether to take measures against Indonesia in fall 1948. The collective choice volume also adds the Dutch cabinet's decision to carry out military action in Indonesia in December 1948. Through the parallel demonstration of theory across cases, the authors strive to document the operation of several specific hypotheses concerning the nature of argumentation and decision making. The similarity of cases is redundant if both volumes are studied, but the individual cases themselves provide thorough historical and archival documentation.

The quantitative analysis in both volumes examines different factors. Foreign Policy explores the nature of the decision rules used in political argumentation. The quality of the arguments as well as the factors in the specification of strategies, outcomes, and argumentation rules are analyzed. This volume also provides meticulous appendixes on the construction of decision trees, assessing intercoder reliability, and detecting decision rules from interview sources. An innovative method to determine whether decision rules are universal involves self-administered, computer-assisted interviewing, called tele-interview (p. 140). This procedure collected data from 59 Dutch subjects sampled at random. The quantitative analysis in Collective Choice examines the decision-making process and preference aggregation rules.

The results of these studies are interesting if not surprising. The findings from Foreign Policy teach the more systematic and consistent lessons. The authors uncover certain clear biases in the decision-making process across cases. This finding dovetails with established results from social psychological experiments on individual decision making and gains added credibility from this independent source of confirmation. These biases include the universal attempt to simplify the decision problem and the equally common avoidance of combining estimates of utility or probability with any kind of weighting measure of intensity. Indeed, this kind of simplification is one of the editing processes by which individuals frame the choices they later evaluate for decision-making purposes, according to Daniel Kahneman and Amos Tversky's prospect theory model ("Prospect Theory: An Analysis of Decision Under Risk," Econometrica 47 [1979]: 263-91).

Similarly, according to Gallhofer and Saris, decision makers strive to reduce uncertainty to certainty and seek to reduce complexity in any way possible, manifested especially in their desire to translate complex value choices into more simple ones. Kahneman and Tversky (1979) label the former tendency the certainty effect. In general, decision makers tend to restrict both the range of strategies and the number of consequences considered. This failure to examine multiple consequences simultaneously, often called nonconsequentialism in the economics and psychological literature, is pervasive because of the cognitive difficulty required in undertaking such complex considerations (Eldar Shaffr and Amos Tversky, "Thinking through Uncertainty: Nonconsequential Reasoning and Choice," Cognitive Psychology 24 [1992]: 449-74). Nonconsequentialism often results in magical thinking because leaders can only keep a few consequences in mind at a time; Gallhofer and Saris consistently find that the number of consequences typically considered is two and only rarely exceeds three. Because only a limited number of outcomes are considered, politicians come to believe that the consequences they want to have flow from a decision are the only ones possible. Undesired consequences are simply eliminated from contention by disregard. In this way, efforts to reduce cognitive complexity result in oversimplification, which can lead to disastrous results if no one considers important potential consequences, such as the outbreak of war.

The propensity to limit the universe of strategies and consequences contemplated often results in deferred decisions. According to Tversky and Shafir ("Choice under Conflict: The Dynamics of Deferred Decision," Psychological Reports 3 [November 1992]: 358-61), highly conflictual decisions are more likely to be deferred, and deferred decisions are more likely never to be made at all. Such avoidance results in a de facto return to the status quo, which everyone sought to avoid in the first place; indeed, dissatisfaction with the status quo typically instigates the decision-making process. As Gallhofer and Saris state, "political decision problems are in essence complex value problems with a large degree of uncertainty. Since these problems are so complex, decision-makers intuitively apply a variety of simplifications" (p. 124). Historical examples of the tendency toward simplification, provided in the qualitative cases, are often frightening in their horrific, or near horrific, results.

These volumes make real contributions to the study of foreign policy, collective decision making, and political argumentation, especially in the methodological realm. Many scholars pay lip service to the importance of combining methods to investigate and verify findings in political science, but few actually do so. The obvious reasons are the time and difficulty involved in becoming adept in a variety of approaches. Gallhofer and Saris genuinely strive to combine qualitative and quantitative methods to provide a wider body of evidence in support of their hypotheses. In attempting to appeal to the inclinations of all, however, they may end up alienating many. The qualitative cases are well-chosen and engaging examples, but the quantitative analysis and the emphasis on rules of argumentation or aggregation may prove too complex and specific for some to find useful. Although the qualitative analysis is well documented and organized, the format and findings are repetitive, and those with a penchant for quantitative work may find such demonstrations superfluous. This should not detract from the difficulty and complexity of clearly specifying hypotheses and testing them with a wide array of historical case examples as well as quantitative and experimental analysis. By and large, Gallhofer and Saris accomplish this task in a clear, thorough, and accessible manner.

Ironically, the main limitations of their approach may also result from some of this methodological specification. I will mention three issues in particular. First, the complexity of this analysis would require a great deal of time, energy, and resources in order to replicate or extend either the individual or collective set of findings. It is indeed an accomplishment that the authors were able to undertake such a comprehensive project successfully. This level of investment, however, raises the issue of generalization beyond mere replication. The authors freely admit that they seek to understand the decision-making features of politicians in the Western tradition. The all-too-brief extensions to other nations in the West at the end of *Collective Choice*, including Great Britain, France, Germany, and Belgium, do not allow us to extrapolate strong conclusions to the process of political argumen-

tation and decision making in the United States, much less in non-Western nations.

Second, these volumes provide some compelling evidence in support of specific biases in decision making and certain rules and procedures that govern these processes, but many critical questions lie outside the area of analysis. Most important, although the authors are willing to ask some hard questions about the nature of argumentation and the aggregation of preferences, no clear answers emerge about how or why a particular leader would choose one argumentation strategy over another in a particular instance. Obviously, this makes prediction difficult, and it leaves open on-going questions about the origins of such strategies and preferences. The search for specific decision rules or procedures in this manner is a bit reminiscent of the old studies in social psychology on the nature of persuasion, which systematically altered numerous characteristics of the environment, including the nature of the communicator, message, and audience, all to no systematic avail. It took the emergence of Leon Festinger's more unified theory of cognitive dissonance both to explain and predict the nature of persuasive communication in terms of motivation, not cognition.

Third, limits are imposed by a rigorous methodological design that focuses on some facets of the problem to the exclusion of others. Political argumentation, decision rules, and the aggregation of preferences, however important, do not constitute decision making writ large. It may be important to break decision making down into its constituent parts in order to examine various dimensions fully, but it is crucial to remember that the process as a whole is almost certainly greater than the sum of its components. As with motivation and the nature of persuasion, much of decision making may lie outside the realm of reason, in the domain of emotional conviction or moral passion.

Games Advisors Play: Foreign Policy in the Nixon and Carter Administrations. By Jean A. Garrison. College Station: Texas A & M University Press, 1999. 224p. \$34.95.

Karen M. Hult, Virginia Polytechnic Institute and State
University

When applied to foreign policymaking, "game" frequently signals either an elegant and stylized game-theoretic analysis of nation-states' bargaining strategies or the cynical conclusion of a world-weary journalist. Instead, Jean Garrison seeks to classify the varying "power games" (a term she borrows from Hedrick Smith) that senior foreign policy advisors play as they strive to influence U.S. presidents to adopt their preferred policies.

Games Advisors Play fails to breach the almost impregnable wall that continues to separate studies of presidential national security decision making from other kinds of policy decision making. Yet, it focuses on more than policy substance, drawing on the ideas of such scholars as Alexander George, Irving Janis, John French, and Bertram Raven. At the center of the analysis are three kinds of strategies on which senior advisors rely to move the process toward presidential acceptance of their preferred policies: control access ("structural maneuvers"), influence information flows ("procedural maneuvers"), and shape preferences and perceptions ("interpersonal maneuvers"). To illustrate the tactics associated with these strategies and to trace their effects on presidential decision making, Garrison uses four cases involving U.S.-Soviet arms control policy in the Nixon and Carter administrations. She compares the influence dynamics in the more closed Nixon advisory system to those in the

more open Carter system, highlighting the activities of national security advisors Henry Kissinger and Zbigniew Brzesinski.

Although the study uncovers relatively little new empirically, it brings together much diverse evidence from a range of archival, interview, and secondary sources. The work carefully and systematically traces presidential advisory processes as the United States and the USSR moved haltingly from the promise of SALT in the early 1970s, through the ill-considered "deep cuts proposal" of Carter's first year in office, to SALT II's ultimate demise in the U.S. Senate. In doing so, it makes a strong case for the need to pay attention to the influence of individual presidents, foreign policy advisors, and their interrelationships on specific decisions and policy outcomes.

The analysis is a useful example of the promise—and the complexities—of following the advice of Alexander George and Timothy McKeown to examine decision making with the "logic of 'process tracing'" ("Case Studies and Theories of Organizational Decision-Making," Advances in Information Process in Organizations 2 [1985]: 21–58). Quite clearly, this sort of rich description of how particular decision processes unfolded and who (if anyone) helped drive them can contribute to scholarly understanding and citizen assessment of policy decision making and public officials. Meanwhile, Garrison's inventory of influence tactics and her balanced judgments about their evident effect (on achievement of their wielders' policy goals, on other advisors' influence, on presidential policy decisions) provide important insights into the dynamics both of the cases she examines and of top-level U.S. policymaking more generally.

That said, the payoffs of the process tracing in Games Advisors Play might have been even greater if somewhat more attention had been paid to a handful of issues. As is the case in much of the decision-making literature, the conceptual grounding of the analysis could be clearer. For example, Garrison might have delineated more sharply the contours of advisory and decision processes and the distinctions between them. Similarly, she does not explicitly define the boundaries of presidential foreign policy "advisory systems." More important, the key features of such systems are described in varying ways: as "open," "collegial," and "competitive" (Carter) or as "closed" and "hierarchical" (Nixon). Yet, the degree of openness and the extent of hierarchy in these "organizational structures" (p. 144) would seem to be analytically distinct, if rarely orthogonal, dimensions.

In addition, case selection probably deserved more attention. Garrison notes, in a quite helpful if too brief Appendix, that the "foreign policy instances" she examined were "selected to have enough evidence available to illustrate the relationships among individuals and the group" (pp. 144–5). This strategy runs the risk of overstating the amount of advisor influence by excluding presidential advisory/decision processes that are less well documented or for which relevant materials remain closed. The potential selection bias is largely unavoidable, but perhaps it should have been acknowledged and its potential implications explored.

The causal inferences that one can draw from Games Advisors Play are quite limited, since the research design is "indeterminate" (in the terms of Gary King, Robert O. Keohane, and Sidney Verba, Designing Social Inquiry: Scientific Research in Qualitative Research, 1994). The "main differences" among the cases were "advisory structure" and "presidential leadership styles," as well as "the situation, the members of the inner circle, the time frame, and the political context" (p. 144).

The work also routinely notes apparent shortcomings in

each case it spotlights. Often the weakness is in the advisory process itself. Kissinger, for example, frequently insulated Nixon from diverse and conflicting advice, and the decision to propose deep weapons cuts to the Soviets early in Carter's term (in effect, undercutting the 1976 Vladivostok agreement) was reached without careful consideration of its possible risks. On other occasions, Garrison's assessment shifts to poor policy outcomes (such as the refusal of key U.S. senators to support SALT II). Only rarely, however, are the underlying criteria for these sorts of evaluations made explicit or justified.

A final issue is one that social scientists confront continuously. Should efforts focus on enriching empirical understanding by working, for example, to "identify other factors determining what, when, and how influence tactics are used" (p. 140)? Or are energies more fruitfully directed toward narrowing down the number of dimensions considered to a relative few? An approach like Garrison's promises rich and nuanced tales of advisor intrigue, policy complexity, and the volatility and uncertainty of decision making. At the same time, it complicates (and indeed challenges) attempts to generalize or prescribe. In doing so, it provokes and enhances the ongoing debate.

The Second Nuclear Age. By Colin S. Gray. Boulder, CO, and London: Lynne Rienner, 1999. 205p. \$45.00.

Gregory Paul Domin, Mercer University

Colin Gray's book returns nuclear weapons, as well as biological and chemical weapons, to center stage of world affairs. It shares in the tradition and arguments of Gray's other works (House of Cards: Why Arms Control Must Fail, 1992, and Modern Strategy, 1999). Gray, who teaches international politics and is director of the Centre for Security Studies, University of Hull, takes issue with the complacent attitude of American policymakers that weapons of mass destruction (WMD) no longer play a prominent role in world affairs. It is easy for Americans to become complacent: The Iron Curtain is down, NATO has expanded into Eastern Europe, and the economy continues to grow at unprecedented rates. Gray, however, cautions us that the spread of nuclear weapons (and the absence of a dominant political rivalry vis-à-vis the United States-Soviet Union) are still a problem and may ultimately destabilize the international system and lead to nuclear war.

The Second Nuclear Age (which is defined by the absence of a dominant political rivalry, bipolar or otherwise) is about the meaning of nuclear weapons for national and international security today and tomorrow. "The subject here is both the character of an emerging era and a requirement to define how particular kinds of menaces can be defeated, otherwise neutralized, or simply endured in tolerable terms. The problem is how to cope well enough with a persistently, albeit evolving, nuclear (chemical and biological) future" (p. 1). Gray argues that although the Cold War is over, the world may not be as safe a place in which to live. The good news is that the "first nuclear age" was defined by the bipolar struggle between the United States and the Soviet Union, but the bad news is that WMD still exist in this unipolar world and are still just as threatening today (p. 1).

Throughout the six chapters, Gray covers several themes. First, WMD are a permanent fact of life, whether it be the first, second, or tenth nuclear age. Now that the nuclear genie has been let out of the bottle, there is no turning back. The book is about the problems of coping with the largely unfamiliar challenge of a different—hence "second"—nu-

clear security environment from that in which today's policy-makers were educated strategically. Also, it centers around "the process of trying to cope with a new nuclear age when the conceptual, and much of the material, toolkit derives from a previous period" (p. 6).

Second, "the nuclear challenge to our security does not reduce to a simple menace, even though the eventual emergence of a third nuclear age characterized by a dominant axis of nuclear armed antagonism is likely" (p. 10). That is, there are more players on the world stage that possess nuclear weapons, or the threat of manufacturing them, than at any other time in history. As such, there are more threats to global security in this era than at any other time, which may ultimately destabilize the international system.

Third, although nuclear weapons certainly pose a risk to global security, biological, toxic, and chemical weapons pose a "growing array of threats that are in part at least distinctive in profile from nuclear menaces" (p. 6). Global security changes when these weapons can kill, in effect, millions of people. Such threats, obviously, need to be taken very seriously.

Fourth, the twin themes of "change and continuity" are examined. Continuity is used in the sense that there has been a transition from a first (bipolar) nuclear age to a second (unipolar) nuclear age to a possible third and fourth nuclear age. The discussion of such transitions is conducted against the backdrop of the "implementation of the major cumulative changes for security and strategy that are currently being effected by the arrival of new technologies" (p. 12). The theme of change and continuity may seem schizophrenic, but Gray argues that such a compound theme is not handled well by strategic theorists. He remains cautiously optimistic that this work may aid policymakers' understanding.

Fifth, "deterrence is unreliable" (p. 12). Gray goes to great lengths to argue that nuclear deterrence is inherently unreliable, but he does not argue that deterrence does not work. One need only revisit the roughly forty years of stability produced by the Cold War. Yet, although nuclear deterrence "worked" between the superpowers, it may not necessarily work between nonsuperpowers in the current period. Deterrence in theory is one thing, deterrence in practice is quite another.

Sixth, "among the themes explained in this work is the persistence of the distortion that the lenses of both political and strategic culture and national but parochial interest can wreak havoc upon strategic policy" (p. 12). The end of the Cold War meant the demise of a bipolar rivalry and one set of strategies and gave birth to the responsible state, as contrasted with the "rogue" (a state judged by us to be committed to overturn a settled framework of order that we regard as legitimate) (pp. 12-3), and a new set of strategies to deal with such states. Yet, the Cold War pitted one camp against another in clearly defined terms, but the present era does not offer policymakers such a luxury. Gray, quite correctly asks: What is a "responsible" state? What is a "rogue" state? The character of the second nuclear age is not shaped "solely by the negative attitudes toward nuclear armament dominant in an ever more I-war-minded US nuclear defense community" (p. 13). The post-Cold War period lacks the objectively, or at least the perceived objectivity, of its predecessor.

Finally, the "seventh theme is the Clausewitzian revelation that friction can rule" (p. 12). Gray argues that academics, policymakers, public officials, and the like are always tempted to draw tidy pictures of the future world stage and the solutions to its problems. Such naiveté fails to recognize that coping with a persistently nuclear future may indeed be

uncertain, frightening, and full of risks, that the future course of strategic planning may indeed contain some surprises that may or may not affect our national security. The bottom line is that there is no "one size fits all" solution to the problems of the second nuclear age.

Gray's work offers fascinating insight and information, but it has two major shortcomings, which the author freely admits throughout. First, the analysis relies quite a bit on speculation. Due to uncertainty, there "is no way I can demonstrate beyond reasonable doubt the superior merit in my understanding of behavior toward WMD that is prudent for the second nuclear age" (p. 43). Sadly, the arguments in this book do not rest upon any great conceptual or empirical discovery. They are without paradigm, much like the second nuclear age is without a rivalry.

Second, Gray admits to a preference "for a minimalist theory of world politics... this book is only a minimalist exercise in the theory of international relations" (p. 25). Such an approach is not useful in explaining conflict, particularly one that may be characterized by WMD, at the local and regional levels. In a world devoid of a bipolar rivalry, such conflicts will become the norm, and policymakers will need some place to turn in order to devise prudent strategies in order to address the problem.

Given these obvious shortcomings, Gray's work needs to be read by academics and policymakers alike, not so much for its theoretical insights as for the realization that WMD remain a threat to world security, even though the international stage, and its key players, have changed. The Second Nuclear Age is a good primer for reconsidering U.S. nuclear strategy. Its clear and relatively idiom-free prose makes it accessible to students interested in the threat of WMD in the post—Cold War era.

National Collective Identity: Social Constructs and International Systems. By Rodney Bruce Hall. New York: Columbia University Press, 1999. 392p. \$50.00 cloth, \$20.50 paper.

Mlada Bukovansky, Dartmouth College

International relations scholars with a social constructivist orientation have recently begun to produce empirical work substantiating more abstract formulations of the idea that, in the words of Alexander Wendt, "anarchy is what states make of it." Whereas initial empirical forays focused on relatively narrow cases, books offering more sweeping historical interpretations are now emerging; National Collective Identity is one of the latter.

Hall's core argument is that the patterns of international politics are fundamentally shaped by societal collective identities—how societies conceive of themselves as units. Who "we" are shapes how "we" interact. Societal collective identities vary over time, and such a variation in turn shapes political institutions, state interests, and the principles of interaction among actors in a given international system. Hall illustrates his argument with sketches of three distinct European international systems: the dynastic-sovereign system (which he dates from the Reformation to the Peace of Westphalia in 1648); the territorial-sovereign system (from 1648 until roughly the mid-nineteenth century); and the nation-state system (from the mid-nineteenth century until today). He maintains that each was constituted by different forms of collective identity, different notions of state interests, and different systemic principles of legitimacy. Against both classical and structural realism—the main theoretical foils—Hall argues that state interests are not gleaned as the result of some primal will to power or by assessing objective structural conditions. Rather, we must delve into how societies identify themselves as such, an enterprise that requires a foray into the cultural and ideological dimensions of social life, in order to understand state interests and patterns of conflict and cooperation in the international system.

Hall's general theoretical orientation is compelling; it echoes and dovetails nicely with the work of such constructivist scholars as Michael Barnett, Martha Finnemore, and Alexander Wendt. The distinctive character of this book lies in the execution of the argument and the sweeping historical illustrations mustered in support. Analyses of key historical episodes, including the Seven Years' War, the French Revolution, the rise of German nationalism, the character of nineteenth-century imperialism, and World War I, are used to buttress the argument. The emergence of nationalism and the nation-state system is the central empirical focus. There is much to admire in Hall's confident articulation of historical evidence to support his thesis. He also invokes an impressive army of important scholars from a variety of disciplinesincluding Liah Greenfield, Jürgen Habermas, Eric Hobsbawm, Henry Kissinger, and Michael Mann-to substantiate his theoretical and interpretive claims.

Throughout the book, Hall stresses the shortcomings of realist international relations theory. His substitution of the classical realist notion that state interests are derived from a "will to power" with his own notion that they are instead derived from a societal "will to manifest identity" is an original, if somewhat awkward and contestable, formulation. He also makes a compelling case that there is no underlying structural logic to anarchy and provides many examples of how much can ride on the form of collective identity that shapes a polity. But given the fact that some realists have written quite intelligently on the cases Hall covers, he should directly confront realist interpretations of those cases. The best of such confrontations is found in Hall's discussion of Barry Posen's work on the mass army (pp. 147-59); a few more respectful engagements such as this would have strengthened the theoretical effect of the book among the unconverted.

Hall's argument that changes in societal collective identity explain systemic changes raises some thorny theoretical questions. The most pressing is how a particular form of societal collective identity crystallizes. Hall's notion of collective identity comes close to serving as a catch-all category for any historical contingencies the author finds relevant for a particular case. He notes, for example, that "by a highly complex and historically contingent set of interactions, classes and nations emerged as dominant social actors in the nineteenth century" (p. 22). This gives him the freedom to tell a rich story about nationalism, but there is some sacrifice of conceptual rigor insofar as the forces that crystallized nationalism are "complex and historically contingent."

Furthermore, Hall's model lets him sidestep the collective action problem. It is, he argued, that collective identity produces collective action through socialization of individuals (pp. 37–8), but as rationalist accounts of collective action problems have shown, this proposition can be highly problematic. Just because there is a "we" in the world does not necessarily mean that "we" are going to do anything. Hall's "will to manifest identity" idea suggests that, once societies find their mode of collective identification, social action will follow automatically, but I remain skeptical. Overall, since so much rides on the notion of societal collective identity, it is troubling that the criteria by which we know a collective identity when we see it are poorly specified.

The elasticity of the concept also allows Hall to sidestep

important empirical issues. For example, he argues that he French Revolution generated a national collective identity (pp. 134-51) but neglects the counterrevolution that occurred throughout the period. Large portions of the French population continued to identify themselves in strongly local and particularly Catholic terms, and the aristocracy continued to put forth alternative conceptions of French identity, conceptions which saw a revival under Napoleon (who sought dynastic legitimacy by marrying an Austrian archduchess) and under the Restoration. Thus, collective identity can be contested (a fact that Hall acknowledges but does not pursue far enough), and it is an open question as to how one form as opposed to another becomes the dominant explanatory factor required by Hall's model. In short, the book makes a strong theoretical contribution to the conceptualization of the institutional and systemic consequences of collective identity, but it is less informative about how collective identities are determined or change. The latter issue is treated in a richly descriptive but not theoretically precise manner.

Along similar lines, the theoretical framework does not always generate a convincing explanation of why some systemic legitimacy principles become dominant over others. Presumably, systemic principles are derived from dominant forms of societal collective identity. I was confused to find that "Old Regime statesmen" (p. 269) still had a strong hand in running international affairs immediately before World War I, since Hall earlier stated that the Old Regime was dead and that national sovereignty had emerged victorious as a systemic legitimating principle. Also contestable is Hall's assertion that national self-determination emerged as the victorious principle in the Versailles settlement (p. 274), since its application was limited mostly to existing territorial entities, which suggests that territoriality was still firmly entrenched as a systemic principle. In fairness, Hall's understanding of history is sophisticated enough to recognize these tensions, but his theoretical model is too blunt an instrument to guide us in sorting them out. Closer attention to intellectual history and the ideological debates of the periods studied would yield further insight into how societal and systemic legitimating principles were articulated at particular times, which would then allow us to model tensions and variations in societal collective identity and systemic legitimacy more precisely.

Readers versed in the historical literature of any of the eras covered in this book will undoubtedly find things to quibble about in terms of interpretation, emphasis, and choice of sources. The writing style is somewhat bombastic at times and is peppered with colorful indictments of hapless aristocrats, incompetent Bourbons, and greedy capitalists. This can be lively or irritating, depending on one's disposition toward the targets. Readers without a solid background in social theory will find the theoretical chapters difficult going. None of the criticisms raised here should overshadow the fact that this is a major contribution to international relations scholarship. Hall has broken new ground in establishing the empirical credentials of constructivist approaches. His historical accounts resonate with compelling insights, and one can only hope that others will follow his pioneering lead.

Theories of International Regimes. By Andreas Hasenclever, Peter Mayer, and Volker Rittberger. New York: Cambridge University Press, 1997. 248p. \$59.95 cloth, \$18.95 paper.

Lisa L. Martin, Harvard University

As the authors explain in their acknowledgments, they began writing this book as a review article on modern theories of

international regimes and institutions. It grew well beyond the bounds of an article-length treatment of this vibrant area of study. The result is a comprehensive review of alternative approaches to studying regimes, one that should prove highly useful for teaching graduate seminars or for researchers who want a quick source on recent developments. In some ways, an article would have been more effective, as the luxury of pages allows the authors to draw distinctions that at times are too fine and to discuss at length less worthy contributions. Nevertheless, this is a valuable survey of the state of the field.

The analysis of international regimes is divided into three bodies of work: interest-based, power-based, and knowledgebased theories. Interest-based theories focus on problems of market failure or strategic dilemmas attached to particular issues in order to specify the role and influence of regimes. Power-based theories, which concentrate on problems of multiple equilibria, bargaining, and the threat of conflict, argue that power determines the choice of regime. Knowledge-based theories depart from or add to the rationalist assumptions of the other two approaches, according to the authors, to illuminate how ideas, persuasive arguments, and identities interact with regimes. The analysis of each approach focuses on its assumptions and internal logic rather than empirical studies of regimes. One of the most valuable contributions is the identification of logical problems within each approach, although serious logical inconsistencies are not always adequately distinguished from relatively minor problems of imprecision.

The primary value of this book is its thorough and detailed summary of existing approaches to the study of international regimes. Those familiar with the field may find that the summary of knowledge-based approaches contains the most new information. The authors distinguish between weak and strong versions of cognitivist theory. The weak perspective shares much with the interest-based and power-based approaches, such as the assumption of rationality and a positivist approach to designing research, but endeavors to add perceptions, ideas, and learning to the standard rationalist accounts. In this respect the potential for theoretical progress seems high, since rationalist models of incomplete information provide a central role for ideas and beliefs. Moving to a more careful analysis of the sources of such ideas and beliefs therefore requires no fundamental changes to the rationalist approach and could yield substantial new insights.

Strong cognitivists, in contrast, reject the assumption of rationality. They may see states as role-players rather than expected-utility maximizers, relying instead on a "logic of appropriateness" (p. 155). From this perspective, institutions do not merely regulate actors; they also constitute them. Strong cognitivists therefore focus on how institutions construct identities at a deep level. The discussion of strong cognitivism, however, reveals one weakness of the analysis. The difficulty is that rationalism and positivism are conflated. According to the authors, a strong cognitivist rejects both the assumption of rationality and positivism, but they suggest implicitly that the two are inseparable, or perhaps even identical. Yet, many analysts of identity in international relations—those who go by the label "constructivists"—are committed to challenging the rationality assumption while continuing to use a positivist approach to develop and test hypotheses. Similarly, it is possible to imagine the use of game-theoretic models to interpret behavior rather than as a source of testable hypotheses. Keeping rationalism and positivism distinct is essential to a clear analysis of alternative theories, and conflation of the two could lead to substantial confusion.

The original contribution to the study of regimes comes in

the final chapter, where the authors argue (somewhat tentatively) in favor of a synthetic approach, as opposed to continuing to sharpen differences among theories. Interest-based and power-based theories could be synthesized by using the analysis of power to make claims based on interests more contextual. Rationalism and weak cognitivism might be complements, with cognitivism providing some of the necessary inputs, such as preferences and beliefs, for a rationalist model. Rationalism and strong cognitivism, in contrast, show little potential for synthesis. This seems particularly true if the authors are correct that strong cognitivists reject positivism; not all of them do, however.

Few would deny that the clash of paradigms that has characterized much work on regimes has been less than fruitful. The desire for a synthetic approach is strong, and pluralism among those who study regimes is surely a good idea. Nevertheless, careful analysis of the underlying assumptions of alternative theories is necessary before making a firm commitment to synthesis. Theories that rest on incompatible underlying assumptions cannot productively be combined, as the authors acknowledge in their treatment of strong cognitivism. For example, interest-based and power-based theories both assume rationality, but beyond this common bond the assumptions often diverge significantly. Interest-based theories focus on the problem of incomplete information in international politics, the possibility of market failure that this introduces, and the role of regimes in enhancing transparency. Power-based theories, in contrast, see information as not very problematic. The role of regimes, therefore, is to institutionalize a particular pattern of behavior that works to the benefit of the most powerful state rather than to provide information. Any attempt to meld theories that have such radically different assumptions about information is as likely to lead to incoherence as to a unified, progressive body of

Studies of international institutions and regimes have flourished over the last two decades. Ongoing theoretical and empirical research, now reaching beyond international political economy into the study of international security and social issues, indicates that this agenda will continue to be productive. Differences in assumptions and implications of alternative theories are just now being specified in such a way that they can be directly tested. In this setting, the authors provide a good guide for those new to the field about where it now stands. Their agenda for future directions, which focuses on attempts to synthesize existing theories, is worthy of consideration but requires more skeptical analysis.

Identities in International Relations. Edited by Jill Krause and Neil Renwick. New York: St. Martin's, 1997. 220p. \$65.00.

Resolving Identity-Based Conflict in Nations, Organizations, and Communities. By Jay Rothman. San Francisco: Jossey-Bass, 1997. 195p. \$28.95.

Martin O. Heisler, University of Maryland

To say that these two books deal with identity tells very little about them. In the 1990s alone, literally thousands of books and a vast number of articles were published with such a focus in English alone. The term is common in the vocabularies not only of social scientists, psychoanalysts, and students of literature but also of political activists and politically and culturally engaged people in most of the West; and it is increasingly common in political and psychological discourse elsewhere. In addition to the myriad scholarly formulations of the term (is it a concept?), more and more people are

becoming conscious of "identity" in their lives, talking about it, and sometimes basing their actions on such consciousness. Each discipline, theoretical posture, political orientation, and cultural situation gives it a different twist; indeed, it would seem that each user can choose her or his meaning. Identity is essentially subjective, both as a phenomenon and as a concept, and, therefore, there are few criteria for judging the legitimacy of any particular usage. In sum, two facts about identity have become clear in recent years. First, it is increasingly prominent in academic work and general political and cultural discourse. Second, and not unrelated, it exemplifies conceptual stretching of the sort Giovanni Sartori cautioned about in this *Review* 30 years ago: Using it more and more widely leads to saying less and less with it.

But if the situation is serious, it is not hopeless. There is some intersubjective agreement on conceptual boundaries. A growing number of scholars have been meeting recently, in print if not in person, in diverse but overlapping circles of intellectual exchange. Conversations based on mutual understanding and even efforts to work cumulatively are increasingly evident. Some of this work, especially in international relations (IR), is empirically grounded or at least suggestively illustrated, notwithstanding the tendency of many writers to use postpositivist and/or postmodern language. The areas of overlap include emphases on the growing importance of collectivities based on ethnicity or nationality, religion, or other cultural or ascriptive traits in IR. Not all writers argue that the significance of states as actors in world politics is declining, but most accord them relatively less central roles.

Jay Rothman and the contributors to the volume edited by Jill Krause and Neil Renwick demonstrate ways identity can be harnessed for research and theory and, for Rothman, intervention in the "real world." In both books, identity denotes a collectivity or solidarity group. Such collectivities are treated most commonly as actors in politics; in much of Rothman's work and in all the essays in *Identities in International Relations*, these are actors in regional or general world politics and are seen as increasingly important challengers of the primacy of states as actors. The two books share the virtues of relative conceptual clarity, theoretical relevance, and connection to issues that matter for people, peace, and order, but they have little else in common. Their purposes and styles are fundamentally different, and they reflect very different ways of thinking.

The Rothman book is a graceful amalgam of his extensive and varied experience in conflict-management, theoretical consciousness, and personal values. He wants to advance prospects for cooperation and peace across a wide range of conflict-ridden situations, from small groups and localities to societies and international relations. Threats to identity are at the root of the general insecurities and hostility that energize parties to the most intractable conflicts. If the deep underlying elements in such conflicts can be identified and brought to the surface, then perhaps some of their elements can be harnessed for cooperation. Rothman plots the path to cooperation through what he terms "the ARIA framework": antagonism, resonance, invention, and action. He uses musical metaphors throughout and discusses the dynamics of his framework in terms of "the ARIA Quartet." (This often tedious, extended, and not always consistently used metaphor is one of two serious stylistic flaws in an otherwise wellpresented argument and well-written book. The other is a penchant for relegating important conceptual points and qualifications to endnotes.)

Rothman differentiates identity-based conflicts from those centered on resources and argues that such conflicts are not only very difficult to manage but also often difficult to recognize. They may be misdiagnosed as disputes over material or other issues. Identity revolves around concerns related to dignity, the need for recognition, opportunities for participation, and cultural distinctiveness. (He recognizes that this is a forced dichotomous distinction appropriate only for heuristic purposes.) Surfacing the roots of antagonisms beneath perceived threats to individual and collective concerns with identity is a crucial first step in the ARIA process. The next step involves "inventing" ways of transforming elements that have given rise to antagonism into cooperative dispositions. This is followed by the "reflexive reframing" of the conflict, so that "the identity needs of all sides" can be taken into account, leading to "resonance." Finally, once reframed, the conflict can be directly tackled through appropriate action. Facilitators are crucial at all stages but particularly in the invention phase.

All this may seem both commonsensical and very idealistic. But what Rothman is attempting to do, if I read him correctly, is to move confrontations to negotiations and negotiations to the explicit confrontation of conflicting cognitive and cultural perspectives. It is then that intelligent and well-meaning intervention (facilitation, rather than mediation) can manage conflicts. If there is a flaw in this strategy, it follows from an implicit assumption that what appears to be a logical progression from the first to the last A in the ARIA process can be translated into a progression in action. Like Marx's assumption that moving from class consciousness to class-based collective action is likely because it is logical, for Rothman the temptation to harness a compelling desire to manage conflict to lessons derived from some specific successes in conflict management to a general formula may well bump up against disconnections between intellectual awareness and practical calculations of interest. Unfortunately, it is hard to know under what conditions the ARIA process is likely to work or not.

The volume edited by Krause and Renwick is a coherent, harmonious collection that shares a theoretical focus but is remarkably varied in content and point of view. The focus is on identity at the level of nation. Beginning in the editors' introduction and evident in most of the ten chapters that follow, national identity is transmuted into, or used interchangeably with, nationalism. This would be a source of puzzlement or irritation were it not smartly made into a theoretical tool at the very outset. The argument begins with the problematization of society in an era of penetrated boundaries and globalization. If the boundaries of society and state can no longer be assumed to be coextensive, how do we find the body politic? Most of the contributors test one or another iteration of the notion that national identity and the bounding of the polity in national(istic?) terms is the emerging answer.

It is not possible to render the arguments of the contributors in a fair and discrete fashion in a brief review. The concerns with forms and meanings of large-scale identity in contemporary IR theory and practice are addressed in both general thematic chapters (e.g., the "inside/outside" divide, globalization, ethnicity, gender, and citizenship) and essays with specific area or regional focus (the Middle East, Nicaragua, Europe, sub-Saharan Africa). Every contribution tests fresh ideas about the identitive or ascriptive foundations of current or emerging polities. These are interesting and often provocative but seldom without difficulties. Most of the difficulties stem from the sometimes casual treatment of existing theoretical arguments. Thus, before we can demote the nation-state as an entity privileged in IR theory and practice and supplant or even supplement it with large-scale collectivities based on identity, we have to dismantle international law, organizations, and much else. And before we can put such collectivities on center stage, we have to come to grips with the manifest tendency of many or most of them to strive for nation-state or nation-state-like qualities.

Some normative and practical problems lurk beneath the surface of schema that rely on identity-based group actors. How is membership in the group determined? Who chooses its spokespersons or representatives? What, if any, opportunities do members have to exit? How and by whom is solidarity inside the group enforced? Such problems are endemic to institution-design approaches that rely on group actors based on collective identity or cultural affinity. Thus, the ARIA process may produce agreements, but the stability of those agreements may be jeopardized by divisions inside the group actors. This has clearly been the case in the "settlements" reached in the 1990s in the Palestinian-Israeli, Northern Ireland, and Basque conflicts. In each instance, (predictable) divisions inside one or more of the parties challenged the legitimacy not only of the outcome but also of the process by which it was achieved and, in some cases, the legitimacy of those who bargained on behalf of-in the name of—the collectivity. These concerns are also apposite for the identity-based solidarity contemplated by the contributors to Identities in International Relations.

On balance, these are both worthwhile contributions to the growing literature on cultural and identitive aspects of IR. They are thoughtful, informative, readable, and, perhaps most valuable, arguable.

International Relations in a Constructed World. Edited by Vendulka Kubálková, Nicholas Onuf, and Paul Kowert. Armonk, NY: M.E. Sharpe, 1998. 214p. \$59.95 cloth, \$25.95 paper.

Mark Peceny, University of New Mexico

A decade ago, Nicholas Onuf introduced constructivism to the international relations field in his path-breaking book, World of Our Making (1989). Since then, constructivism has established itself as a serious challenger to the rationalist approaches that dominate the discipline. Many scholars have traveled the constructivist path in recent years, but they have not followed the specific trail cleared by Onuf. International Relations in a Constructed World attempts to place Onuf's vision at the center of the disciplinary debate by making it more accessible, situating it as an approach that avoids the extremes of positivist rationalism and postmodernism, and demonstrating its utility for explaining contemporary issues. The book accomplishes these tasks. Yet, because the contributors have not systematically engaged the most prominent mainstream constructivist scholarship in the contemporary debate, this volume misses an opportunity to demonstrate the value of Onul's approach relative to other constructivists.

The most important contribution is Onul's "User's Manual" for constructivist scholarship (pp. 58–78). His original formulation in *World of Our Making* is a rich yet demanding work of abstract political theory that many scholars of international relations have found difficult to understand and/or use. Onul's user's manual provides an excellent summary of the central points raised in his book and presents the approach in a transparent and accessible fashion.

The editors' introduction and theoretical chapters by Kubálková and Gould join Onuf in clearly positioning constructivism as a third path between mainstream international relations and radical accounts. Kubálková's fine essay adds the nice twist of claiming E. H. Carr, a member of the realist canon, as a founder of constructivism (pp. 25–39). Hamman

(pp. 182-91) argues that constructivism is compatible with modern natural science theories that emphasize emergent properties of systems, nonlinearity, indeterminacy, conditionality, complexity, and chaos.

All these theoretical contributions reflect a central tendency of Onur's original formulation. In staking out the middle ground, the authors in this volume are as concerned with postmodernists and other radical theorists as with scholars in mainstream international relations. Indeed, they are in many ways more completely engaged with the participants in the "third debate" than with mainstream realist and neoliberal approaches (pp. 13-4). Since Onuf was crafting a broad treatise drawing from and commenting upon political philosophy, childhood development, linguistics, and other fields in addition to international relations, this connection with a variety of "post-" approaches places his work in a unique position in the center of a broad debate about social theory. In the international relations field, as practiced in the United States at least, postmodern and other radical approaches have been more marginalized in the scholarly debate. For this reason, the "centrist" position of this volume may not be recognized as centrist by mainstream scholars unconcerned about how constructivism allows the adoption of the insights of postmodernist thinking without abandoning the concept and practice of social science.

This way of framing the debate becomes somewhat problematic in the context of the evolution of constructivist thinking in mainstream international relations. Instead of Onuf and his collaborators, it is Finnemore, Katzenstein, Ruggie, Sikkink, Wendt, and others who have brought the constructivist approach into the mainstream journals and debate. These scholars examine puzzles that realist or neoliberal theories cannot explain. They generally do not seek to overturn the established traditions in their entirety. Indeed, many hope to construct a more liberal international system. Their scholarship places greater emphasis on such nonmaterial variables as culture, national identity, and international norms than is the case in most mainstream scholarship. Many are explicitly positivist in their methods. In sum, constructivism has become a more visible and influential approach precisely because it has become more mainstream.

The most visible contemporary advocates of constructivism receive little systematic attention in this volume. Kubálková, for example, distinguishes among hermeneutics, postmodernism, poststructuralism, dialectical approaches, critical theory, world systems theory, and numerous branches of Marxist thought, but he does not distinguish among different types of constructivist thought (pp. 42–3). Gould discusses the relationship between Onuf's work and that of Wendt (pp. 84–91), but he does not examine how Onuf's work speaks to a wider range of mainstream constructivist accounts.

The failure to engage more mainstream constructivist approaches becomes especially problematic in questions of method. This volume contains chapters by Kowert (pp. 101-22), Prugl (pp. 123-46), and Simon (pp. 147-69) that clearly demonstrate how, in contrast to postmodern approaches, constructivism lends itself to systematic investigation of the empirical world. It is difficult to know from these chapters, however, how Onur's brand of constructivism generates a method distinct from positivism, given that all the case chapters seem to follow in the best positivist traditions of Alexander George's structured-focused case study method. This is especially true of Kowert's essay on British national identity and the Suez Crisis, which spells out clear, explicit, and falsifiable hypotheses and then systematically examines the documentary record to provide confirming and/or disconfirming evidence. Constructivism has become popular in the

discipline, in part, because it privileges the use of case studies to understand politics, but should these case studies reflect a unique interpretivist method or "small n" positivism? This volume leaves the question unanswered.

Onul's vision of constructivism contains many insights not fully appreciated by more mainstream constructivist accounts. One is the importance of linguistic theories that show how the rules governing agents and social arrangements are fundamentally shaped by the language we use to express them (pp. 65-9). Another is how "rules yield rule" that inevitably privileges some actors over others in all social arrangements (pp. 74-7). The failure to address systematically the differences between Onul's vision of constructivism and mainstream varieties leaves these and other valuable contributions somewhat hidden. This will limit the influence of the book to some degree. Nevertheless, the essays do an excellent job of making constructivism accessible, of demonstrating that both rationalist and postmodern approaches miss crucial aspects of the social and political world, and of revealing that constructivism provides a systematic, scientific method for understanding the world.

The Enigma of 1989: The USSR and the Liberation of Eastern Europe. By Jacques Lévesque, trans. Keith Martin. Berkeley: University of California Press, 1997. 267p. \$35.00 cloth, \$19.95 paper.

Mark Kramer, Harvard University

Few developments in the twentieth century were more dramatic than the abrupt and largely peaceful collapse of East European communist regimes in 1989. For roughly forty years, the Soviet Union had maintained a bloc in Eastern Europe through the use or threat of military force. When Mikhail Gorbachev took office as general secretary of the Soviet Communist Party (CPSU) in March 1985, he displayed no sign of wanting to make fundamental changes in Soviet-East European relations. Yet, not five years later, when it became clear that Gorbachev would not rely on military force to prop up orthodox communist rulers in Eastern Europe, the whole Soviet bloc disintegrated, and noncommunist governments came to power. Soon thereafter, in October 1990, Germany was reunified as a member of NATO. This sudden transformation was all the more remarkable because it occurred with almost no violence.

The upheavals of 1989 have been chronicled and analyzed at great length. A vast number of books and articles on the subject have been published, and many more are likely to appear. Most of the literature covers events in a particular East European country (especially East Germany), tracing the emergence and growth of popular unrest and the downfall of the communist regime. This literature has given us many insights into the political and social developments that undermined communism in the region. What is not as well understood is the fundamental change that occurred in Soviet policy. Although numerous scholars and journalists have attempted to explain why Gorbachev ended Soviet hegemony in Eastern Europe, much of this work is inconclusive. Some argue that the Soviet Union was forced to give up its hold on Eastern Europe because of economic difficulties, relentless pressure from the United States, domestic political maneuvering, or some combination of these factors. Others contend that the reason was a desire to improve relations with the West. For the most part, these explanations have been inadequate or unconvincing. The motivations behind Gorbachev's actions are more complex than often alleged.

Jacques Lévesque's book, which first appeared in French

(1989, La fin d'un empire: L'URSS et la libération de l'Europe de l'Est, 1995), provides a far more complete and nuanced analysis of Soviet policy in Eastern Europe at the end of the 1980s. Lévesque, a political scientist at Quebec University who has written widely about the former Soviet Union, rightly points out that the collapse of communism in Eastern Europe was not at all surprising once it became clear that Soviet leaders would no longer use military force to keep orthodox regimes in power. The periodic revolts against communist rule and Soviet hegemony—in 1953, 1956, 1968, 1970, 1976, and 1980–81—left little doubt about the fragility of the East European regimes. What was greatly surprising, however, was the drastic change in Soviet policy. "Soviet foreign policy [until 1989] had always been at its most rigid and intolerant in relations with Eastern Europe" (p. 1). The Soviet Union's "permissiveness" in 1989, Lévesque argues, is therefore a "great enigma" that must be explained.

In a sophisticated analysis drawing in part on Kenneth Jowitt's characterization of Leninist regimes, Lévesque persuasively argues that when Gorbachev took office he had no intention of presiding over the dissolution of the Eastern bloc. His main priority was to redress his country's domestic problems. Over time, as Gorbachev increasingly realized that economic growth would require diverting resources from the military, he began to carry out major changes in Soviet foreign policy, including toward Eastern Europe. By 1989 Gorbachev's aim was to "transform the international order in Europe by a controlled overcoming of the continent's division," a process that "demanded a gradual democratization of Eastern Europe" (p. 3, emphasis in original). Lévesque overstates his case here somewhat—the main rationale for Gorbachev's policy was simply to forestall violent upheavals in Eastern Europe, which, if they had erupted, would have derailed his whole reform program—but Lévesque correctly emphasizes that "Gorbachev and his team believed that a reformed socialism in Eastern Europe was viable. They were convinced that by taking the initiative in democratizing these regimes, reform-minded Communist leaders could retain control of the process" (p. 3).

Lévesque's analysis is admirable not only because of its depth and richness but also because it gives due weight to the role of contingency ("improvisation, contradictions, and the absence of clear choices") in the events of 1989. Lévesque rejects the simplistic notion that the changes in Soviet policy were all inevitable. Everything seems inevitable in retrospect, but the reality is always more complex. The book captures that complexity very well.

The author is especially cogent in his depiction of Gorbachev's ambivalence in 1989. On the one hand, Gorbachev pressed for and countenanced drastic reforms in Eastern Europe that went far beyond anything that would have been tolerable under previous Soviet leaders. At each critical stage when the Soviet Union could have halted the changes engulfing Eastern Europe, Gorbachev chose instead to expedite events. By staunchly ruling out any use of force in the region, even when communism began disintegrating, the Soviet leader ensured himself a favorable place in history. On the other hand, Gorbachev often tried to back away from the full implications of the processes he unleashed. This was especially noticeable in late 1989, when he realized that the upheavals in Eastern Europe had sparked the outright collapse of the socialist bloc, not just a transition to reform communism. According to Lévesque, "Gorbachev's team first tried to deny the depth of the changes that were taking place and then tried to rationalize them in terms of their own emerging social-democratic view of the world" (p. 3). When Gorbachev finally tried to reassert control of events, he found it was too late. Having been deprived of "the levers he needed" to achieve the "greatest benefits for the USSR" (p. 3), he reluctantly acquiesced in the dismantling of both the Warsaw Pact and the Council for Mutual Economic Assistance.

The Engma of 1989 is impressive, but a few important problems arise. Chief among these is the author's vagueness about certain key concepts, especially his references to the "social democratization" of the CPSU. Lévesque never clearly defines this process or indicates how far he believes it would have gone. Because the notion of social democratization plays such an important role in what he calls the "ideology of transition" (a concept used to explain Gorbachev's new policy in Eastern Europe), one would have expected a far more careful and sustained treatment.

Another shortcoming is the limited range of sources consulted. Good use is made of a handful of crucial Soviet documents and a number of important memoirs by former Soviet officials, and the author also interviewed many of the former policymakers in Moscow. Yet, he neglected to use the large volume of other declassified materials in Moscow that are now available at the former CPSU archives and at the Gorbachev Foundation. He also failed to draw on some extremely important items that have been published in Russian journals (Istochnik, Svobodnaya mysl', and so on) and in document anthologies. Furthermore, Lévesque made almost no use of memoirs by former East European officials and no use at all of the huge collections of declassified materials in the East European archives. (The tiny number of documents and memoirs that he does cite from Eastern Europe were translated for him by research assistants.) It is a shame that Lévesque was unable to make much greater use of the rich archival holdings and memoir literature in Eastern Europe, which would have contributed a great deal to his analysis, especially his chapters about Soviet policy toward individual countries.

Fortunately, these drawbacks are outweighed by the book's many strengths. Lévesque provides a level of detail and nuance impossible to achieve before key documents (the ones he consulted) were released and memoirs were published. Although several earlier works on the subjectnotably Charles Gati, The Bloc That Failed: Soviet-East European Relations in Transition, 1990; Ronald Asmus et al., Soviet Foreign Policy and the Revolutions of 1989 in Eastern Europe, 1992; and Alex Pravda, ed., The End of the Outer Empire: Soviet-East European Relations in Transition, 1985-90, 1992—offered valuable preliminary assessments, Lévesque goes well beyond these books. Much more can still be done, especially with the continued outpouring of memoirs from both Eastern Europe and Russia and the enormous amount of declassified documentation that Lévesque failed to examine. Some of his comments about Soviet policy toward specific countries, as well as a few of his broader arguments, are bound to be contested. Even so, this book is, and will remain, an excellent starting point for anyone seeking to explain (or at least understand) one of the most momentous political events in modern history.

Fences and Neighbors: The Political Geography of Immigration Control. By Jeannette Money. Ithaca, NY: Cornell University Press, 1999. 248p. \$39.95.

Leah Haus, Vassar College

How do we explain variations in immigration control policy both among advanced industrialized countries and within these countries over time? Jeannette Money takes on this question in her ambitious book, Fences and Neighbors. Much of the literature that considers the sources of immigration policy is country specific and looks at factors at the national level of analysis (e.g., concepts of citizenship and national identity, economic recession) to explain patterns of immigration policy. Money criticizes this established literature and goes farther. She seeks to develop a generalizable argument to explain variations in immigration control policy across space and time. Pointing to the very uneven geographic concentration of immigrants within receiving countries, Money stresses that to explain a country's immigration control policy one needs to begin at the local rather than the national level.

Money develops two related arguments to address variations in immigration control policy. First, she seeks to explain societal preferences, which she argues are determined by conditions in local communities, such as unemployment rates, capital mobility rates, and rates of immigration increase. Second, she explains why and when these local societal preferences become translated into a country's national immigration policy. A local community's preferences will be added to the national political agenda when the local region is a swing district and perceived to be critical to maintaining or retaining a national electoral majority. Thus, economic distress and unemployment in a local community with a significant portion of immigrants will generate a move to restrictionism at the national level if the district is a swing district. Money's overall argument is that "local conditions drive local preferences, but national politicians are driven by national electoral incentives to play or not to play the 'immigrant card' " (p. 10). She tests this argument on three countries the United Kingdom, France, and Australia and focuses on the 1960s and 1970s.

Fences and Neighbors makes an important contribution to our understanding of immigration policymaking and presents a refreshing addition to the established scholarship. The book is an admirable attempt to move beyond the unique and develop a generalizable framework for analysis. Money presents an original argument on why and when local community preferences for restrictionism are translated into policy at the national level. She provides empirical data from the three case studies to support this part of the argument.

The difficulties in developing and testing a generalizable argument that can simultaneously explain variations in policy between and within countries over time are apparent in the book. The focus is on policy changes in the direction of restrictionism, and the arguments on the sources of restrictionism are tested on a quite limited period (the 1960s and 1970s). One is left to wonder whether the causes of restrictionism may have changed during the course of the twentieth century.

The book gives much less attention to developing and testing arguments that explain policy changes in the directions of openness. For Money, the sources of openness are limited to business firms (pp. 53-6). Her argument leads one to expect a policy change in the direction of openness when there are tight local labor markets in swing districts, but the book does not rigorously test this argument. A number of pertinent case studies in the twentieth century could have been explored, and one is left to wonder whether business firms that were not in swing districts also might have sometimes influenced national immigration policy. Moreover, Money's focus on business firms to explain openness sounds plausible for earlier decades in the twentieth century, but it seems inadequate for a full explanation of changes in the direction of openness in the late twentieth century. For example, France has instituted various amnesty programs,

most notably in 1981-82 and 1997-98, and the United States instituted an amnesty program in 1986. People regularized in amnesty programs are documented in national statistics under the "annual per capita gross flow of legal resident aliens," the measure Money uses to operationalize immigration control policy (pp. 22-4). At the local community level, societal preferences in New York City have continued to be relatively open to immigration in comparison with Los Angeles. Although these openings are narrow, they are nonetheless significant, and it is likely that an explanation needs to look beyond business firms to other actors, such as civil rights groups and immigrant associations. To balance the arguments on the sources of restrictionism, as the author concludes, future research could give more attention to the sources of openness so as to address thoroughly variations in immigration control policy. Fences and Neighbors is an ambitious book that gives a thought-provoking argument on why and when countries move to restrictionist immigration control policies. It is clearly required reading for scholars of immigration policy.

Ethics and Authority in International Law. By Alfred P. Rubin, Cambridge: Cambridge University Press, 1997. 206p. \$59.95.

Kenneth W. Thompson, University of Virginia

Historically, international law has participated in most of the great debates in normative thought. Yet, surprisingly, in the last 25 years the role of lawyers has been marginal. The dominating thinkers tend to be political scientists, such as Hans J. Morgenthau, the theologian Reinhold Niebuhr, and diplomats, such as George F. Kennan. As for international lawyers, Charles de Visscher, author of *Theory and Reality in Public International Law* (1957), stands out.

Alfred Rubin of the Fletcher School of Law and Diplomacy joins this group. His starting point is a view with which Judge de Visscher would have agreed. International law must comprehend the obstacles to no less than the arguments for international law. Universal crimes do not assure universal jurisdiction for war crimes or human rights. Despite Nuremberg, there has been no shortage of wars in the past half century. Intellectual models or ontologies of academics are often based on law that is unconnected with the realities of authority and predictable state practice.

Having stated his assumptions, Rubin goes on to evaluate the historical forces and major philosophies, such as naturalism and positivism, and the interrelations of reality and theory. These sections knit together broad concepts and practical realms of international law. The last three chapters concentrate on theory and practice, interdependence, the twenty-first century, and conclusions. They bring to completion a rather admirable review of a large and complex subject.

The great strength of the volume is the author's single-minded effort to explain the purposes and problems of moral and legal reasoning. Rubin seeks to clarify what each school of thought comprehends. His pedagogy sometimes inhibits clear and simple prose, and the book is not easy reading for the uninitiated. Rubin sometimes falters in doing justice to contending viewpoints, and translating complex ideas from one sphere to another, from law to political theory, is a problem. Finally, this is a textbook on types of law—positive, divine, natural, and eternal—that bespeaks a familiarity with classical and medieval theorists. It may be that Rubin's mastery of different concepts of law in their historical setting is his single most valuable contribution.

Rubin's approach assumes that the reader is at least

minimally familiar with the earlier periods in the history of international law. The author gives an account of his presentation in 1986 to a group convened at Notre Dame University by the Carnegie Council on Ethics and International Affairs. In that paper, he set out his conclusions in a "positivist" model that was meant to reflect the realities of international society addressed in particular to human rights. At the same time, he sought to explain the jurisprudential assumptions on which his paper was based, which were at odds with those of many in his audience. His model conflicted with the moral "naturalist" model dominant in most of the scholarly literature and in the minds of the majority of his audience. When the question of publication came up, it was clear that his paper would not suit the editor of the projected conference volume. After a similar experience at another conference, Rubin concluded that his subject required book-length treatment, and the present volume is the result.

As one reviews the international law literature on human rights as well as on intervention, divisions of this type are all too familiar. Scholars approach the subject with crusading zeal either to substantiate the legal basis for their conclusions or to overturn the argument that the realities of international society support an interventionist approach to human rights. In this respect, violations of human rights are reminiscent of crimes against humanity in the international law of Nuremberg. While Rubin may exaggerate his position as a lone voice defending the positivist viewpoint, his circumstances are familiar in the history of international law. In the 1930s and 1940s, dissenters to what was then the dominant reformist view of international law made similar complaints. They included Morgenthau and Nicholas Spyknard of Yale. Thus, precedents exist for the beleaguered defender of a minority viewpoint in international law scholarship. Although the situations in the 1930s differ from those of 1986 to 1987, the criticisms in both instances are of the failure of the reformers to come to terms with the realities of international societythe more things change, the more they remain the same.

Ethics and Authority makes a contribution to the history and theory of international law, especially in reviewing widely held assumptions that cry out for reexamination. Neither general international law nor the pertinent treaties qualify the United States, for example, to apply such rules to foreigners acting within their own countries. Yet, intellectual models for twentieth-century world order invoke these assumptions not only as they reflect different aspects of culture and definitions of law but also whether they relate to the realities of "authority." Rubin finds this practice demeaning to the law, its influence on civilized behavior, and subversive to the Yugoslavia and Rwanda cases. As for international criminal courts, the U.N. Security Council, when it fails to invite independent analysis for judging their legal capacity, repeats the same error. None of the international tribunals so constituted have jurisdiction for applying the rules and standards of universal law to the countries that most enthusiastically support them. The Nuremberg precedent of victors trying defeated Nazi leaders is recapitulated. (The second author of the Molotov-Ribbentrop pact was tried for conspiring to commit aggression, but no Soviet officials were defendants.) Rubin finds that practice morally one sided and legally dubious. Nevertheless, the Nuremberg example can be useful and significant for the future.

A second contribution Rubin makes is his defense of legal positivism and a "positivist" model that reflects the realities of the current international society better than the "naturalist" model. Given Rubin's attention to law as moral principle, his concluding summary reveals the weight of the evidence undergirding legal positivism. He connects the two in a

discussion of the objective basis of natural law with reference to Aristotle and Vitoria.

Finally, Rubin concludes with a discussion of the relationships of law, morality, and the international political order. In almost 20 tightly written pages, he explores the role of the positivist and naturalist views and examines the claim that "force is the bottom line" versus the concept that justice is determining. He finds no evidence on this question and others that the modern generation is more insightful than earlier thinkers, beginning with Plato and Aristotle.

The Challenge of Fundamentalism: Political Islam and the New World Disorder. By Bassam Tibi. Berkeley: University of California Press, 1998. 262p. \$29.95.

Vali Nasr, University of San Diego

Two decades have passed since the Iranian revolution underscored the centrality of Islam to politics in Muslim societies from Malaysia to Morocco. Since then much has been written on the origins and development of political Islam, more popularly referred to as Islamic fundamentalism or Islamism. Through these works we have come to learn much about the directives of Islamic ideology, the social base of political Islam, the dynamics of its politics, and its relation to state authority. Still, there is much about this phenomenon that needs be explained; more important for comparative politics, the rise of ideational politics in modernizing societies must be properly theorized. The Challenge of Fundamentalism promises to address these concerns. It sets out not only to explain political Islam but also to do so in a theoretical language, using the heuristic tools of the social sciences to shed light on the root causes and development of this phenomenon.

The book does not fulfill its promise. Although there is some discussion of the origins and development of political Islam, for the most part Tibi is concerned with the recent public discussion surrounding the implications of the rise of political Islam for globalization and civilization dialogue (pp. 15–9, 64–113, 199–211). He analyzes how the end of the Cold War—and, hence, the West's search for a new bugbear—as well as the groping for a new world order and the Persian Gulf War are relevant for Western characterizations of Islam. In so doing Tibi revisits arguments that have been put forward by John L. Esposito (The Islamic Threat: Myth or Reality? 1995), Fred Halliday (Islam and the Myth of Confrontation: Religion and Politics in the Middle East, 1995), and Dale Eickelmand and James Piscatori (Muslim Politics, 1994), among others.

What is perhaps new here is the importance Tibi places on Samuel Huntington's "clash of civilizations" thesis (The Clash of Civilizations and the Remaking of World Order, 1996) in constructing his framework of analysis, but Tibi appears to be less concerned with the conceptual implications of that thesis and more interested in debunking the shibboleths that lie at its foundation (pp. 44, 180-3). Consequently, despite the theoretical language, the book deals very little with theory. There also is not much in the form of factual details, history, and case study analysis. Instead, the author remains content with a rhetorical debate about the Huntington thesis. Rather than a social scientific study of political Islam, The Challenge of Fundamentalism is Tibi's entry into the public discussions that Huntington has generated.

Tibi's central argument is as follows. Islam as a religion must be distinguished from political Islam. The former is open to interpretation and can have liberal, mystical, and apolitical manifestations, whereas the latter is a rigid political ideology. There is nothing new in this argument. The distinction between religion and political ideology has been amply discussed in social science inquiries into the role of religion in the politics of Muslim societies, and it has been generally accepted by all observers of the political scene in those societies. It goes without saying that the public discussion of political Islam is less sensitive to this distinction, but this is a book for specialists who will not benefit from belaboring the obvious. Indeed, the distinction is posed here not so much as a conceptual problem but as a straw man. Tibi's elaborate arguments in the end resolve a problem that does not really exist for his audience. The author would have done better to go beyond merely distinguishing between Islam and political Islam to grapple with empirical evidence so as to shed light on the relevance of political Islam to issues of significance to both the social sciences and the study of politics in Muslim societies—patterns of authority, regime stability and change, and prospects for economic reform.

Tibi writes in the language of the social sciences, but what begins as social scientific inquiry quickly becomes his interpretation of Islam and the religion's views on society and politics (pp. 20-32, 139, 158-77). At the least, this creates methodological confusion. Furthermore, it is apparent that the author is not at home with the Islamic sources on which he bases his interpretation of the fundamental directives of the Islamic faith in contradistinction to the prescriptions of Islamic ideology. For instance, he draws on Islamic mystical positions to present a humanistic reading of Islam and to challenge the validity of Islamic ideology (p. 158). Yet, Tibi does not discuss what Islamic mysticism is or, more important, how in theory as well as in practice it can supplant the dominance of Islamic law and the orthodox interpretation of it to foster humanism and tolerance. This point is all the more important since Tibi proffers Islamic mysticism as a solution in the face of the fact that a number of Islamic leaders and activists, Ayatollah Khomeini and Mawlana Mawdudi among others, were students of Islamic mysticism.

Little in this book ensures that it will be central to the study of political Islam. Its contribution at the theoretical level is rather limited, and there is not much that is new in terms of facts and information. The study of political Islam—its ideology, social base, and politics—has already moved far beyond the conceptual framework and conclusions of this book.

Industrial Crists and the Open Economy: Politics, Global Trade, and the Textile Industry in the Advanced Economies. By Geoffrey R. D. Underhill. New York: St. Martin's, 1999, 280p. \$65.00.

Sherry L. Bennett, Rice University

The politics and process of trade policy formation have captured the research interest of many scholars. A growing number use formal models to examine the behavior of interests groups, institutions (e.g., Michael J. Gilligan, Empowering Exporters, 1997; Sharyn O'Halloran, Politics, Process, and American Trade Policy, 1994), and the interaction of these factors at the domestic and international level (e.g., Helen V. Milner, Interests, Institutions, and Information, 1997; Beth A. Simmons, Who Adjusts? 1994). Industrial Crisis takes a traditional approach to explain, in particular, the rise and decline of protection in the clothing and textile industry. Underhill's study is motivated by two principal questions: Why did the Multi-Fibres Arrangement (MFA) for the textile and clothing sector, signed in 1973, emerge during a period when liberalization of manufactured goods trade was generally expanding and increasing in scope? What factors explain why states that expended great efforts to secure international cooperation on the MFA subsequently led the way to dismantle it during trade negotiations in the Uruguay Round? To answer these questions Underhill provides a detailed account of the textile industry that is an extensive case study, beginning in the early 1970s and extending roughly twenty years.

In response to the first question, Underhill explains the reasoning behind the policy preferences among textile and clothing interests. Not surprisingly, in the face of an industrial crisis that began to emerge in the early 1970s, inefficient clothing producers and textile manufacturers, unwilling or unable to adapt to a highly competitive, dynamic marketplace, demanded a variety of subsidies and import restrictions to ease the pain of adjustment. Both readers who are unfamiliar with and interested in the technical complexities of the textiles and clothing industry will be engaged from the beginning. Chapter 1 gives an intricate description of the complex web of interrelationships between producers of raw fibers and manufacturers who assemble clothes and related finished products. Although each stage of the process uses different technologies and has distinct factor mixes, Underhill convincingly demonstrates the interdependencies. Dislocation at any stage is shown to have negative repercussions on production and manufacturing in the entire sector, which forms the logical basis for the convergence in preferences among the various interests in this industry. Chapter 2 delves into the particulars of domestic demand for clothing and textiles in the French market. Within only ten years, demand for finished products dropped, growth slowed, and the level of foreign competition increased. As the analysis of the French case demonstrates, many firms were unwilling to take advantage of their competitive factor mixes or seize opportunities created by the changing market, hence the emergence of a crisis that unified the industry's demand for protection and the eventual passage of the MFA

Although Underhill does a thorough job of establishing the basis for the policy preferences of textile firms, he falls short of demonstrating how these interests successfully organized and later interacted with institutions to influence policy. Chapter 3 examines the pattern of state-industry relations in France with the intended purpose of showing how the textile industry captured the domestic trade policy agenda, but unlike Mancur Olson's The Logic of Collective Action (1968) and the works cited above, there is no convincing account for the logic associated with these interests organizing. Instead, Underhill describes the sector's development in postwar France in an effort to elicit its economic and political salience to the overall economic well-being of the state. Although the regional distribution of the industry was concentrated in particular communities, this alone does not translate into effective political pressure or sufficiently explain the responsiveness of policymakers. Missing in the details of the French experience is a framework that effectively delineates the formation of coalitions, political pressure, and responsiveness by policymakers, all of which can be generalized to the experience of other states.

Important textile groups in Britain and the United States are discussed in some detail, but the extent of their influence is demonstrated through a series of interviews with people involved in the MFA negotiations. Noticeably absent is a sense of how these groups successfully infiltrated the policy-making agenda. This is important because a number of manufacturing interests were competing to influence the trade policy agenda in favor of liberalization. For example, manufacturing exporters in the United States, which had gained political power over time, were able to influence the

passage of the 1962 Trade Expansion Act and other trade policies designed to increase free trade. Their success was due in part to the 1934 Reciprocal Trade Agreement Act and its various extensions, which served to lower the costs to these interests associated with collective action and create the conditions necessary to shift legislative preferences away from protection toward liberalization. These arguments have recently been expressed by Gilligan (Empowering Exporters, 1997) and Michael Bailey, Judith Goldstein, and Barry Weingast ("The Institutional Roots of American Trade Policy: Politics, Coalitions, and International Trade," World Politics 49 [1997]: 309–38). In light of this work, Underhill is unable to answer sufficiently a principal question motivating his research.

Underhill extends his conjecture in chapter 4 to the activities of a transnational coalition of textile interests and their purported capture of the policy agenda in the international domain. One might expect a discussion about the dynamics of bargaining at both the domestic and international level, but there is little explanation of either the formation of an international coalition (e.g., the mobilization of these groups across states) or how it could exert political pressure on policymaking in multilateral institutions. In this sense, one strength of this book becomes one of its greatest weaknesses. Most of the discussion centers on France. Al-

though this provides immense detail about the variety of actors and interests involved in the policymaking process associated with the MFA, it is not clear how generalizable the conjectures are to other states involved in the bilateral negotiations. For example, although Britain and the United States are democratic states, they have different political institutions. How interest groups forge linkages and exert political pressure on policymaking varies among the states in Underhill's study. As expressed by Milner (Interests, Institutions, and Information, 1997) and by George Tsebelis ("Decision-Making in Political Systems: Veto Players in Presidentialism, Parliamentarianism, Multicameralism and Multipartyism," British Journal of Political Science 24 [1995]: 289-325), variations in constitutional authority, electoral incentives, and the distribution of political authority affect decision making on policy across variable political systems.

Although Underhill does not adequately appreciate how variations in political institutions across states influence the formation of trade policy, *Industrial Crisis and the Open Economy* amply illustrates that explanations of policy focusing solely on structural determinants are inadequate. This is demonstrated time and again by Underhill's thorough analysis of interests associated with the French textile and clothing industry.

Editor's Notes

Authors are reminded that the APSR does not accept new manuscript submissions during August. Invited revisions and reviews may be submitted at any time and are processed upon arrival. Please time new submissions to arrive either by the end of July or at the beginning of September. New manuscripts arriving during August will be held for processing in September.

INSTRUCTIONS TO CONTRIBUTORS

General Considerations

The American Political Science Review strives to publish scholarly research of exceptional merit, demonstrating the highest standards of excellence in conceptualization, exposition, methodology, and craftsmanship. Because the Review reaches a diverse audience of scholars and practitioners, contributors should demonstrate how their analysis illuminates a significant research problem, or answers an important research question, of general interest in political science. For the same reason, authors should strive for a presentation that will be understandable to as many scholars as possible, consistent with the nature of their material.

Since the Review publishes original research, authors should not submit articles containing tables, figures, or substantial amounts of text already published or forthcoming in other places, or that are included in other manuscripts submitted for review, whether to book publishers or periodicals (including online journals), or are otherwise committed. In many such cases, subsequent publication of this material would violate the copyright of the other publisher. The APSR also does not consider papers currently under review at other journals or that duplicate or overlap with parts of larger manuscripts that have been submitted to other publishers (including publishers of both books and periodicals). Since space is at a premium, submission of articles substantially similar to manuscripts submitted or published elsewhere, or to part of a book or other larger work, is also strongly discouraged. If there is any doubt about whether these policies would apply to a particular case, the author should discuss any such publications related to a submission in a cover letter to the Editor. The Editor should also be notified of any related submissions to other publishers, whether for book or periodical publication, that occur while an article is under review at the APSR and that would fall within the scope of this policy. Copies of related publications may be requested.

For manuscripts containing quantitative evidence and analysis, authors should describe their empirical procedures in sufficient detail to permit reviewers to understand and evaluate what has been done and, in the event the article is accepted for publication, to permit other scholars to carry out similar analyses on other data sets. For example, for surveys, at the least,

sampling procedures, response rates, and question wordings should be given; authors are encouraged to calculate response rates according to one of the standard formulas given in The American Association for Public Opinion Research, Standard Definitions: Final Dispositions of Case Codes and Outcome Rates for RDD Telephone Surveys and In-Person Househould Surveys (Ann Arbor, MI: AAPOR, 1998). This document is available on the Internet at http://www.aapor.org/ ethics/stddef.html>. For experiments, provide full descriptions of experimental protocols, methods of subject recruitment and selection, information about any payments and debriefing procedures, and other relevant details. It is desirable for articles to be selfcontained, and authors should not refer readers to other publications for descriptions of these basic research procedures.

Please indicate variables included in empirical analyses by capitalizing the first word in the variable name and italicizing the entire variable name the *first* time each is mentioned in the text. Authors should also be consistent in using the same names for variables in text and tables, and avoid overuse of acronyms and computer abbreviations when discussing variables in the text. All variables appearing in tables should have been mentioned in the text and the reason for their inclusion in the analysis discussed.

As part of the review process, authors may be asked to submit additional documentation if procedures are not sufficiently clear; the review process works most efficiently if such information is given in the initial submission. If readers are advised that additional information is available from the author, printed copies of that information should be submitted with the manuscript. If the amount of this supplementary information is extensive, please inquire about alternate procedures.

The APSR uses a double-blind review process. Authors should follow the guidelines for preparing anonymous copies in the "Specific Procedures" section below.

Manuscripts that are largely or entirely critiques or commentaries on previously published articles will be reviewed using the same general procedures as for regular articles with one exception. In addition to the usual number of reviewers, such manuscripts will also be sent to the scholar(s) whose work is being critiqued, in the same anonymous form as they are sent to other reviewers. Comments from the original author(s) to the editor will be invited as a supplement to the advice of regular reviewers. There are several purposes for this notice to the original author(s): (1) to encourage review of the details of analyses or research procedures that might occasionally escape the notice of disinterested reviewers; (2) to enable prompt publication of critiques by supplying critiqued authors with early notice of their existence and, therefore, more adequate time to reply; (3) as a courtesy to critiqued authors.

Authors of critiques should therefore send as many additional copies of their manuscripts as will be re-

quired for this purpose.

Manuscripts being submitted for publication should be sent to Professor Ada W. Finifter, Editor, American Political Science Review, Department of Political Science, Michigan State University, 303 South Kedzie Hall, East Lansing, MI 48824-1032. Correspondence concerning manuscripts under review may be sent to the same address or, preferably, by e-mail to apsr@ssc.msu.edu. Please note that the APSR does not process new manuscripts during August; new manuscripts should be mailed to arrive either before or after. Invited revisions and reviews may be submitted at any time and will be processed upon arrival.

Manuscript Formatting

Manuscripts must not be longer than 45 pages including text, all tables and figures, notes, references, and appendices. The page size guideline is based on the U.S. standard 8.5 X 11 inch paper and must be adjusted accordingly by authors who are submitting manuscripts printed on longer paper. Font size must be at least 11 point for all parts of the paper. The entire paper must be double-spaced, with the sole exception of tables for which double-spacing would require a second page otherwise not needed. All pages should be numbered in one sequence, and text should be formatted using a normal single column no wider than 61/2 inches, as is typical for manuscripts (rather than the double-column format of the published version of the Review), and printed on one side of the page only. Include an abstract of no more than 150 words. The American Political Science Review style of embedded citations should be used, and there must be a separate list of references at the end of the article. Please do not use footnotes for simple citations. These specifications are designed to make it easier for reviewers to read and evaluate papers. Papers not adhering to these guidelines are subject to being rejected without review.

For submission and review purposes, authors are encouraged to place footnotes at the bottom of the pages instead of using endnotes and may locate tables and figures (on separate pages and only one to a page) approximately where they fall in the text. However, manuscripts accepted for publication must be submitted with endnotes, and with tables and figures on separate pages at the back of the manuscript with standard indications of text placement, e.g., [Table 3 about here]. In deciding how to format your initial submission, please consider the necessity of making these changes if your paper is accepted. Authors of accepted manuscripts are also required to submit camera-ready copy of graphs or other types of figures. Instructions will be provided.

For specific formatting style of citations and references, please refer to any articles in the most recent issue of the *Review*. For unusual style or formatting issues, authors may consult *The Chicago Manual of Style*, 14th edition. For review purposes, we do not require that citations and references be in specific

APSR format, although some generally accepted format should be used, and all citation and reference information should be provided.

Specific Procedures

Please follow these specific procedures for submission:

- Submit five copies of manuscripts. Please review all
 pages of all copies to make sure all copies contain all
 tables, figures, appendices, and bibliography mentioned in the manuscript and that all pages are legible.
- 2. To comply with the *Review's* policy of double-blind peer reviews, only one of the five copies submitted should be fully identified as to authorship and four should be in anonymous format.
- 3. For anonymous copies, if it is important to the development of the paper that an author's previous publications be cited, this should be done in a way that does not make the authorship of the submitted paper obvious. This is usually most easily accomplished by referring to oneself in the third person and including normal references to the work cited in the list of references. Under no circumstances should an author's prior publications be included in the bibliography in their normal alphabetical location but with the author's name deleted. Assuming that text references to an author's previous work are in third person, full citations should be included as usual in the bibliography. Use of other procedures to render manuscripts anonymous should be discussed with the Editor prior to submission. Authors also should not thank colleagues in notes or elsewhere in the body of the paper or mention institution names, web page addresses, or other potentially identifying information. All acknowledgements must appear on the title page of the identified copy only. Manuscripts that are not judged anonymous will not be reviewed.
- 4. Cover pages: The first page of the four anonymous copies should contain only the title and an abstract of no more than 150 words. The first page of the identified copy should contain (a) the name, academic rank, institutional affiliation, and contact information (address, telephone, fax, email) for all authors; (b) in the case of multiple authors, an indication of the author who will receive correspondence; (c) any relevant citations to the author's previous work that have been omitted from the anonymous copies; (d) acknowledgements, including the names of any colleagues who have provided comments to the author on the manuscript. If the identified copy contains any unique references or is worded differently in any way, please mark this copy with "Contains author citations" at the top of the first page.
- Please also send a loose copy of the cover page of the identified copy.
- 6. Authors having access to e-mail should send a copy of the abstract to apsr@ssc.msu.edu, when the submission is mailed. The subject line should contain the word Abstract followed by the first

listed author's last name. The body of the message should contain the title of the paper, the names of all authors, and the abstract (as on the loose page described above). E-mail submission of the abstract is not required but will help us process your manuscript more efficiently.

7. Authors should not fax abstracts, send any part of the paper itself by e-mail, or send the abstract by e-mail before their submission packet is in the mail. No copies of submitted manuscripts can be returned. Since submission procedures may be modified in the future, authors are encouraged to check for current instructions in the most recent issue of the Review or at our Internet web site, http://www.ssc.msu.edu/~apsr/.

ELECTRONIC ACCESS TO THE AMERICAN POLITICAL SCIENCE REVIEW

Full text of the American Political Science Review is available in several electronic formats and through several different venders.

Except for the last three years (as an annually "moving wall"), back issues of the American Political Science Review beginning with Volume 1, Number 1 (November 1906) are available online through JSTOR (http://www.jstor.org/). Issues through Volume 89, Number 4 (December 1995) are currently available. At present, while JSTOR's complete collection is available only via institutional subscription, individual subscriptions to the APSR part of JSTOR are now available to APSA members. Please contact Member Services at APSA for further information.

Full text access to current issues of both the APSR and PS is also available online by library subscription from a number of database vendors. Currently, these include University Microfilms Inc. (UMI) (via its CD-ROMs General Periodicals Online and Social Science Index, and the online database ProQuest Direct), Online Computer Library Center (OCLC) (through its online database First Search as well as on CD-ROMs and magnetic tape), and the Information Access Company (IAC) (through its products Expanded Academic Index, InfoTrac, and several online services [see below]). Others may be added from time to time.

APSR is also available on databases available through six online services: Datastar (Datastar), Business Library (Dow Jones), Cognito (IAC), Encarta Online Library (IAC), IAC Business (Dialog), and Newsearch (Dialog).

The editorial office of the APSR is not involved in the subscription process to either JSTOR for back issues or the other vendors for current issues. Please contact APSA, your reference librarian, or the database vendor, as appropriate, for further information about availability.

BOOK REVIEWS

All book review correspondence should be sent to the Book Review Editor, Professor Mark Lichbach, American Political Science Review Book Review, Department of Political Science, University of California, Riverside, Riverside, CA 92521-0118. E-mail: apsrbook@ wizard.ucr.edu. Authors wishing their book to be considered for review should ask their publisher to send a copy to the Book Review Editor. Those interested in reviewing books should send their vita to the Book Review Editor.

OTHER CORRESPONDENCE

The American Political Science Association's address, telephone and fax are: 1527 New Hampshire Avenue, NW, Washington, D.C. 20036, (202)483-2512, and fax (202)483-2657. E-mail: apsa@apsanet.org. Please direct correspondence as follows:

Information, including news and notes, for *PS*Dr. Robert J-P. Hauck, Editor, *PS*E-mail: rhauck@apsanet.org

Circulation and subscription correspondence (domestic claims for nonreceipt of issues must be made within four months of the month of publication; overseas claims, eight months)

EXEDITING REQUESTS FOR COPYING APSR AND PS ARTICLES FOR CLASS USE AND OTHER PURPOSES

Class Use

The Comprehensive Publisher Photocopy Agreement between APSA and the Copyright Clearance Center (CCC) permits bookstores and copy centers to receive expedited clearance to copy articles from the APSR and PS in compliance with the Association's policies and applicable fees. The general fee for articles is 75 cents per copy. However, current Association policy levies no fee for the first ten copies of a printed article, whether in course packs or on reserve. Smaller classes that rely heavily on articles (i.e., upper level undergraduate and graduate classes) can take advantage of this provision, and faculty ordering ten or fewer course packs should bring it to the attention of course pack providers. APSA policy also permits free use of electronic library reserve with no limit on the number of students who can access the electronic reserve. Both large and small classes that rely on these articles can take advantage of this provision. The Copyright Clearance Center's address, telephone, and fax are: 222 Rosewood Drive, Danvers, MA 01923, (978)750-8400, and fax (978)750-4474. This agreement pertains only to the reproduction and distribution of APSA materials as hard copies (e.g., photocopies, microfilm, and microfiche).

The Association of American Publishers (AAP) has created a standardized form for college faculty to submit to a copy center or bookstore to request copyrighted material for course packs. The form is available through the CCC, which will handle copyright permissions.

APSA also has a separate agreement pertaining to CCC's Academic E-Reserve Service. This agreement allows electronic access for students and instructors of a designated class at a designated institution for a specified article or set of articles in electronic format. Access is by password for the duration of a class.

Please contact your librarian, CCC, or the APSA Reprints Department for further information.

APSR Authors

Authors of APSR articles may use their own articles in course packs or other printed materials without payment of royalty fees and may post their articles at personal or institutional web sites as long as the APSA copyright notice is included.

Other Uses of APSA-Copyrighted Materials

For any further copyright issues, please contact the APSA Reprints Department.

INDEXING

Articles appearing in the Review before June 1953 were indexed in The Reader's Guide to Periodical Literature. Current issues are indexed in ABC Pol Sci; America, History and Life 1954-; Book Review Index; Current Contents: Social and Behavioral Sciences; EconLit; Energy Information Abstracts; Environmental Abstracts; Historical Abstracts; Index of Economic Articles; Information Service Bulletin; International Index; International Political Science Abstracts; The Journal of Economic Literature; Periodical Abstracts; Public Affairs; Recently Published Articles; Reference Sources; Social Sciences and Humanities Index; Social Sciences Index; Social Work Research and Abstracts; and Writings on American History. Some of these sources may be available in electronic form through local public or educational libraries. Microfilm of the Review, beginning with Volume 1, and the index of the Review through 1969 are available through University Microfilms Inc., 300 North Zeeb Road, Ann Arbor, MI 48106 (www.umi. com). The Cumulative Index to the American Political Science Review, Volumes 63 to 89: 1969-95 is available through the American Political Science Association.

Increasing Returns, Path Dependence, and the Study of Politics

PAUL PIERSON Harvard University

It is increasingly common for social scientists to describe political processes as "path dependent." The concept, however, is often employed without careful elaboration. This article conceptualizes path dependence as a social process grounded in a dynamic of "increasing returns." Reviewing recent literature in economics and suggesting extensions to the world of politics, the article demonstrates that increasing returns processes are likely to be prevalent, and that good analytical foundations exist for exploring their causes and consequences. The investigation of increasing returns can provide a more rigorous framework for developing some of the key claims of recent scholarship in historical institutionalism: Specific patterns of timing and sequence matter; a wide range of social outcomes may be possible; large consequences may result from relatively small or contingent events; particular courses of action, once introduced, can be almost impossible to reverse; and consequently, political development is punctuated by critical moments or junctures that shape the basic contours of social life.

t is increasingly common for social scientists to describe political processes as "path dependent." Claims of path dependence have figured in both classic works of comparative politics, such as Lipset and Rokkan's (1967) analysis of European party systems, and more recent analyses on topics such as labor incorporation in Latin America (Collier and Collier 1991), the outcome of state-building processes in Europe (Ertman 1996), and the comparative development of health care systems (Hacker 1998). The notion of path dependence is generally used to support a few key claims: Specific patterns of timing and sequence matter; starting from similar conditions, a wide range of social outcomes may be possible; large consequences may result from relatively "small" or contingent events; particular courses of action, once introduced, can be virtually impossible to reverse; and consequently, political development is often punctuated by critical moments or junctures that shape the basic contours of social life (Collier and Collier 1991; Ikenberry 1994; Krasner 1989). All these features stand in sharp contrast to prominent modes of argument and explanation in political science, which attribute "large" outcomes to "large" causes and emphasize the prevalence of unique, predictable political outcomes, the irrelevance of timing and sequence, and the capacity of rational actors to design and implement optimal solutions (given their resources and constraints) to the problems

that confront them. If path dependence arguments are indeed appropriate in substantial areas of political life, they will shake many subfields of political inquiry. This essay argues that they are.

The analysis begins with a general discussion of path dependence that seeks to clarify some important ambiguities surrounding the concept. I then outline and investigate the distinctive characteristics of social processes subject to what economists call "increasing returns," which could also be described as self-reinforcing or positive feedback processes. For some theorists, increasing returns are the source of path dependence; for others, they typify only one form of path dependence. The focus here is on increasing returns processes, both because they are of great social significance and because (in contrast to broader conceptions of path dependence) social scientists are beginning to develop rigorous arguments about the causes and consequences of increasing returns. Increasing returns dynamics capture two key elements central to most analysts' intuitive sense of path dependence. First, they pinpoint how the costs of switching from one alternative to another will, in certain social contexts, increase markedly over time. Second, and related, they draw attention to issues of timing and sequence, distinguishing formative moments or conjunctures from the periods that reinforce divergent paths. In an increasing returns process, it is not only a question of what happens but also of when it happens. Issues of temporality are at the heart of the analysis.

The following section reviews the development of increasing returns arguments in the social science discipline in which they have received the greatest attention: economics. This review suggests the wide sweep of potential applications, even in a field that might be expected to be hostile to the idea. More important, these economic applications provide the most analytically developed discussions of increasing returns. Economists not only have clarified the principal implications of path dependence but also have identified many of the specific aspects of a particular social environment that generate such processes.

The discussion of economics prepares the way for an exploration of the distinctive characteristics of politics.

Paul Pierson is Professor of Government, Harvard University, Cambridge, MA 02138.

An earlier version of this article was presented as the Jean Monnet Visiting Professor Lecture, European University Institute (EUI), April 1997. I am very grateful to Andy Rudalevige and Jeremy Weinstein for research assistance on this project and to the German Marshall Foundation, Simon R. Guggenheim Foundation, and the Weatherhead Center for International Affairs for financial support. I have received helpful comments on earlier drafts from many people, including several thoughtful reviewers for the APSR I owe particular thanks to Frank Baumgartner, David Collier, Pepper Culpepper, Jeffry Frieden, Daniel Goldhagen, Jacob Hacker, Peter Hall, Alan Jacoba, Margaret Levi, Robert Mickey, Andrew Moravcsik, Gerardo Munck, Alec Stone, and Kathleen Thelen. I also benefited from discussions at the Harvard Center for European Studies, Columbia University, the EUI, the Centro de Investigación y Docencia Éconómicas (CIDE), the University of California at Berkeley, the University of Washington, and Yale University.

Rather than simply apply extant arguments in economics to political phenomena, we need to consider the features of the political world that require modifications in the use of path dependence claims. I will demonstrate that increasing returns arguments are at least as relevant to an understanding of politics as they are in other areas of the social sciences. Indeed, factors such as the prominence of collective activity in politics, the central role of formal, change-resistant institutions, the possibilities for employing political authority to magnify power asymmetries, and the great ambiguity of many political processes and outcomes make this a domain of social life that is especially prone to increasing returns processes.

The final section considers what these arguments can contribute to political analysis. They provide an important caution against a too easy conclusion of the inevitability, "naturalness," or functionality of observed outcomes. Given the ubiquity of claims about efficient or functional elements in politics, this alone would be an important corrective. More significant, increasing returns arguments justify efforts to stretch the temporal horizons of political analysis. They can redirect the questions political scientists ask, which will contribute to a richer appreciation of the centrality of historical processes in generating variation in political life. They can also direct attention toward particular variables and suggest promising hypotheses about the sources of both political stability and political change in certain common political settings. For instance, increasing returns arguments highlight the need to consider hypotheses based on temporal ordering—the possibility that the particular sequencing of events or processes may be a key part of the explanation for divergent outcomes. Finally, grasping the implications of widespread path dependence can help orient political scientists to a realistic, which is to say modest, set of aspirations regarding the possibilities for achieving parsimony and predictability in the study of politics.

PATH DEPENDENCE AND INCREASING RETURNS

Analysts are increasingly inclined to invoke the concept of path dependence, but clear definitions are rare. In practice, usage tends to fluctuate between a broader and narrower conception. In the broader version, path dependence refers to the causal relevance of preceding stages in a temporal sequence. William Sewell (1996, 262-3), for instance, suggests path dependence means "that what happened at an earlier point in time will affect the possible outcomes of a sequence of events occurring at a later point in time." This usage may entail only the loose and not very helpful assertion that "history matters," although it may also be presented with more rigor. To take an example offered by Andrew Abbott (1983, 131), the contemporary significance of a group's organization of 40% of its potential membership depends greatly on whether that membership used to be 100% or 10%. Note that Sewell's definition involves no necessary suggestion that a particular path is difficult to exit. Rather, the claim is that

we cannot understand the significance of a particular social variable without understanding "how it got there"—the path it took. Previous events in a sequence influence outcomes and trajectories but not necessarily by inducing further movement in the same direction. Indeed, the path may matter precisely because it tends to provoke a reaction in some other direction.

An alternative, narrower definition has been suggested by Margaret Levi (1997, 28):

Path dependence has to mean, if it is to mean anything, that once a country or region has started down a track, the costs of reversal are very high. There will be other choice points, but the entrenchments of certain institutional arrangements obstruct an easy reversal of the initial choice. Perhaps the better metaphor is a tree, rather than a path. From the same trunk, there are many different branches and smaller branches. Although it is possible to turn around or to clamber from one to the other—and essential if the chosen branch dies—the branch on which a climber begins is the one she tends to follow.

This conception of path dependence, in which preceding steps in a particular direction induce further movement in the same direction, is well captured by the idea of increasing returns. In an increasing returns process, the probability of further steps along the same path increases with each move down that path. This is because the *relative* benefits of the current activity compared with other possible options increase over time. To put it a different way, the costs of exit—of switching to some previously plausible alternative—rise. Increasing returns processes can also be described as self-reinforcing or positive feedback processes.

We face, then, a choice between a broader and a narrower conception of path dependence. Frequently, authors are not explicit about which of these two meanings they intend. To establish greater clarity, this essay employs the term in the narrower sense, that is, social processes that exhibit increasing returns. The fuzziness that has marked the use of this concept in social science suggests that the greater range offered by the broader definition has come at a high price in analytical clarity. Path dependence has been a victim of what Sartori (1970) called concept stretching. Different types of temporally linked sequences are generated in different ways and have different implications (Abbott 1983, 1990; Pierson n.d.b). These distinctive kinds of social processes, which have been bundled together, must be disentangled and systematically explored. Limiting the concept of path dependence to self-reinforcing processes in no way precludes the investigation of other ways in which sequences can matter in explaining social outcomes. It does encourage clear argument about distinct claims.1

¹ Another strategy would be to use a broader conception of path dependence and then distinguish subtypes, exploring how these are generated in different ways, with different consequences (Mahoney n.d.). Because path dependence is often invoked without further clarification, however, this option seems more problematic. Ultimately, such definitional disputes remain intractable. What is critical is that researchers be clear and consistent about what they mean when they employ the concept and recognize the importance of differentiating among distinct processes.

However such issues of concept formation are ultimately resolved, there are two compelling reasons for focusing special attention on processes that exhibit increasing returns. First, such processes characterize many important parts of the social world. Second, social scientists are developing theory that makes the investigation of the causes and consequences of increasing returns a particularly promising area of inquiry. These two reasons are developed in later sections of this essay.

The basic logic of increasing returns processes can be captured in a simple mathematical illustration.² Imagine a very large urn containing two balls, one black, one red. Remove one ball, and then return it to the urn, accompanied by an additional ball of the same color. Repeat this process until the urn fills up. What can we say about the eventual distribution of colored balls in the urn? Or about a series of trials in which we fill the urn and then start over again one hundred times?

- In each individual trial we have no idea what the eventual ratio of red to black balls will be; it could be 99.9% red, or 0.01% red, or anything in between. If we were to run 100 trials, we would probably get 100 different outcomes.
- In any particular trial, the ratio will eventually reach an equilibrium. Later draws in a series contribute only minutely to the distribution of balls in the urn. Thus, the distribution settles down onto a stable outcome.
- Sequence is thus crucial. Early draws in each trial, which have a considerable random element, have a powerful effect on which of the possible equilibria will actually emerge.

Mathematicians call this a Polya urn process. Its characteristic qualities stem from the fact that an element of chance (or accident) is combined with a decision rule that links current probabilities to the outcomes of preceding (partly random) sequences.³ Polya urn processes exhibit increasing returns or positive feedback. Each step along a particular path produces consequences which make that path more attractive for the next round. As such effects begin to accumulate, they generate a powerful virtuous (or vicious) cycle of self-reinforcing activity.

Increasing returns processes have quite intriguing characteristics, which Arthur (1994, 112-3) has summarized as follows.

 Unpredictability. Because early events have a large effect and are partly random, many outcomes may

² The following discussion relies heavily on Arthur 1994, a collection of his ground-breaking essays on increasing returns and path dependence.

- be possible. We cannot predict ahead of time which of these possible end-states will be reached.
- 2. Inflexibility. The farther into the process we are, the harder it becomes to shift from one path to another. In applications to technology, a given subsidy to a particular technique will be more likely to shift the ultimate outcome if it occurs early rather than late. Sufficient movement down a particular path may eventually lock in one solution.⁴
- Nonergodicity. Accidental events early in a sequence do not cancel out. They cannot be treated (which is to say, ignored) as "noise," because they feed back into future choices. Small events are remembered.
- 4. Potential path inefficiency. In the long-run, the outcome that becomes locked in may generate lower pay-offs than a forgone alternative would have.

To this one can add a general point of particular interest to social scientists: These are processes in which sequencing is critical. Earlier events matter much more than later ones, and hence different sequences may produce different outcomes. In these processes, history matters.

If these characteristics are common in politics, then they carry major implications, both for the kinds of questions we should ask and the kinds of answers we should expect to find. Most important, they suggest the need to focus on the temporal dimensions of social processes. In searching for explanation, we need to think about causes and effects that are often separated in time, rather than focus exclusively on synchronic explanations (Harsanyi 1960; Stinchcombe 1968). Exploring these implications requires a review of recent work on increasing returns in economics.

INCREASING RETURNS ARGUMENTS IN ECONOMICS

Economics has traditionally focused on the search for unique equilibria. The goal is attractive because it suggests a world of potential predictability and efficiency. Given knowledge of existing factor endowments and preferences, equilibrium analysis will point to a single optimal outcome. Moreover, because economists assume a context of decreasing marginal returns, this goal is potentially achievable. With decreasing returns, economic actions will engender negative feed-

³ This case depicts a specific type of increasing returns process, in which the probability of a particular draw precisely equals the ratio between the two alternatives in the existing population. Arthur (1994) shows that many of the features of this case have a greater range of application, but not all of them. It is easy to model path dependent processes with only two equilibria (e.g., Hill 1997), which probably comes closer to capturing the essence of many path dependent processes in the social world.

⁴ This emerging stability represents a critical distinction between increasing returns processes and chaotic processes, which may generate no equilibrium. For an interesting discussion of this quite different framework, with applications to politics, see Fearon 1996. ⁵ Some social scientists, such as Stephen J. Gould, also have been drawn to arguments about path dependence, critical junctures, and punctuated equilibria in evolutionary biology (see especially Krasner 1989; Spruyt 1994). Without denying the relevance of this literature, I find it a less useful point of departure than the economists' focus on increasing returns. Most aspects of politics lack anything like the mechanism of natural selection that drives Darwinian theory (international relations and certain characteristics of electoral systems constitute important exceptions). Furthermore, socially created constructs of norms and formal institutions have no real analog m evolutionary theory. These constructs, however, are crucial features of politics and, as we shall see, are a critical element in social processes subject to increasing returns.

back, which will lead to a predictable equilibrium. A sharp rise in oil prices prompts increased conservation, exploration, and exploitation of other sources of energy, which will lead to a fall in oil prices. Each step away from equilibrium is more difficult than the one before. As Arthur (1994, 1) summarizes, negative "feedback tends to stabilize the economy because any major changes will be offset by the very reactions they generate.... The equilibrium marks the 'best' outcome possible under the circumstances: the most efficient use and allocation of resources."

During the past fifteen years, however, this decreasing returns tradition has faced a mounting challenge. Economists have exhibited a growing interest in the idea of increasing returns. On a wide range of subjects—including the spatial location of production, the development of international trade, the causes of economic growth, and the emergence of new technologies—path dependence arguments have become prevalent. The ideas developed in this research are not entirely new, but they have been embraced and developed by prominent mainstream economists. This work has received considerable attention in leading journals. Douglass North, who places great emphasis on such arguments in his analysis of the development of modern capitalism, was awarded the Nobel Prize for economics.

The study of technology has provided the most fertile ground for arguments based on increasing returns. As Arthur (1994) and David (1985) have stressed, under conditions often present in complex, knowledge-intensive sectors, a particular technology may achieve a decisive advantage over competitors. although it is not necessarily the most efficient alternative in the long run. This occurs because each technology generates higher payoffs for each user as it becomes more prevalent. When a new technology is subject to increasing returns, being the fastest out of the gate (if only for reasons of historical accident) becomes critical. With increasing returns, actors have strong incentives to focus on a single alternative and to continue down a specific path once initial steps are taken in that direction. Once an initial advantage is gained, positive feedback effects may lock in this technology, and competitors are excluded. Path dependence arguments have been applied to the development of the "QWERTY" typewriter keyboard, the triumph of the light-water nuclear reactor in the United States, the battles between Betamax and VHS video recorders and between DOS-based and Macintosh computers, early automobile designs, and competing standards for electric current.6

Not all technologies, however, are prone to increasing returns. Arthur (1994) addresses not only the characteristics of such processes but also the conditions that give rise to them. Understanding these conditions

is essential, as we shall see, because analytically similar circumstances occur frequently in the world of politics. Arthur's characteristics provide a foundation for developing hypotheses about when increasing returns processes are likely to operate in the social world.

Arthur (1994, 112) argues that four features of a technology and its social context generate increasing returns.

- Large set-up or fixed costs. These create a high pay-off for further investments in a given technology. With large production runs, fixed costs can be spread over more output, which will lead to lower unit costs. When set-up or fixed costs are high, individuals and organizations have a strong incentive to identify and stick with a single option.
- 2. Learning effects. Knowledge gained in the operation of complex systems also leads to higher returns from continuing use. With repetition, individuals learn how to use products more effectively, and their experiences are likely to spur further innovations in the product or in related activities.
- 3. Coordination effects. These occur when the benefits an individual receives from a particular activity increase as others adopt the same option. If technologies embody positive network externalities, then a given technology will become more attractive as more people use it. Coordination effects are especially significant when a technology has to be compatible with a linked infrastructure (e.g., software with hardware; automobiles with an infrastructure of roads, repair facilities, and fueling stations). Increased use of a technology encourages investments in the linked infrastructure, which in turn attracts still more users to the technology.
- 4. Adaptive expectations. If options that fail to win broad acceptance will have drawbacks later on, then individuals may feel a need to "pick the right horse." Although the dynamic here is related to coordination effects, it derives from the self-fulfilling character of expectations. Projections about future aggregate use patterns lead individuals to adapt their actions in ways that help make those expectations come true.

This discussion of technology is important primarily because it clarifies a set of relationships characteristic of many social interactions. New social initiatives—such as the creation of organizations or institutions—usually entail considerable start-up costs; individuals, as well as organizations, learn by doing; the benefits of our individual activities or those of an organization are often enhanced if they are coordinated or "fit" with the activities of other actors or organizations; it is frequently important to bet on the right horse, so we adapt our actions in light of our expectations about the actions of others.

Although arguments about technology are probably the best known, economists have applied similar analyses of increasing returns processes in a striking range of economic contexts. Both Krugman (1991) and Arthur (1994, 49–67) point to the role of increasing returns in the spatial location of production. Given the

⁶ Many of these examples have been contested by critics who deny the empirical claim that superior technologies lost out. Since these criticisms raise broader issues about the usefulness of increasing returns arguments, I will postpone discussion until the end of this section.

importance of physical proximity in many aspects of economic life, agglomeration effects are widespread. That is, initial centers of economic activity may act like a magnet and influence the locational decisions and investments of other economic actors. Established firms attract suppliers, skilled labor, specialized financial and legal services, and appropriate physical infrastructure. The concentration of these factors may in turn make the particular location attractive to other firms that produce similar goods. So do social networks, which allow for easy exchange of information and expertise. Increasing returns arguments help explain the prevalence of pockets of specialized economic activity, from Silicon Valley to the high-end textile manufacturers of northern Italy. Krugman (1991, 80) concludes: "If there is one single area of economics in which path dependence is unmistakable. it is in economic geography—the location of production in space. The long shadow cast by history over location is apparent at all scales, from the smallest to the largest—from the cluster of costume jewelry firms in Providence to the concentration of 60 million people in the Northeast Corridor."

These claims closely parallel recent analyses of international trade, an area in which arguments about increasing returns have gained wide acceptance. Researchers began by focusing on economic trends that appeared anomalous from the perspective of traditional trade theory—most notably, the explosion of intraindustry trade after World War II (Krugman 1996). If comparative advantage results from "natural" features of different countries, then one would expect most trade to occur between quite different countries, such as North-South trade of manufactured goods for raw materials. Yet, most trade is North-North, including extensive exchanges within particular industries. This pattern suggests a puzzle: Why have broadly similar countries developed highly specialized niche comparative advantages?

Increasing returns provide an answer. Knowledgeintensive sectors are prone to positive feedback. Countries that gain a lead in a particular field, for whatever reason, are likely to consolidate that lead over time. The result is a high degree of specialization. Even countries with similar initial endowments develop divergent areas of economic strength. Comparative advantage is not simply given, it is often created through a sequence of events over time.

It is worth noting that this research on trade has been used to derive some controversial policy implications. If first-mover advantages are significant, then free trade may not be an optimal policy for a country whose trade partners are willing to subsidize emerging sectors. Under certain (restricted) conditions, a policy of picking winners may make economic sense (Krugman 1996; Tyson 1993). There remains considerable dispute about the significance of such opportunities for strategic intervention. Krugman, for instance, maintains that they will appear relatively infrequently, not so much because path dependence is rare, but because governments will not be able to identify winners ex ante. Whatever the appropriate policy implications

may be, however, the relevance of increasing returns processes to the economics of trade is now widely accepted.⁷

Economists also have applied increasing returns arguments to economic change more broadly. The most prominent development in recent discussions of economic growth centers on "endogenous growth" theory (Romer 1986, 1990). Economists in the 1980s became puzzled by growth rates (notably in developed countries after World War II) far greater than could be explained by measured increases in inputs of capital and labor. Romer and others argue that increasing returns associated with economic applications of knowledge help account for the anomaly. Unlike capital and labor, many aspects of knowledge are nonrival—their use in one firm does not prevent their use in another. A single gain in knowledge can be applied in many settings and can lead to dramatic improvements in productivity. Economic growth generates the positive feedback that defines increasing returns processes. A somewhat different analysis of growth based on increasing returns emphasizes the importance of complementarities (Milgrom and Roberts 1990). Various economic activities (e.g., in information technology) are complementary to other related activities. Improvements in a core activity can spill over by improving related parts of the economy (lowering costs or increasing productivity). These improvements in turn may increase the attractiveness of the core activity.

Economists are now applying increasing returns arguments to a wide range of important economic phenomena, but Douglass North's application to issues of institutional emergence and change is perhaps most important for students of politics. North (1990a, 95) argues that all the features identified by Arthur in investigations of increasing returns in technology can be applied to institutions. In contexts of complex social interdependence, new institutions often entail high fixed or start-up costs, and they involve considerable learning effects, coordination effects, and adaptive expectations. Established institutions generate powerful inducements that reinforce their own stability and further development.

North emphasizes that not just single institutions are subject to increasing returns. Institutional arrangements induce complementary organizational forms, which in turn may generate new complementary institutions. For social scientists interested in paths of development, the key issue is often what North calls "the interdependent web of an institutional matrix." This matrix, he emphasizes, "produces massive increasing returns" (North 1990a, 95). Path dependent processes will often be most powerful not at the level of individual organizations or institutions but at a more macro level that involves complementary configurations of organizations and institutions (Hall and Soskice 2000; Katznelson 1997).

⁷ As Krugman (1996, 109-10) notes, in the American Economic Association's classification system for journal articles, one now finds "models of trade with increasing returns and imperfect competition" alongside the category for "conventional trade models."

This argument provides the core to North's sweeping reinterpretation of economic history. The central puzzle motivating North's inquiry is the limited convergence of economic performance across countries over time. Neoclassical theory suggests that laggard countries should readily adopt the practices of high performers, which would induce fairly rapid convergence, but this does not happen. According to North, path dependent development of institutional matrices explains the anomaly of continued divergence in economic performance. Once in place, institutions are hard to change, and they have a tremendous effect on the possibilities for generating sustained economic growth. Individuals and organizations adapt to existing institutions. If the institutional matrix creates incentives for piracy, North observes, then people will invest in becoming good pirates. When institutions fail to provide incentives to be economically productive, there is unlikely to be much economic growth.

For political scientists, North's insight is crucial for two reasons. First, he highlights the parallels between characteristics of technology and certain characteristics of social interactions. In this context, it is worth noting that Arthur's arguments about technology are not really about the technology itself but about the characteristics of a technology in interaction with certain qualities of related social activity. Second, North rightly emphasizes that institutional development is subject to increasing returns. Indeed, it is the role of path dependence in explaining patterns of institutional emergence, persistence, and change that may be of greatest significance for political scientists.

The dialogue surrounding increasing returns in economics is the impassioned discourse of an emerging paradigm. Economists talk of "new" growth theory, "new" trade theory, and so on—all based on arguments involving increasing returns. Yet, despite the prevalence of such arguments and the intellectual excitement associated with them, there are excellent reasons to believe that the range of application should be at least as wide in politics as in economics. To understand why, it is helpful to consider the major objections to increasing returns arguments that have recently surfaced in economics. The discussion will clarify the sources of path dependence and identify social mechanisms that might offset such processes. This clarification provides a useful analytical bridge to an investigation of path dependent processes in politics.

In a forceful critique, Liebowitz and Margolis (1995) raise some tough questions about the literature on increasing returns. Two aspects of their argument are relevant here. They emphasize that only "remediable" path dependence is really of theoretical significance, and market mechanisms ensure that remediable path dependence is rare. I will take up each argument in turn.⁸ Following Williamson (1993), Liebowitz and

Margolis (1995) distinguish remediable and nonremediable path dependence. The latter occurs if there are no feasible improvements in the path, either now or in the past. Nonremediable path dependence "stipulates that intertemporal effects propagate error" (p. 207). With hindsight, we wish that some other alternative had been chosen. Yet, Liebowitz and Margolis question whether this type of path dependence has profound implications. If we acted as best we could with the information available at the time, then the mistake was unavoidable, and we cannot reasonably describe the outcome as inefficient. Liebowitz and Margolis argue that the only kind of path dependence with major ramifications is path dependence that is potentially remediable.

Is their dismissal of nonremediable path dependence convincing? As Williamson (1993) notes, for policy purposes remediability is likely to be an appropriate standard. Recognizing the existence of path dependence may not help policymakers much if they do not know how to identify it ex ante. But this objection loses its force if our purpose is instead to understand—perhaps ex post—why aspects of societies move in particular directions and the consequences of such movements. And, of course, it is precisely these questions about causality that are the central preoccupation of most social scientists.

The second part of the Liebowitz and Margolis analysis is the claim that remediable path dependence is rare. Their argument is straightforward. If one of two options is superior in the long run but not in the short run, then market arrangements will generally assure the adoption of the superior path. The ability of private actors to capture the returns from long-term investments prevents bad choices. Institutions of property rights, provisions for patents, and extensive capital markets mean that options with low short-run pay-offs will nonetheless receive the support they deserve. Economic actors, in short, calculate in the shadow of the future and are thus unlikely to indulge in myopic, short-term maximizing behavior at their own long-term expense.

This argument has considerable merit, 10 but how much merit depends on the strength of these mechanisms for overcoming short-term thinking or free-riding. Although Liebowitz and Margolis are more than a little complacent about the capacity of these various market mechanisms, it is wise to leave those issues to economists. Two objections, however, are critically important. First, arguments about the far-sightedness of markets seem to apply to only some types of path dependence in the economy. The Liebowitz and Margolis critique focuses on the decisions of firms to invest in particular technologies or products. In most of the illustrations discussed earlier (e.g., spatial agglomorations, trade specialization, endoge-

⁸ Note that the Liebowtiz and Margolis critique depends on both parts of the argument being true. The significance of path dependence for social scientists can be sustained if either the relevance of nonremediable path dependence or the prevalence of remediable path dependence can be sustained.

⁹ As noted before, precisely for this reason Krugman and others question those who make broad claims about the implications of increasing returns arguments for trade policy.

¹⁰ Indeed, Arthur (1994, 28, fn 11) explicitly recognizes this possibility, although as far as I know he does not systematically pursue the implications.

nous growth), however, many of the benefits of increasing returns are external to individual firms and cannot be fully captured by individual investors and entrepreneurs. Thus, the mechanisms identified by Liebowitz and Margolis are unlikely to ensure that the best long-term outcome will be selected.

Perhaps more important, the Leibowitz and Margolis (1995) argument has little relevance to the development of institutions, which are also subject to increasing returns. Private actors cannot obtain patents or venture capital to capture the long-term economic gains from constructing key economic institutions. Indeed, the Leibowitz and Margolis argument simply assumes the presence of institutions that support market mechanisms. Also, their argument does not seem to have much relevance for North's argument about the presence in particular polities of networks or matrices of institutions and organizations. The fact that they do not even cite North's work is telling. North maintains that path dependent processes of institutional development are crucial to the evolution of particular market economies. Far-sighted financial markets are of limited help in triggering such institutional development; to a large extent, they are its product.

The failure of Leibowitz and Margolis to address issues of institutional development in economies points to a more fundamental objection. Even if one accepts their analysis regarding the economic sphere, their arguments still have limited relevance for political scientists. However strong market mechanisms for "far-sightedness" may be, they are almost certainly far weaker in politics. I explain why in the next section.

MOVING FROM ECONOMICS TO POLITICS: THE APPLICABILITY OF INCREASING RETURNS ARGUMENTS

Microeconomic theory illuminates important features of the political landscape in fields ranging from the study of party competition, to the formation of interest groups and social movements, to voting and legislative behavior. The value of economists' theoretical exports is greatly enhanced, however, if the political science importers take careful account of the distinctive features of the "local" environment. As Terry Moe (1990, 119) states in a related context: "The real problem is to try to identify those essential features of politics that might serve as a foundation for theory, a foundation that can take advantage of the new economics without being overwhelmed or misdirected by it." Arguments drawn from economics must be sensitive to the quite different nature of the political world (Lindblom 1977; Moe 1984, 1990; North 1990b).

Politics differs from economics in many ways. The key is to specify which aspects are most relevant to an investigation of the sources and consequences of path dependence. Following a brief summary of the distinctive tasks of the political arena, this discussion is divided into two parts. The first considers four prominent and interconnected aspects of politics that make this realm of social life conducive to increasing returns processes: (1) the central role of collective action; (2)

the high density of institutions; (3) the possibilities for using political authority to enhance asymmetries of power; and (4) its intrinsic complexity and opacity. After briefly explicating each, I will discuss their relevance to path dependence. Each of these features makes increasing returns processes prevalent in politics.

Second, I explain why the ameliorative mechanisms that Liebowitz and Margolis identify in economic systems are often ineffective in offsetting path dependence in politics. Three characteristics of politics change the picture considerably: the absence or weakness of efficiency-enhancing mechanisms of competition and learning; the shorter time horizons of political actors; and the strong status quo bias generally built into political institutions. Each of these features makes increasing returns processes in politics particularly intense. They increase the difficulty of reversing the course down which actors have started. Increasing returns processes are now central to economic theory and the argument here is that these dynamics will be very widespread and often more difficult to reverse in politics.

For my purposes, the fundamental feature of politics is its preoccupation with the provision of public goods.¹¹ Such goods are distinguished by jointness of supply (the production costs for the good are unaffected or only modestly affected by the number of those consuming it) and nonexcludability (it is very costly or impossible to limit consumption to those who have paid for a good). These features, which are extremely widespread in modern life, make public goods—from national defense to environmental protection—difficult to provide through markets. Nonexcludability creates free-riding incentives, since individuals will receive the benefits of a public good whether or not they contribute to its production. Jointness of supply means that private markets will underproduce the good in question, since private actors tend to consider only the benefits to themselves.

These characteristics of public goods help explain why the central features of political systems are compulsory rather than voluntary. The exercise of authority, generally combined with a complex array of complementary institutions designed to circumscribe and legitimate that authority, is necessary to generate collective provision. Legally binding rules are not just a foundation for political activity (like property rights in the economy). They are instead the very essence of politics (Lindblom 1977; Moe 1990). This key quality of politics has a number of repercussions for the character of political life, each of which is relevant for an assessment of tendencies toward path dependence.

The Collective Nature of Politics

A quick contrast with economic markets can highlight the prevalence of collective action in politics. Suppose

¹¹ In most cases, the goods in question are not "pure" public goods—a fact that complicates the analysis but does not alter my basic claims. For discussions, see Mueller 1989, chap. 2, and Cornes and Sandler 1996.

you work for a firm with an annoying boss and bad pay. You have a clear option: Seek work elsewhere, either at one of a large number of other firms or by setting up business on your own. Your ability to move depends on the state of the labor market, but the existence of competitive options sets clear limits on how annoying your boss can afford to be and on how bad the pay can get.

Or suppose you invent a great new product. Assuming that you can get financial backing (which you should be able to do—it is a great idea, and the market generates a ready supply of venture capitalists), your prospects are good. Nothing stops you from going into business or selling the idea to someone. Either way, the new, superior product gets to see the light of day, and you reap considerable benefits from your innovation.

The setting of consumers, at least in the textbook case, is similarly atomistic. My decisions are essentially independent of my expectations regarding the choices of other consumers.¹² There is no need for explicit attempts to coordinate behavior; the market simply aggregates the isolated decisions of individuals.

These highly stylized examples illustrate the flexibility, fluidity, and atomization of economic markets. In contrast, political "markets" are generally far from flexible and fluid. In politics, the consequences of my actions are highly dependent upon the actions of others. What I get depends not just on what I do, but (mostly) on what others do. Following Olson's (1965) path-breaking work, students of politics have long recognized the "logic of collective action." Most of the "goods" produced in politics are public goods; it is difficult to limit their consumption to those who helped provide them. As a result, individuals will have a strong tendency to free-ride. Creating conditions favorable to collective action is a principal issue in political life.

The problem is not limited to the fact that the public sector produces public goods. Given the reliance of politics on mechanisms of collective decision backed by authority, laws themselves have the character of public goods for those who benefit from them. In the words of Marwell and Oliver (1993, 42), "influencing government policy almost always has very high jointness of supply." These circumstances generate major collective action problems.

There is another reason political action frequently requires coordination. Many of the goals pursued by political actors have a "lumpy" or "winner-take-all" quality (politicians seeking reelection, coup plotters, and lobbyists either win or lose; legislation either passes or is rejected). Unlike economic markets, in which there usually is room for many firms, in politics finishing second may not count for much. Indeed—the Menshiviks in 1917 come to mind—it can be extremely problematic. Again, the effectiveness of my actions

depends heavily on the actions of others. This is less true of some aspects of politics—such as answering an opinion poll question or voting—than others. Even in voting, however, the lumpiness of election outcomes (in the absence of a pure system of proportional representation) means that the actions of a person who does not want to "waste" her vote may well turn on what she expects others to do.

A crucial feature of most collective action in politics is the absence of a linear relationship between effort and effect. Instead, collective action frequently involves many of the qualities conducive to positive feedback (Marwell and Oliver 1993). A central reason is the prevalence of adaptive expectations. When picking the wrong horse may have very high costs, actors must constantly adjust their behavior in the light of how they expect others to act. Whether you put energy into developing a new party, or join a potential coalition, or provide resources to an interest group may depend to a considerable degree on your confidence that a large number of other people will do the same. In addition, many types of collective action involve high start-up costs, which reflects the fact that considerable resources (material or cultural) need to be expended on organizing before the group becomes self-financing.

That collective action processes in politics are very often subject to increasing returns explains why social scientists are often struck by the considerable stability of patterns of political mobilization over time. Lipset and Rokkan's (1967) work on political parties in Europe exemplifies this dynamic: Key historical junctures produced major political cleavages. These political divisions became organized into political parties. Once they have surmounted initial start-up costs and fueled processes of adaptive expectations, these parties are reproduced through time, which generates "frozen" party systems.

Recent work by Skocpol (1999) on extensive voluntary associations in the United States provides additional strong evidence of the organizational persistence that can result from positive feedback. Skocpol identified all such organizations that had ever enrolled more than 1% of the American population (or half that amount for single-gender groups) and tracked them over time. The results, which cover 58 groups since the 1830s, reveal striking organizational continuities. Although some crossed the 1% threshold only for a relatively short period, 26 remain above it today. Of these, 16 had reached the 1% mark by the 1940s, and a number of them stretch back much farther. A large number have fallen from the list, but they managed to stay on it for many decades. Among the 40 organizations founded before 1900, 19 stayed above the 1% mark for at least five decades. Ten of the 40 are still above that threshold, a century or more after their founding.¹³ In short, despite massive social, economic,

¹² This represents a critical difference between economics and politics, but a number of important qualifications need to be made. For instance, consumption often involves significant externalities, which make consumer choices interdependent. As already noted, conditions of independent consumption often do not apply to high-tech products, which frequently involve network externalities. For a good discussion of some of these complications, see Hirsch 1977.

¹³ It should be emphasized that this evidence understates organizational persistence, since many groups that fall below the demanding 1% threshold nonetheless continue to have a very large membership. Also, they may have existed as quite large organizations for long periods before initially crossing the threshold.

and political changes over time, self-reinforcing dynamics associated with collective action processes mean that organizations have a strong tendency to persist once they are institutionalized.

The Institutional Density of Politics

As much recent work in political science stresses, efforts to coordinate actors in the pursuit of public goods often require the construction of formal institutions. Once established, these institutional constraints can apply to all—those who do not approve as well as those who do-and they are backed up, ultimately, by force. The exit option, so central to the workings of the market, is often unavailable (or prohibitively costly) to actors who feel poorly served by existing political arrangements. In politics, institutional constraints are ubiquitous. Politics involves struggles over the authority to establish, enforce, and change the rules governing social action in a particular territory. In short, much of politics is based on authority rather than exchange. Both formal institutions (such as constitutional arrangements) and public policies place extensive, legally binding constraints on behavior.

Although unorthodox, the inclusion of public policies as well as formal institutions in this formulation is important (Pierson 1993). Policies are generally more easily altered than the constitutive rules of formal institutions, but they are nevertheless extremely prominent constraining features of the political environment. Policies, grounded in law and backed by the coercive power of the state, signal to actors what has to be done and what cannot be done, and they establish many of the rewards and penalties associated with particular activities. Most policies are remarkably durable (Rose 1990). Especially in modern societies, extensive policy arrangements fundamentally shape the incentives and resources of political actors.

That such institutions are prone to increasing returns is implicit in much recent research on institutions. Scholars emphasize how institutions can help actors overcome various dilemmas arising from collective choice situations—especially the need to coordinate their behavior by disciplining expectations about the behavior of others. What is absent or downplayed, however, is a recognition that these characteristics render processes of institutional development path dependent.

As already discussed, North highlights how institutions induce self-reinforcing processes that make reversals of course increasingly unattractive over time. In contexts of complex social interdependence, new institutions and policies are costly to create and often generate learning effects, coordination effects, and adaptive expectations. Institutions and policies may encourage individuals and organizations to invest in specialized skills, deepen relationships with other individuals and organizations, and develop particular political and social identities. ¹⁴ These activities increase

the attractiveness of existing institutional arrangements relative to hypothetical alternatives. As social actors make commitments based on existing institutions and policies, their cost of exit from established arrangements generally rises dramatically.

Political Authority and Power Asymmetries

In the famous community power debate of the 1960s and 1970s, Bachrach and Baratz (1962) and Lukes (1974) argued persuasively that power asymmetries are often hidden from view; where power is most unequal, it often does not need to be employed openly. Pluralist critics essentially countered that a systematic evaluation of such claims was impossible (Polsby 1963; Wolfinger 1971). Although he does not frame the issue quite this way, Gaventa (1980) demonstrates that power asymmetries can reflect the operation of positive feedback processes over substantial periods. Increasing returns processes can transform a situation of relatively balanced conflict, in which one set of actors must openly impose its preferences on another set ("the first face of power"), into one in which power relations become so uneven that anticipated reactions ("the second face of power") and ideological manipulation ("the third face") make open political conflict unnecessary. Thus, positive feedback over time simultaneously increases power asymmetries and renders power relations less visible.

The allocation of political authority to particular actors is a key source of this kind of positive feedback. Indeed, this represents a source of path dependence quite distinct from those discussed by Arthur and North. When certain actors are in a position to impose rules on others, the employment of power may be self-reinforcing (Mahoney 1999). Actors may use political authority to generate changes in the rules of the game (both formal institutions and various public policies) designed to enhance their power. Relatively small disparities in political resources among contending groups may widen dramatically over time as positive feedback sets in.

The Complexity and Opacity of Politics

Economic theory is built in large part around the useful and plausible assumption that actors seek to optimize and are relatively good at it. Firms operate to maximize profits. The metric for good performance is relatively simple and transparent. Prices send strong signals that facilitate the analysis of how various features of the economic environment affect firm performance. Observable, unambiguous, and often quantifiable indicators exist for many of these features. Workers can

to mean previous outlays that cannot be recovered and should be regarded as irrelevant to current choices among options. The whole point of path dependence, however, is that these previous choices often are relevant to current action. In cases of increasing returns, social adaptations represent investments that yield continuing benefits. Actors may be locked into a current option because massive new investments may be required before some theoretically superior alternative generates a higher stream of benefits.

¹⁴ It is common to refer to such consequences as sunk costs. Although intuitive, this terminology is unfortunate. Economists use it

obtain fairly good information on the wages and working conditions on offer from different firms. Consumers, too, are reasonably adept at navigating most aspects of the economic world. Links between choices and outcomes are generally clear. Take a new job and your income rises; buy a car and your savings account balance shrinks. The quality of goods is usually evident in relatively short order, and repeated purchases allow consumers to sample alternatives.

Of course, one can add many complications to this simple picture of the economic realm. The market is often highly complex and confusing. Yet, the clarifying role of prices, the prevalence of repeated interactions, the absence of a need to coordinate many of one's economic decisions with those of other actors, and the presence of relatively short causal chains between choices and results greatly facilitate the efforts of economic actors to correct mistakes over time.

Politics is a far, far murkier environment (Moe 1990; North 1990b). It lacks anything like the measuring rod of price. Political actors pursue a range of goals. Furthermore, it is often very hard to observe or measure important aspects of political performance. And, if we believe that a system is not performing well, it is still more difficult to determine which elements in these highly complex systems are responsible and what adjustments would lead to better results. The reliance on elaborate procedures to handle collective choice situations in politics is inescapable, but it undermines transparency, that is, it greatly increases transaction costs (Cornes and Sandler 1996; Mueller 1989). The complexity of the goals of politics as well as the loose and diffuse links between actions and outcomes render politics inherently ambiguous.

Even if mistakes or failures in politics are apparent, improvement through trial-and-error processes is far from automatic. Many participants in politics (voters, members of interest groups) engage in activities only sporadically. Their tools of action are often crude, such as the blunt instrument of the vote, and their actions have consequences only when aggregated. There may be long lags and complex causal chains connecting these political actions to political outcomes. The result is that mistaken understandings often do not get corrected.

The point is not that learning never occurs in politics. Rather, learning is very difficult and cannot be assumed to occur. Instead, understandings of the political world should themselves be seen as susceptible to path dependence. Drawing on work in both cognitive psychology and organizational theory, researchers argue that actors who operate in a social context of high complexity and opacity are heavily biased in the way they filter information into existing "mental maps" (Arthur 1994; Denzau and North 1994). Confirming information tends to be incorporated, and disconfirming information is filtered out. Social interpretations of complex environments like politics are subject to positive feedback. The development of basic social understandings involves high start-up costs and learning effects; they are frequently shared with other social actors in ways that create network effects and adaptive expectations. The need to employ mental maps induces increasing returns. This is true both at the individual level and at the group level, as "communities of discourse" often come to share and reproduce a similar ideology (Wuthnow 1989).¹⁵

This recent work converges with the long-standing views of those who study political culture as well as the recent contributions of cognitive science. ¹⁶ Once established, basic outlooks on politics, ranging from ideologies to understandings of particular aspects of governments or orientations toward political groups or parties, are generally tenacious. They are path dependent. ¹⁷

There are, then, compelling reasons to believe that political life will often be marked by dynamics of increasing returns. Tendencies toward positive feedback characterize four processes central to political environments: collective action, institutional development, the exercise of authority, and social interpretation. In each case, there are reasons to anticipate that steps in a particular direction can trigger a self-reinforcing dynamic. This conclusion should be underlined. By itself, it suggests why increasing returns is a critical concept for those who seek to understand the sources of political stability and change. A recognition that self-reinforcing processes are significant is shaking up economics, and political scientists have at least as great a need to consider their implications.

There is also reason to believe that these effects in politics are often particularly intense. In the remainder of this section I consider why it is frequently more difficult to reverse course in politics than it would be in economics. Economists argue that the market provides two powerful mechanisms for exiting problematic paths: competition and learning. Competitive pressures in a market society mean that new organizations with more efficient structures will develop and eventually replace suboptimal organizations (Alchian 1950). Learning processes within firms also can lead to correction. According to Williamson (1993, 116–7), one can rely on

¹⁵ Wuthnow's (1989) subtle analysis of the comparative development of ideologies, with its emphasis on relatively brief periods of historical openness followed by processes that select and then institutionalize a particular track of ideological development, is broadly consistent with the framework suggested here

¹⁶ Consider the statement by Mannheim (1952, 298) in his famous cassay on generations: "It is of considerable importance for the formation of consciousness which experiences happen to make those all-important 'first impressions.' . . . Early impressions tend to coalesce into a natural view of the world."

¹⁷ Indeed, as marketers know well, path dependent cognitive effects are evident even in the less ambiguous world of consumption. This is why advertisers covet the attention of youngsters, who have yet to make definitive (and resilient) choices. A telling recent example is the marketing effort of the National Football League, which is alarmed by indications that youngsters are increasingly drawn to basketball and soccer. A former MTV executive now working on special events speaks the language of increasing returns: "It's all about getting a football... into a kid's hands as soon as you can. Six years old, if possible. You want to get a football in their hands before someone puts a basketball in their hands, or a hockey stick or a tennis racquet or a golf club" (Seabrook 1997, 47).

the "far-sighted propensity" or "rational spirit" that economics ascribes to economic actors.... Once the unanticipated consequences are understood, these effects will thereafter be anticipated and the ramifications can be folded back into the organizational design. Unwanted costs will then be mitigated and unanticipated benefits will be enhanced. Better economic performance will ordinarily result.

Of course, neither mechanism represents a guaranteed corrective in the context of increasing returns. Options that gain a head start will often reinforce themselves over time, even if they have serious shortcomings. What I wish to stress, however, is that Williamson's corrective mechanisms are even less effective when one shifts from firms in private markets to the world of political institutions (Moe 1984, 1990; Pierson n.d.a). This is clearest for mechanisms of competition. Political institutions rarely confront a dense environment of competing institutions that will instantly capitalize on inefficient performance, swooping in to carry off an institution's "customers" and drive it into bankruptcy. Models of competition may be helpful for understanding some important aspects of politics (such as international relations and elections), but there can be little doubt that political environments are typically more "permissive" than economic ones (Krasner 1989).

As just discussed, the complexity and ambiguity of politics create serious problems for learning arguments. It may be appropriate to argue that politics sometimes involves learning processes, in which responses to public problems proceed in a trial-and-error fashion (Hall 1993; Heclo 1974). There is little reason, however, to think that this acts as a selection mechanism with anything like the efficiency-enhancing properties of market competition in economics or Darwinian natural selection in biology. Because political reality is so complex and the tasks of evaluating public performance and determining which options would be superior are so formidable, such self-correction is often limited.

Even when learning does occur, it faces additional hurdles. In Williamson's (1993, 117) words, learning must still be "folded back into the organizational design." All the barriers to change in systems subject to increasing returns become relevant: Long movement down a particular path will increase the costs of switching to some previously forgone alternative. Furthermore, in politics the pursuit of such change faces two additional obstacles: the short time horizons of political actors and the strong status quo bias associated with the decision rules that govern most political institutions. These factors often make path dependent effects particularly intense in politics.

Time Horizons. A statement attributed to David Stockman, budget director during the Reagan administration, is unusual among political decision makers only for its candor. Asked by an adviser in 1981 to address Social Security's severe long-term financing problems, Stockman dismissed the idea out of hand. He explained that he had little interest in wasting "a lot

of political capital on some other guy's problem in [the year] 2010" (quoted in Greider 1982, 43).

Many of the implications of political decisions especially complex policy interventions or major institutional reforms—only play out in the long run. Yet, political actors, especially politicians, are often most interested in the short-term consequences of their actions; long-term effects tend to be heavily discounted. The principal reason is the logic of electoral politics. Because the decisions of voters are taken in the short run, elected officials generally employ a high discount rate. They will pay attention to long-term consequences only when these become politically salient or when they have little reason to fear short-term electoral retribution. As John Maynard Keynes once noted, in the long run we are all dead; politicians in democratic polities have special reason to take that message to heart.

Political scientists have paid limited attention to the issue of time horizons. An interesting literature is developing on "credible commitments"—the attempt of political actors to create arrangements that facilitate cooperation by lengthening time horizons (North 1993; North and Weingast 1989; Shepsle 1991). We know relatively little about the time horizons of different political actors or about the institutional arrangements conducive to lowering their discount rates (i.e., increasing the political relevance of the future). Recent research suggests that particular institutional designs (such as independent central banks), which empower particular kinds of political actors (e.g., bankers), may succeed in lengthening time horizons in politics.

In general, however, such mechanisms are less effective in politics than in economics. As noted, the marketplace possesses some strong mechanisms for lengthening time horizons—especially property rights and capital markets. The mechanisms in politics are generally far weaker. Monitoring political behavior over time is difficult because indicators of performance are typically so limited. It is no accident that much of the generally optimistic rational choice discussion of "credible commitments" in politics has focused on relatively transparent economic issues (e.g., budget deficits, monetary policy). In these instances, performance indicators are clear, and behavior is easy to monitor. Although these issues are clearly important, it must be stressed that for reasons already noted they are fundamentally atypical of the kinds of matters dealt with in politics. Not only is monitoring often exceptionally difficult in politics, but also the relatively rapid turnover of key positions makes it hard to hold actors accountable. Politics, in short, lacks the characteristic property rights that facilitate the linkage of actors' decisions over time in the economic sphere. In many cases, the long term is essentially beyond the political horizon. A statesman, Bismarck is said to have pronounced, is a politician who thinks about his grandchildren.

The different nature of time horizons in politics and in economics matters a lot. This can be seen by revisiting the Liebowitz and Margolis (1995) critique of path dependence. They properly point to key market institutions as a (partial) protection against (certain

kinds of) remediable path dependence. If it is believed that one option (say, Amazon.com) has greater longterm benefits, then investors should gravitate toward that option even if in the short term it will perform more poorly than an alternative. They argue that market mechanisms should allow the more efficient result

In politics the outcome may well be different. Assume that the crucial decision maker is a politician up for reelection in two years. In this context, effects after the election cycle may not count for much. A politician who focuses on the short-term pay-off will choose a different option from that of far-sighted economic investors. This difference in time horizons has profound consequences. If time-horizons tend to be short, then we can expect that long-term costs and benefits will have a limited effect on the chosen path. Furthermore, once on a particular path, political actors will generally have powerful incentives to stay on it. Switching costs are typically borne in the short run, and the benefits will generally only accrue in the long run, that is, to someone else.

The Status Quo Bias of Political Institutions. Political arrangements are unusually hard to change. In the economic realm, an individual with a new idea for a product need only secure the financing to put it on the market. If enough consumers (choosing independently) find it sufficiently appealing, the product will be a success. Change can be engineered through competition against existing products. Similarly, those with property rights over a firm are generally in a strong position to remake their organizations as they choose. Lines of authority are clear, and the relevant decision makers are likely to share the same broad goal of maximizing profits.

By contrast, the key features of political life—public policies and (especially) formal institutions—are change-resistant. Both are generally designed to be difficult to overturn for two broad reasons. First, those who design institutions and policies may wish to bind their successors. According to Moe (1990), this reflects the problem of "political uncertainty." Unlike economic actors, political actors must anticipate that their political rivals may soon control the reins of government. To protect themselves, they may create rules that make preexisting arrangements hard to reverse. As Moe (1990, 125) puts it, designers "do not want 'their' agencies to fall under the control of opponents. And given the way public authority is allocated and exer-

cised in a democracy, they often can only shut out their opponents by shutting themselves out too. In many cases, then, they purposely create structures that even they cannot control."

Second, in many cases, political actors also are compelled to bind themselves. The key insight of the "credible commitments" literature is that actors can often do better, in the short run as well as the long run, if they remove certain options from their future menu. The economy of a country will grow faster, for instance, if a monarch can credibly commit himself to refrain from expropriating an excessive amount of the hard-earned wealth of his subjects (North and Weingast 1989). This can be done if he accedes to parliamentary control over the power to tax.

To constrain themselves and others, designers create large obstacles to institutional change. The barriers to reform may be extremely high, such as unanimity requirements in the European Union and multiple supermajorities to alter the U.S. Constitution. Of course, these obstacles facilitate forms of cooperation and exchange that would otherwise be impossible. The relevant point here is that this status quo bias characteristic of political systems reinforces the already considerable difficulties of moving off an established path.²⁰ Combined with the lack of competitive mechanisms, the weakness of learning processes, and the short time horizons characteristic of politics, the bias means that increasing returns tendencies in political development are often particularly intense.

Politics differs from economics in many ways. Applying tools of economic analysis to politics is treacherous unless these differences are systematically considered. In the case of arguments about path dependence, attention to the character of politics suggests a striking result. The political world is unusually prone to increasing returns. Both the prevalence and intensity of increasing returns processes suggest that path dependence arguments offer important insights for understanding political dynamics.

¹⁸ These long-term effects will count if an actor with longer time horizons (such as an interest group) can make them relevant to politicians, such as through campaign contributions or votes. The question is whether such mechanisms are anywhere near as effective as the capital markets operative in the economic sphere. In my view, there are strong reasons to be skeptical, but it is an issue that deserves considerable attention.

¹⁹ This assumes that the actors involved care about what the government does after their faction loses an election. For reasons just noted (and as Moe observes) the problem of long-term political uncertainty is likely to be of greater concern for interest groups than for politicians.

²⁰ An important characteristic of political systems runs counter to this line of argument. Because politics is a powerful system for mobilizing coercive power, governments may at times be in a position to orchestrate a "jump" from one path to another. By employing sanctions, they can coordinate adjustments in a way that markets might never be able to achieve. For instance, the British government enacted a shift to the metric system that would have been difficult or impossible to engineer through the more atomistic mechanisms of the market. Governments are clearly capable on occasion of mobilizing resources for more dramatic changes in course. Such possibilities, however, should not be exaggerated. The metric example represents a modest instance of reversing path dependence. Switchmg costs were relatively low; the principal problem was one of coordination, of inducing everyone to make the switch at the same time. For this task, the authoritative rule-setting capacities of government are of great assistance. For reasons already discussed, it is much less evident that governments will generally be willing or able to engineer shifts to a different path when switching costs are high. Cases of fundamental or revolutionary reform in well-institutionalized political systems attract our attention precisely because they are

PATH DEPENDENCE AND THE STUDY OF POLITICS

To summarize briefly, in settings in which increasing returns or path dependent processes are at work, political life is likely to be marked by four features.

- Multiple equilibria. Under a set of initial conditions conducive to increasing returns, a number of outcomes—perhaps a wide range—are generally possible.
- Contingency. Relatively small events, if they occur at the right moment, can have large and enduring consequences.
- 3. A critical role for timing and sequencing. In increasing returns processes, when an event occurs may be crucial. Because earlier parts of a sequence matter much more than later parts, an event that happens "too late" may have no effect, although it might have been of great consequence if the timing had been different.
- Inertia. Once an increasing returns process is established, positive feedback may lead to a single equilibrium. This equilibrium will in turn be resistant to change.

There are also good reasons to think that increasing returns processes are widespread in politics, since they will be characteristic in institutional development, collective action, the exercise of authority, and the emergence of our understandings of the political world.

If increasing returns processes are prevalent in politics, then there are fundamental theoretical implications. We need to change both the kinds of questions we ask about politics and the kinds of answers that we generate. With respect to questions, the most important implication is the need to focus on branching points and on the specific factors that reinforce the paths established at those points. Students of comparative politics and American political development have long been interested in critical moments. The dynamics of increasing returns lay out what Collier and Collier (1991, 31) term the "mechanisms of reproduction," which carry and often amplify the effects of a critical juncture through time. Discussions of path dependence and critical junctures are often conflated, but as Hacker (1998) has emphasized, it is important to keep them distinct. Arguments about path dependence explain why particular historical junctures have lasting consequences. Yet, although claims about critical junctures seem to rest on assertions of increasing returns processes (otherwise it is not clear why the juncture is "critical"), the inverse does not hold. Path dependent arguments based on positive feedback suggest that not only "big" events have big consequences; little ones that happen at the right time can have major consequences as well.

A focus on increasing returns processes justifies a turn to history. At one level, of course, all social scientists agree that history matters. Current conditions, which influence current social outcomes, came into being in some way. Those earlier processes are relevant to a full understanding of contemporary social

events. Yet, the standard assumption is that for most purposes we may safely put such issues aside. Looking back leads to the familiar problem of infinite regress. An exploration of each preceding event leads to the conclusion that some other previous occurrence was also part of the chain of necessary events, and so on. Social scientists need to break through the seamlessness of history somewhere, and the present is as good a place to do so as any. Homans (1967, 92-3) compares the situation to that faced by navy minesweepers, who need to know the magnetic charge of a ship. Such a charge results from an infinite range of small factors accumulated over the ship's lifetime. For practical purposes, however, a simple expedient can be used: The current charge of the ship can be measured. If the task is to understand the ship's vulnerability to mines, one can simply cut through the Gordian knot of historical regress.21

For many purposes, this is an appropriate approach. Social scientists often have good reason to focus on synchronic causality—to try to understand how variations in current variables affect present social outcomes. When increasing returns processes are significant, however, such a strategy may be problematic. Increasing returns arguments rest on a conception of "historical causes" (Harsanyi 1960; Ikenberry 1994; Stinchcombe 1968, 103-18), that is, some original ordering moment triggered particular patterns, and the activity is continuously reproduced even though the original event no longer occurs. Under conditions of path dependence it is true that current circumstances in some sense "cause" current outcomes, but a focus on these simultaneous occurrences is highly misleading. It provides a "snapshot" explanation for what should be seen as a moving picture. The necessary conditions for current outcomes occurred in the past. The crucial object of study becomes the critical juncture or triggering events, which set development along a particular path, and the mechanisms of reproduction of the current path—which at first glance might seem commonplace or at least analytically uninteresting.

An awareness of increasing returns processes can change not only the questions we ask but also the answers we provide. Put differently, an understanding of increasing returns can be a fruitful source of hypotheses about the sources of social outcomes. One merit of increasing returns arguments is that they provide a plausible counter to functionalist explanations in political science, which often go unchallenged. Although not always explicitly stated, functionalist arguments are prevalent among political scientists. They are common, for instance, among those who emphasize the rational choices of individual actors that underlie political activity and the reasonably efficient nature of collective responses to social needs (Keohane 1984; Shepsle 1986; Weingast and Marshall 1988).

Functionalist arguments take the following form: Outcome X (e.g., an institution, policy, or organization) exists because it serves the function Y. In a world of purposive actors, it may indeed be the case that the

²¹ For a discussion of Homans's argument, see Knapp 1984, 43-5.

effects of an institution have something to do with an explanation for its emergence and persistence. Arguments about increasing returns, however, suggest the large dangers in any assumption that an institution arose because it serves some particularly useful purpose. Thinking in functionalist terms about an institution, policy, or social organization may be a good way to derive causal hypotheses, but functional accounts are far from being the only plausible ones. Many alternatives to the outcome in question might have been possible, and a dynamic of increasing returns may have locked in a particular option even though it originated by accident, or the factors that gave it an original advantage may have long since passed away. Rather than assume relative efficiency as an explanation, we have to go back and look. Thus, recognizing the possibility of path dependence necessarily draws social scientists to an investigation of history, if only to evaluate the validity of functionalist assertions.

More positively, an investigation of path dependence can provide a basis for developing important hypotheses about the sources of political stability and change. To repeat, Arthur's work on increasing returns is ground-breaking not simply because it describes the characteristics of these processes; it identifies conditions conducive to path dependence. The major ambition of this essay, building on North's work, is to begin the process of adapting these arguments to the study of politics. Doing so requires careful attention to the distinctive features of the political world, such as its intrinsic ambiguity, the prevalence of change-resistant institutions, the prominence of collective action problems, and the prospects for using political authority to amplify asymmetries of power. Not all aspects of political life are subject to increasing returns. Furthermore, this article has highlighted the more specific features of political environments that are likely to influence the initiation and reinforcement of increasing returns processes. In short, this is fertile territory for developing new propositions about the conditions that facilitate or impede various types of political change.

Consider one example. A prominent theme in recent research in comparative political economy is "varieties of capitalism." Despite increasing international economic interdependence, which seems to generate pressures toward convergence, the advanced industrial societies continue to exhibit fundamental differences in their core institutional structures (Berger and Dore 1996; Hall 1999; Hollingsworth and Boyer 1997; Soskice 1999). To date, this literature has done a better job of identifying and describing the diversity than it has of explaining what generates and sustains it. Hall and Soskice (2000) have made an important step forward by emphasizing the role of institutional complementarities. The benefits of particular economic institutions and organizations are increased if they operate in an environment populated by specific kinds of institutions and organizations.

The "varieties of capitalism" analysis persuasively illuminates distinct equilibria in different economies, but it does not address how these distinct equilibria emerge. From the current analysis, one can easily see

why the elaborate production systems of modern economies would be subject to increasing returns. Start-up costs, not just for new firms but more fundamentally for the key organizations and institutions that link private actors, are enormous. Organizations, and the formal and informal arrangements (both public and private) that help structure their interactions, create densely linked institutional matrices. Economic and social organizations and political institutions (both basic constitutional arrangements and public policy frameworks) have coevolved over extended periods. Coordination effects are widespread; particular courses of action make sense because of anticipated actions of others in the system. Firms have developed sophisticated strategies suitable to the particular institutional matrix they confront, that is, tremendous amounts of learning by doing have occurred over time in these complex systems. In short, national economic systems are highly path dependent. They are likely to exhibit substantial resilience, even in the context of major exogenous shocks, such as recent changes in the global economy.

In addition to highlighting particular causal processes that generate or sustain positive feedback, increasing returns arguments also direct attention to hypotheses explicitly based on timing and sequence. Under conditions conducive to path dependence, the same event (e.g., an exogenous shock such as depression or war) may have a different effect depending on when in a sequence of events it occurs (Collier and Collier 1991; Ertman 1996). Skowronek (1993) persuasively argues that we cannot understand the opportunities, constraints, and demands a president faces without placing him within a sequence of presidencies that support or oppose the dominant coalition of a particular period. Path dependence arguments provide a stronger foundation for Tilly's (1984, 14) claim that "when things happen in a sequence affects how they happen."

This highlights the broader theoretical significance of path dependence arguments: They can help political scientists think more clearly and explicitly about the role of time, and history, in social analysis. This is crucial because some claim to be witnessing a "historic turn" in the social sciences (McDonald 1996), but there is much confusion about what such a turn might mean. For some, particular historical outcomes are of intrinsic interest. For many, historical analysis is essentially a method, a way to expand the universe of cases that one can use to illustrate supposedly general theoretical models. The claim here is quite different. We should turn to history because important aspects of social reality can best be comprehended as temporal processes. It is not the past per se but the unfolding of processes over time that is theoretically central.

The main properties of increasing returns processes provide considerable support for many of the key claims of "historical institutionalist" analyses in political science. The phrase is a fortunate one, as it captures two critical themes explored here. This work is historical because it recognizes that political development must be understood as a process that unfolds over time.

It is institutionalist because it stresses that many of the contemporary political implications of these temporal processes are embedded in institutions—whether formal rules, policy structures, or norms.

Of these two elements, the institutional side generally has received greatest attention. Despite notable exceptions (Katznelson 1997; Orren and Skowronek 1994; Skocpol 1992; Skowronek 1993; Thelen 1999), the significance of temporal processes in historical institutionalist analysis is often left implicit or downplayed. Nevertheless, empirical work in this tradition highlights the need to examine temporal processes in order to explain important political outcomes. Historical institutionalist scholarship often emphasizes critical moments in politics, distinctive developmental sequences, and the rigidities that make it difficult for social actors to escape from established paths.

Of course, recent works of historical institutionalism build on a tradition of attention to history in the social sciences. Particularly for those who want answers to critical questions that grow out of the experiences of real polities, the turn to history has been common. Issues of timing, sequence, and critical junctures figure prominently in this body of work. Among many such studies, Gerschenkron's (1962) study of industrialization and state-building and Lipset and Rokkan's (1967) analysis of the formation of party systems are two classic examples. Indeed, it is fair to ask whether incorporating the concepts of increasing returns and path dependence into the study of politics is akin to the man who discovered that he had been speaking prose all his life. Is path dependence merely a trendy name for old ideas?

Discussions of path dependence would be worthwhile even if they did no more than focus the attention of a fad-prone discipline on the insights and continuing relevance of this earlier body of work. Yet, there is every reason to believe that the concept can do more. Knowledge of the dynamics of increasing returns processes can greatly sharpen our understanding of why particular junctures (and which aspects of them) are critical and why timing often counts for so much in politics. Most of the earlier work was vague on this point (Pierson n.d.b), although a detailed literature review would be needed to document that claim. The specific characteristics of positive feedback provide a key to making sense of the complex mix of stability and bursts of change that characterize so many political processes. As just discussed, an investigation of increasing returns processes can generate sharper hypotheses, based on more explicit social mechanisms, about the sources of divergent paths and social inertia.

There are, of course, important difficulties with increasing returns arguments. Two require at least brief attention. The first is methodological, and it concerns the difficulty of testing hypotheses based on complex, path dependent arguments (Geddes 1997).²²

The "many variables, few cases" problem is worsened in path dependent arguments, which require one to evaluate sequences of several variables over time.

This need not pose particularly acute problems for studying outcomes when it is possible to generate many cases (e.g., the formation of interest groups). Collective action and the development of actors' mental maps of politics seem to be promising areas of study. The "few cases, many variables" problem does pose difficulties, however, for increasing returns arguments that operate at a more aggregated level. The need to generate more cases helps explain why comparative politics has always been a field that emphasizes critical junctures (Collier and Collier 1991). Counterfactual analysis is also emerging as an important tool for such studies (Tetlock and Belkin 1996). Furthermore, analysts can use our growing theoretical understanding of path dependent processes to generate more observable implications, for instance, by focusing on intermediate stages in the processes. As Geddes (1997) argues, there are ways to deal with the "small n" problem, but they demand careful research designs. Even careful designs may well be inadequate for anything but fairly simple increasing returns arguments.

A second problem concerns the danger that the increasing returns concept suggests an overly static view of the social world. To take the starkest illustration, Arthur's Polya urn processes all settle on a particular equilibrium and then essentially stop. Increasing returns processes seem to generate only brief moments of "punctuation" in a largely frozen social landscape. To many, the significance of path dependence is belied by the evident dynamism of social life.

This is a sensible and useful challenge (Thelen 1999). But path dependent analyses need not imply that a particular alternative is permanently locked in following the move onto a self-reinforcing path. Identifying self-reinforcing processes helps us understand why organizational and institutional practices are often extremely persistent—and this is crucial, because these continuities are a striking feature of the social world. Asserting that the social landscape can be permanently frozen hardly is credible, and that is not the claim. Change continues, but it is bounded change—until something erodes or swamps the mechanisms of reproduction that generate continuity. North (1990a, 98–9) summarizes the key point well: "At every step along the way there [are choices]—political and economic—that provide . . . real alternatives. Path dependence is a way to narrow conceptually the choice set and link decision making through time. It is not a story of inevitability in which the past neatly predicts the future." The claims in path dependent arguments are that previously viable options may be foreclosed in the aftermath of a sustained period of positive feedback, and cumulative commitments on the existing path will often make change difficult and will condition the form in which new branchings will occur.

Indeed, as recently emphasized by Mahoney (n.d.) and Thelen (1999), identifying the particular feedback loops (or "mechanisms of reproduction") at work often provides key insights into the kinds of events or

²² It should be noted, however, that mainstream statistical research will also face difficult challenges if path dependent processes are common, since many quantitative techniques rest on the assumption that they are not (Jackson 1996).

processes that might generate major subsequent change points. Such junctures are usually attributed, often ex post, to "exogenous shocks." We should expect, however, that these change points often occur when new conditions disrupt or overwhelm the specific mechanisms that previously reproduced the existing

Increasing returns arguments open up an exciting research agenda for political science. In addition, an understanding of these processes can make another contribution to political scientists: a healthy dose of humility. Since the rise of behaviorism, many political scientists have had lofty aspirations about developing a science of politics, rooted in parsimony and generalization and capable of great predictive power. Despite modest achievements over four decades, these aspirations remain. Setbacks are shrugged off with calls for more time or more sustained application of the proper methods, but the inability to generate powerful generalizations that facilitate prediction remains a puzzle. If the prevalence of increasing returns processes is indeed a defining feature of politics, then we have been looking in the wrong place for an explanation. The main problem lies in the character of the political world itself.

Institutional Change in the House of Representatives, 1867–1998: A Test of Partisan and Ideological Power Balance Models

ERIC SCHICKLER University of California, Berkeley

examine competing explanations for House rules changes with significant partisan overtones. I sought to identify all rules changes adopted from 1867 to 1998 that were intended either to advantage or to undermine the majority party and its leaders in their efforts to shape the House agenda. I test a majority party cartel model of institutional change against a model that focuses on the ideological balance of power on the floor, that is, on the closeness of the median voter to the median member of the majority and minority parties. I also evaluate the conditional party government approach. The data analysis suggests the preeminent unportance of shifts in the ideological balance. Two variables identified by the conditional party government theory, party polarization and party capacity, obtain limited support, but their effect is neither as robust nor as large in magnitude as that of change in the median voter's position.

representatives. The rise of Newt Gingrich (R-GA) to the speakership, the machine-like control exercised by House Republicans for much of the 104th Congress, and the loud complaints of minority party Democrats (echoing the protests of House Republicans when they were a frustrated minority) all contribute to a growing sense that the House is aptly characterized in terms of majority party government.

The Republican experiment with strong party government buttresses Davidson's (1986) observation that Congress is a "moving target." Core features of legislative organization continually change, such that the House of the mid- to late 1990s, with its centralized party leadership, weak standing committees, and modest respect for seniority, is a very different institution from the House of the middle years of this century, which featured weaker party leaders, powerful standing committees, and considerable deference to seniority.¹

This variability raises the question of how to understand change in legislative institutions. In recent years, political scientists have developed important new the-

I am grateful to Eric McGhee, Pablo Sandoval, and John Sides for their invaluable research assistance. I also thank David Mayhew and Doug Arnold, Larry Bartels, Terri Bimes, Bruce Cain, Joseph Cooper, Gary Cox, David Epstein, Rui de Figueiredo, Jr., Steve Finkel, Donald Green, Bryan Jones, D. Roderick Kiewiet, Keith Krehbiel, Mathew McCubbins, David Rohde, Barbara Sinclair, Charles Stewart, Barry Weingast, and four anonymous reviewers for their helpful comments. Keith Poole generously provided much of the data used in this article. Additional data were provided by Tim Nokken, Rick Wilson, and Garry Young. The financial support from the Institute of Governmental Studies at Berkeley is gratefully acknowledged.

¹ For important characterizations of the mid-twentieth-century Congress, see Polsby 1968; Fenno 1965, 1973, and Shepale 1989. The difficulties experienced by House Republicans and their leaders in the 105th Congress (1997–98), when a coup attempt and other manifestations of internecine warfare embarrassed the party, suggest that the current revival of vibrant party leadership may turn out to be short lived (Cohen and Baumann 1998, Connelly and Pitney 1997; Mitchell 1998).

ories that highlight the role of the majority party as a procedural coalition governing House organization.² Two leading theories are the majority party cartel model elaborated by Cox and McCubbins (1993, 1994) and the conditional party government perspective developed by Rohde (1991), Aldrich and Rohde (1995, 1998), Binder (1996, 1997), and Dion (1997).

Cox and McCubbins argue that legislative institutions—at least in the case of the House—are designed and controlled by the majority party. They write (1993, 278) that the majority party manages to "usurp the rule-making power of the House" and uses that power to create institutions that best achieve party members' shared interests. Their thesis (1994, 218) is that majority party caucus rules "dictate that all members of the caucus are bound, if they wish to retain their membership, to support caucus decisions in the House on a variety of key structural matters—such as the election of the Speaker and the design and staffing of the committee system." As a result, "constitutional change of the House rules" cannot be obtained without the support of a majority of the caucus (1994, 223). The Cox and McCubbins theory leads to the substantively important prediction that the majority party will design rules and procedures that generally allow it to pull policy outcomes away from the floor median and toward the majority party's median position.3 Their work points to a dramatic reassessment of the so-called textbook Congress of the mid-twentieth century, suggesting that majority party Democrats exerted far more influence over legislative organization and policy outcomes throughout this period than most scholars have recognized.

Conditional party government theory also emphasizes the majority party's ability to shape legislative institutions, but advocates of this theory highlight variation in the degree of partisan control. Aldrich and

² See Jones 1968 on the concept of a procedural coalition. See also Froman and Ripley 1965 on the distinction between procedural and substantive votes.

³ As Groseclose and King (1997) point out, Cox and McCubbins never claim that the equilibrium policy in a one-dimensional framework will equal the median of the majority caucus, but they strongly suggest that policies often will be pulled toward the majority party median.

Rohde (1998) contend that the majority party's influence varies as a function of the party's internal homogeneity and the degree of polarization in the majority and minority parties' positions. An internally unified majority party that favors policies markedly different from those favored by the minority will be the most likely to enact rules changes that strengthen its agenda control (see also Cooper and Brady 1981). Binder (1996, 1997) agrees with Aldrich and Rohde that the majority party's capacity to change the rules varies across time. She argues that the relative unity and size of the two parties determine the ability of each to adopt rules changes that alter the legislative process in its favor. A large, unified majority party will be most likely to tighten its agenda control. Dion (1997), by contrast, contends that small majorities tend to be more cohesive and therefore are most likely to adopt rules changes that limit minority obstruction.

Although these models differ in significant respects, Cox and McCubbins (1997, 1376) rightly observe "something of a consensus" among scholars who have elaborated party-based theories: As the majority party becomes more homogeneous, rules changes that enhance its leaders' agenda control become more likely. When majority party members agree on basic policy stands—that is, when they have homogeneous preferences—they will have stronger incentives to give the party and its leaders increased control over the legislative agenda and decision making. By contrast, when there is disagreement on major policy issues, they will have incentives to give fewer tools to the party and its leaders.4

In this article, I develop and test an alternative explanation for House rules changes. I argue that shifts in the ideological balance of power on the floor, rather than change in the internal characteristics of the majority party, is the key determinant of changes in House rules. In this model, the median legislator on the floor is the pivotal decision maker. When she moves closer to the median member of the majority party, she will favor rules changes that enhance the majority party's agenda control. By contrast, when she moves closer to the median member of the minority party, she will favor rules changes that limit the majority party's agenda control and that instead create more opportunities for the minority party and cross-party coalitions.

The ideological balance of power approach draws upon Krehbiel's (1991, 1996, 1998) nonpartisan model of legislative institutions in emphasizing the critical influence of the median voter on legislative procedures and outcomes (see Black 1958). Yet, the ideological

power balance model is not entirely nonpartisan. Instead, it accepts the notion that some allocation of agenda power to political parties is necessary for a legislature to function effectively (see Cooper 1975, 1981). The key question is how much of that power will be allocated to the majority party and to the minority party and other competing power centers. I argue that changes in rules that determine the allocation depend on the ideological balance of power on the floor, that is, on the closeness of the median voter on the floor to the two parties. Dynamics on the floor, rather than the interests and deliberations of the majority party caucus, determine House rules changes.⁵

The median voter is pivotal for decisions about House rules because the Constitution gives the House as a whole the power to make its own rules. By longstanding precedent, a set of rules must be adopted at the start of each Congress.6 This gives a majority of members on the floor the opportunity to alter the rules to suit that majority's preferences. The ideological balance of power model is premised on the idea that the floor median will oppose rules changes that pull outcomes away from her favored policies and will instead seek changes that bring outcomes more closely in line with her preferences. Cross-party ideological coalitions therefore have the opportunity, and at times the incentive, to unite and pursue their policy goals through House rules changes that undermine the agenda control of the majority party and its leaders. Numerous significant rules changes, such as those in 1910, 1924, 1945, and 1967, were the work of crossparty coalitions operating against the wishes of most majority members.

Proponents of partisan models readily acknowledge that the floor median constrains what the majority party can accomplish (see, e.g., Aldrich and Rohde 1998; Cox and McCubbins 1994), but the distinctive contribution of party-based models to our understanding of House rules changes is their focus on majority party homogeneity. Given the widespread agreement on the homogeneity hypothesis, if it turns out that change in majority party homogeneity has little effect on adoption of House rules, then the explanatory power of these theories would be called into question. Furthermore, if change in the floor median has a substantial effect on adoption of House rules, then we would have new evidence of the applicability of the

⁴ An exception to this consensus is Flnk and Humes (1997), who argue that rules changes are least likely when there is a cohesive majority party, because it will not need rules changes to enact its policies. Their model makes predictions about the frequency of changes but not about their direction (in terms of strengthening or weakening majority leaders). Since the dependent variable in this article codes the direction of changes rather than their frequency, it does not provide a fair test for Fink and Humes. For similar reasons, I do not test the claim by Ainsworth and Sened (1998) that rules changes are most likely when turnover is high. They also make predictions about the frequency but not the direction of rules changes

⁵ The ideological power balance model thus departs from Krehblel by treating the allocation of agenda power to the majority party as a key variable that can affect policy outcomes. One might ask why the median voter does not create a new, centrist party and allocate agenda power to it. But creating a third party is likely to be costly for centrist members, particularly in the United States, where the first-past-the-post electoral system disadvantages smaller parties. Altering legislative rules is likely a less costly method for centrist legislators to shift the balance of agenda power in the desired direction.

From 1860 to 1890, House rules stated that the rules of the preceding Congress remain in force until amended by the new Congress. Even during this early period, it was generally understood that the Constitution gave the incoming Congress the right to adopt new rules without being bound by any preexisting rules (Alexander 1916; Damon 1971). Furthermore, House members still had the opportunity to consider new rules at the start of each Congress.

unidimensional spatial model (Black 1958; Downs 1957) to the choice of legislative institutions. Contrary to the fear that legislative institutions are likely to inherit the potential for "endless cycling" inherent in a multidimensional policy space (see Riker 1980), the ideological power balance model suggests that changes in House rules follow a predictable and orderly pattern: As the floor median (measured along a single, ideological dimension) moves toward the majority party, rules changes in favor of that party are more likely; when the median moves away from the majority party, rules changes that favor the minority party are more likely.⁷

Tests of competing models of legislative organization confront two major problems: It often proves difficult to operationalize the causal variables identified by each approach, and it is not always clear what each theory implies for many specific facets of legislative organization (Groseclose and King 1997). As a result, in the often fierce debate among advocates of the competing theories (Cox and McCubbins 1993, 1997; Krehbiel 1993; Rohde 1991, 1994; Schickler and Rich 1997a, 1997b; Sinclair 1994, 1998), few studies develop quantitative measures of change in the key variables of interest over a long period and relate those variables systematically to changes in legislative institutions. Binder (1996) is an important exception, but she does not test her conditional party government model against either the party cartel theory of Cox and McCubbins or against an approach based on the floor median (see also Fink and Humes 1997).

After clarifying the implications of the party cartel model, conditional party government theories, and the ideological balance of power model for understanding House rule changes, I devise measures that allow for a systematic test of how well each approach explains this feature of legislative organization. In constructing the dependent variable, I sought to identify all rules changes with significant partisan overtones adopted by the House from 1867 to 1998. I focus on this particular facet of institutional development not only because rules changes with partisan overtones have played an important role in congressional history but also because each theory makes relatively clear predictions about when such changes will occur. Furthermore, partisan rules changes provide a difficult test for the ideological balance of power approach, since one might well expect a party government model to fare best in explaining changes that are conspicuously partisan.

The data analysis shows that the ideological power balance model fares quite well in explaining partisan rules changes. By contrast, the key explanatory variable derived from partisan theories, change in the homogeneity of majority party members' policy views, does not have a statistically significant effect on rules changes. Similarly, the ideological balance of power approach

outperforms more elaborate conditional party government models, although changes in party polarization have had a significant effect as well, particularly in recent years.

On the whole, these findings are an important counterpoint to the increasing scholarly emphasis on majority party government that was sparked by the revival in party voting in the 1980s–90s (Cox and McCubbins 1993; Rohde 1991; Sinclair 1995). The results suggest that change in the ideological balance of power on the floor, as measured by the floor median, offers a better explanation of House rules changes than do the internal characteristics of the majority party. Notwithstanding this relatively straightforward finding, median voter models do not provide the complete story when it comes to institutional change. Therefore, I conclude by noting some limitations of the ideological balance of power model.

HYPOTHESES AND MEASURES

Between 1867 and 1998 there were several dramatic changes in House rules: the moves to eliminate minority obstruction in the 1890s; the destruction of the Speaker's so-called Czar Rule in 1909–10; the adoption of the 21-day rule in 1949 and again in 1965, which helped liberals overcome Rules Committee opposition; and the reforms adopted by the Democrats in the 1970s that bolstered majority leaders' agenda control.

The data set analyzed in this article includes any alterations in rules that were intended either to advantage or to undermine the majority party and its leaders in their efforts to shape the House agenda. Appendix A lists these changes. An example of a rules change intended to benefit the majority party is the Republican move in the 43d Congress (1873-75) to limit the use of dilatory motions. This paved the way for the Civil Rights Act of 1875, a top priority for the majority party (Damon 1971). The 1924 decision to liberalize the discharge rule is an example of a reform intended, at least in part, to undermine majority party leaders' agenda control. That decision made it easier for minority party Democrats and dissident Republicans to force the consideration of measures opposed by GOP leaders (Cooper [1960] 1988). By contrast, the Legislative Reorganization Act of 1946, which was championed by a broad, bipartisan coalition, exemplifies a change that, although important, does not qualify for consideration here because there is no evidence that members viewed the act in even remotely partisan terms (Cooper [1960] 1988; Davidson 1990). I excluded nonpartisan changes because neither party-based theories nor the ideological balance of power model make clear predictions about when these should occur.8

⁷ Earlier studies have demonstrated the importance of the median voter for congressional decisions concerning specific legislation (see, e.g., Krehbiel 1996; Krehbiel and Rivers 1988), but previous work has not assessed the explanatory power of the floor median with respect to changes in House rules

Nonpartisan rules changes do not shift the balance of agenda control in favor of one party or the other. As a result, the central premise of the ideological power balance model—that shifts in the floor median toward the majority or minority party lead to rules changes in that party's favor—does not translate into a prediction about nonpartisan rules changes. Extending the ideological power balance model (and party-based models) to address nonpartisan rules changes would be a worthwhile next step.

Each Congress between 1867 and 1998 is coded to reflect the pro- or antimajority party tenor of its rules changes. The resulting dependent variable is scored as follows:

- +1, if rules changes were adopted in a given Congress that, on balance, were intended to advantage the majority party and its leaders in their efforts to shape the House agenda;
- -1, if rules changes were adopted in a given Congress that, on balance, were intended to undermine the majority party and its leaders' efforts to shape the House agenda; and
- if no rules changes were adopted in a given Congress, or if the changes adopted were not, on balance, intended either to strengthen or to undermine the majority party and its leaders' agenda control.

I relied on leading sources on congressional rules and procedures to identify and classify rules changes (Alexander 1916; Cooper [1960] 1988; Damon 1971; Galloway and Wise 1976; Hasbrouck 1927).9 I also consulted the debate in the Congressional Record on specific rules changes when evidence from these secondary sources proved inconclusive. In classifying each change, I focused on the intent of its advocates, along with the composition of the coalition that adopted it.¹⁰ I classified rules changes in 21 of 66 Congresses as favoring the majority party and 8 of 66 as disadvantaging the majority party; in the remaining 37 cases there were no rules changes or changes that promised no net alteration in the majority party's degree of agenda control. Although Appendix A only lists Congresses in which partisan rules changes were made, the data set includes all Congresses in this period.

The rules changes analyzed in this article had a substantial influence on the degree of agenda control exercised by the majority party and its leaders. Advocates of partisan theories rightly claim that House rules since the mid-nineteenth century have always included some advantages for the majority party (Cox and McCubbins 1997),¹¹ but this by no means minimizes the significance of the variations in majority party agenda control during this period. For example, the prerogatives available to majority party leaders were greatly enhanced by the adoption of Reed's rules in 1890, just as they were significantly diminished in the aftermath of the 1910 revolt against Speaker Joseph Cannon (Cooper [1960] 1988; Peters 1997). These were

⁹ The Congressional Quarterly Almanac also proved helpful for the 1945–98 period. not simply minor changes that only marginally affected agenda control. Instead, they are just two of many cases that significantly altered the balance in control between the majority party and competing coalitions. Indeed, the changes listed in Appendix A were typically the subject of fierce floor fights that highlighted the considerable stakes involved. ¹² It is therefore appropriate to expect a partisan theory of legislative organization to account for these changes. ¹³

To check the robustness of the results, I replicated all the analyses using Binder's (1996) list of rules changes in her article on minority obstruction. Binder focuses on the creation and suppression of minority rights, so her case selection criteria are somewhat narrower than mine. She omits changes intended to advantage one party that are unrelated to questions of minority rights. An example is the 1945 rule granting standing committee status to the House Un-American Activities Committee. Rather than add to the official list of minority prerogatives, this rule created a new committee power base. Nonetheless, it undermined the ability of majority party leaders to submerge the issue of communist subversion, which provided clear benefits for the minority Republicans.

My case selection criteria, therefore, have the advantage of encompassing a broader range of rules changes than do Binder's criteria. At the same time, by combining a relatively diverse set of changes, I risk undermining the extent to which each of the coding categories constitutes a single class. It turns out that the results obtained from analyzing Binder's list of changes are extremely similar to the estimates obtained from analyzing the list in Appendix A. This makes it unlikely that the findings reported here are compromised by the coding scheme. (See Appendix A for a description of the coding differences between Binder's variable and the dependent variable employed here and for a discussion of a handful of difficult coding decisions.)¹⁴

¹⁰ The antimajority party changes did not always grant new minority rights. For example, repeal of the 21-day rule in 1951 strengthened the Rules Committee, rather than vesting new powers in the minority, but the committee was a power base for the cross-party conservative coalition in this period (Lapham 1954). Members believed that strengthening Rules would weaken majority leaders and help minority party Republicans. More generally, changes that weaken majority leaders' agenda control tend to open up more opportunities for cross-party coalitions. I code such a change as antimajority party when floor debate and specialized sources suggest that members believed it would advantage minority party members at the expense of majority party leaders.

¹¹ For example, with few exceptions, majority party members have monopolized committee chairmanships during this period.

¹² See, for example, the floor debate on the Reed rules (Congressional Record, January 29, 1890, pp. 948–60), the overthrow of Speaker Cannon (March 17, 1910, pp. 3292–334), the creation of the House Un-American Activities Committee (January 3, 1945, pp. 11–4), the repeal of the 21-day rule in 1951 (January 3, 1951, pp. 9–18), and the "packing" of the Rules Committee in 1961 (January 31, 1961, pp. 1573–90).

¹³ According to Cox and McCubbins (1994, 221), their theory suggests that "caucus members are obliged to vote with the majority of the caucus on specified House votes, including . . . the adoption of key House rules . . . Key house rules are (i) those designating the powers of the [speaker and committee charmen], such as the speaker's agenda-setting powers, the agenda-setting powers of committee and subcommittee charpersons, and the jurisdictions of the committees, and (ii) those specifying how House rules can be changed." The rules changes listed in Appendix A typically had important effects on the agenda powers of the Speaker and of committees or on committee jurisdictions. Therefore, these changes clearly fit within the domain of the Cox and McCubbins theory.

¹⁴ One limitation of the dependent variable is that changes that differ in importance—such as adoption of Reed rules in 1890 and a less monumental 1925 change curbing the discharge process—are each coded as +1 (or −1, in the case of prominority changes). Thus limitation makes it impossible to know whether the higher number of promajority than prominority changes observed in the data set means that the net advantage of the majority party has increased over time. Previous work on House rules has shared this problem (see, e.g.,

Both versions of the dependent variable exclude changes in party rules as opposed to House rules. For example, neither dependent variable includes the changes in party rules adopted by the Democratic Caucus in the 1970s. I exclude party rules because there is little reason to expect the same dynamics to characterize changes in these and in House rules. The latter must be approved by a majority on the House floor; the former require only a majority of the caucus. The finding that the floor median is the key determinant of House rules changes leaves open the question of whether the majority party is able to use caucus rules changes as an alternative mechanism to achieve its goals (see Rohde 1991, and discussion below). Again, this study is intended to test the usefulness of partisan and ideological power balance explanations for one important domain of legislative institutions, the adoption of House rules. It is not intended to demonstrate that a single model can explain all elements of legislative organization.15

To construct the independent variables, I rely heavily on Poole and Rosenthal's DW-NOMINATE scores (see McCarty, Poole, and Rosenthal 1997). NOMINATE scores are the most commonly used measure for members' ideological positions. They are based on all nonunanimous roll call votes taken in each Congress. DW-NOMINATE scores have the virtue of comparability across time. Although critics have pointed out several shortcomings (Heckman and Snyder 1996), NOMINATE scores offer a reasonably good measurement of members' ideological positions. Therefore, I use first-dimension DW-NOMINATE scores to calculate the location of the floor and party medians as well as party homogeneity.

The first hypothesis that I test from partisan theories reflects the near-consensus position articulated by Cox and McCubbins (1997, 1385–6): "If one wants to examine rules changes from the perspective of a partisan theory, one has to look systematically at changes in the homogeneity of the majority caucus. One expects decreasing homogeneity to lead to fewer institutional powers for majority party leaders, increasing homogeneity to lead to greater powers." I infer from Cox and McCubbins:

HYPOTHESIS 1: CHANGE IN HOMOGENEITY. Rules changes that enhance the agenda control of the majority party and its leaders are more likely as the majority party becomes increasingly homogeneous. Rules changes that reduce such majority party advantages are more likely as the party becomes more heterogeneous.

Binder 1996). A promising direction for future research would be to ask a group of experts to rank the importance of each rules change, which could yield more refined measures.

Following Aldrich and Rohde (1998, 13), I operationalize majority party homogeneity as the standard deviation of majority party members' first-dimension NOMINATE scores divided by the standard deviation of all House members' first-dimension NOMINATE scores (see Appendix B for a full definition of this and the other independent variables). I then compute change in that variable. Consistent with Cox and McCubbins (1997, 1381), when party control of the House changes hands, the homogeneity of the new majority party is compared to that of the outgoing majority party. Thus, the change in homogeneity variable for the 104th Congress, in which the GOP took control of the House, would be calculated as follows:

Δ HOMOGENEITY = GOP HOMOGENEITY_(104th)

- DEMOCRATIC HOMOGENEITY (103d)

where each party's homogeneity is the standard deviation of its members' first-dimension DW-NOMINATE scores divided by the standard deviation of all House members' first-dimension scores. Since a high standard deviation is associated with a low level of party homogeneity, this variable is expected to have a negative sign when predicting partisan rules changes.¹⁷

Figure 1 shows the majority party homogeneity scores for 1867–1998. This graph looks quite similar to what a close observer of congressional history might expect. For example, the majority party standard deviation is fairly high in the 1920s, an era of Republican majorities beset by significant internal divisions. After a brief fall during the early New Deal years, when Democrats voted with unusual unity, the standard deviation begins a substantial rise in 1939 and peaks in 1967, when majority party heterogeneity appears to have reached an historical high. This corresponds to the era of deepest divisions among southern and nonsouthern Democrats. The steadily declining standard deviation after 1970 reflects the well-documented easing of Democratic divisions in the 1970s and 1980s (Rohde 1991). This variable seems, therefore, to be a reasonably good measure for majority party homogeneity.¹⁸ It is plausible, however, that homogeneity ought to be considered in terms of multiple dimensions (Cooper and Young 1997; Fink and Humes 1997). In response to this potential concern, I replicated each analysis substituting a measure of homogeneity based on both NOMINATE dimensions (see Appendix B). This substitution had little effect on the results.

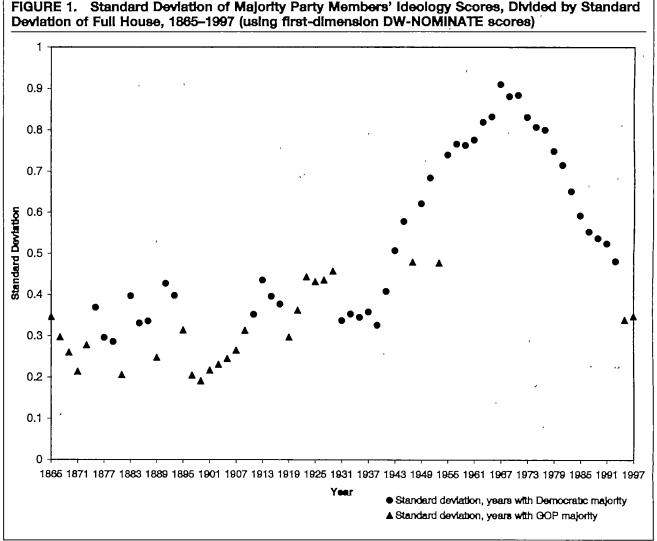

A second prediction that emerges from the Cox and McCubbins model is that when party control of the House changes hands, partisan rules changes are likely.

¹⁵ The most noteworthy changes in caucus rules in recent decades were adopted by the majority Democrats in 1971–75 (Rohde 1991) Interestingly, all those Congresses are coded as having promajority changes (see Appendix A). This suggests, albeit tentatively, that extensive use of the majority party caucus and promajority rules changes tend to go together, rather than primarily substituting for one another.

¹⁶ More precisely, votes are excluded in which fewer than 2.5% of the members voting are on the loging side.

¹⁷ A simpler definition of homogeneity uses the majority party's standard deviation without dividing by the standard deviation for the full House. When this alternative measure is used, the results are substantively identical to those reported below. I choose the more complicated operationalization because it corrects for changes in the scale as the entire rank-and-file become more or less spread out (see Aldrich and Rohde 1998).

¹⁸ This is not to say that DW-NOMINATEs are a perfect measure for homogeneity (see Appendix B for a discussion of some limitations of this measure).

If the Democrats, while in the majority, stack the rules to favor their policies, then a new Republican majority should reverse these provisions and adopt rules that help promote GOP priorities. One might well interpret several of the changes adopted in 1995 by the new Republican Congress in these terms.

Cox and McCubbins (1993, 1997) are careful to point out that institutional arrangements geared toward promoting specific policies are by no means the only type of deck-stacking that the majority party is likely to employ. As a result, partisan rules changes are not inevitable whenever party control of the House changes hands. Nonetheless, Cox and McCubbins's discussion (1994, 220) of the role of the "judicious allocation of committee power" in upholding majority party logrolls suggests that partisan deck-stacking often does have a policy-specific element (see also 1993, 248-57). A classic nineteenth-century example is the Holman rule, which was repeatedly adopted by Democratic Congresses in the post-Reconstruction era. It allowed expenditure-reducing riders to appropriations bills and was an important Democratic weapon in the party's battles with Republican presidents (Kiewiet and

McCubbins 1991; Stewart 1989).19 Therefore, the second hypothesis tested is:

Hypothesis 2: Change in Party Control. A switch in majority party control of the House is likely to lead to rules changes in the new majority party's favor.

The conditional party government approach of Binder (1996), Dion (1997), and Rohde (1991) generates three additional hypotheses. The first of these is derived from Binder:

Hypothesis 3: Party Capacity. The stronger the majority party relative to the minority party, the more likely are rules changes that advantage the majority party. The weaker the majority party relative to the minority, the more likely are changes that disadvantage the majority party.

¹⁹ Notice that changes in party control should have less effect when Binder's list of rules changes is the dependent variable. The reason is that Binder's focus on rules affecting minority rights excludes most cases of policy-specific deck-stacking. My criteria, however, include several cases that arguably fit that description.

Following Binder, party capacity is operationalized as a function of the relative homogeneity of the two parties and the share of seats held by each. The basic idea is that if the majority party is highly unified and has a large share of House seats, then its capacity to impose rules changes is higher than if it is internally divided and has only a slim majority. Binder (1996, 13) uses each party's Rice cohesion score as a measure of its homogeneity, and for each Congress she multiplies this score by the percentage of seats that the party holds to gauge its strength. Party capacity is the difference obtained when minority party strength is subtracted from the majority party's strength. For purposes of comparability, I constructed a measure of partisan capacity using the standard deviation of each party's members' first-dimension DW-NOMINATE scores in place of the Rice cohesion scores (see Appendix B for a precise definition of both measures).

The party capacity hypothesis focuses on the observed level of party capacity in Congress t, not on the change between Congresses t and t-1. One might argue that change scores are the more appropriate variable to use when predicting rules changes (see Cox and McCubbins 1997, 1385); furthermore, the hypotheses about homogeneity and the ideological balance of power are stated and tested in terms of change scores. I estimate separate models using either change scores or observed levels of party capacity as an independent variable.²⁰

Binder's concept of party capacity has much in common with the notion of the ideological balance of power on the floor. When the majority party has a large edge and is highly unified, it seems likely that the median voter on the floor will be quite close to the majority party median; when the majority party is divided relative to the minority and has only a slim margin, it is more likely that the floor median will be distant from the majority party median.²¹ But Binder's theory and the median voter approach nonetheless identify different causal mechanisms for rules changes. In Binder's view, the characteristics of the parties themselves—their unity and size—determine House rules changes pertaining to minority rights. By contrast, the ideological power balance model holds that the position of the median voter on the floor is critical. Put simply, the median voter is identified as the key decision maker by the ideological power balance approach, whereas the parties have a more prominent role in determining institutional rules in Binder's model.

In contrast to Binder, who argues that the majority party is more likely to pass rules changes that increase its agenda control when it has a substantial majority, Dion (1997) asserts that small majorities are most likely to be cohesive and to limit minority rights. Because Dion focuses on the nineteenth century, which was the era of greatest minority obstruction, it may not be fair to test his model with data that extend into the late twentieth century. Nonetheless, the fourth hypothesis is:

HYPOTHESIS 4: MAJORITY SIZE. As the majority party's share of seats becomes smaller, rules changes that advantage the majority party are likely.²²

The fifth hypothesis is derived from Rohde's (1991) work on conditional party government:

Hypothesis 5: Change in Party Polarization. As the majority party median moves farther from the minority party median, rules changes that advantage the majority party are likely.

The Rohde hypothesis is premised on the idea that when the majority and minority party are far apart in their policy preferences—that is, when there is a high level of party polarization—the majority party has more incentive to enact rules that enhance its agenda control (see also Aldrich and Rohde 1998). When party conflict over major issues is low, the majority party has less reason to shut out the minority, and it can allow more cooperative, bipartisan arrangements. In support of this argument, Rohde (1991) traces how the House Democratic majority tightened its grip on the legislative process in the 1970s and 1980s as Democrats and Republicans moved farther apart in their ideological positions. I measure change in polarization by computing the difference between the two party medians and then assessing change in that variable from Congress t-1 to Congress t.

In the ideological balance of power model, the key to partisan rules changes is the location of the floor median relative to the two parties. The model suggests that the median voter will confer a greater share of agenda control on the majority party when she moves closer to the median ideological position of majority party members. The floor median will be more willing to work with the minority to undercut the majority party's agenda control when she moves farther from the majority party median and closer to the minority party median. Thus, the sixth hypothesis is:

Hypothesis 6: Change in Ideological Power Balance. Rules changes that advantage the majority party and its leaders are more likely when the floor median moves in the direction favoring the majority party. Rules changes that reduce majority party advantages are more likely when the floor median moves in the direction favoring the minority party.

²⁰ Using observed levels of party capacity would be problematic if that variable were nonstationary (Kennedy 1994). But Dickey-Fuller and Phillips-Perron tests both reject the null hypothesis of a unit root at p < .05, and visual examination of the party capacity time series and autocorrelation function suggest the series is stationary.

²¹ That said, the correlation between Binder's measure of party capacity and the location of the median voter (relative to the majority and minority party-medians) is just 36. Her measure correlates more strongly with change in the location of the median voter, however, which suggests that multicolmearity may hinder hypothesis testing when change scores are used. The low standard errors in the models that include both the floor median and party capacity variables indicate that this is not a major problem (see Table 3).

²² A strong case can be made that the Dion hypothesis is more appropriately tested with respect to Binder's list of rules changes, since that list is confined to rules affecting minority rights. The hypothesis receives little support, however, regardless of which dependent variable is used.

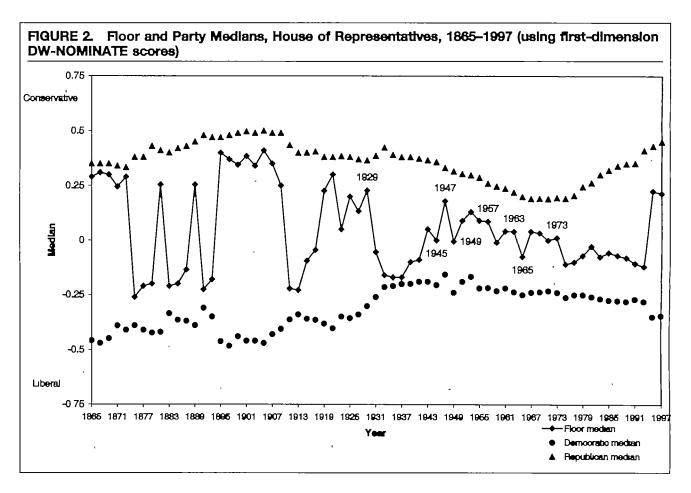

Figure 2 graphs movement in the floor and party medians over time. For each Congress, progressive or liberal positions are associated with negative values for NOMINATE scores, and conservative positions are associated with positive values.²³ Note also that the Democratic median is always negative, and the GOP median is always positive. Once again, shifts in the floor median for the most part make substantive sense. For example, the big Democratic seat gains following the 1930, 1948, 1958, 1964, and 1974 elections each led to substantial shifts in the floor median to the left, as Republican gains in 1946, 1950, and 1966 led to marked shifts to the right. (The positions just before each of these election years are highlighted in the body of Figure 2.)

Assessing the ideological balance of power on the floor requires measuring movement in the floor median toward the majority or minority party. This task is complicated by switches in party control. A movement of the floor median in the positive direction (e.g., from

-.10 to +.10) has opposite implications for the majority party depending on whether it is the Republicans or Democrats. The measure that best deals with these complications is called " $\Delta MEDIAN_{ADV}$." It is defined as follows: Take the distance between the minority party median and the floor median, compare it to the distance between the majority party median and the floor median, and assess change in that variable between Congress t and Congress t-1.

$$\begin{split} \text{MEDIAN}_{\text{ADV}} &= \text{abs}(\text{MEDIAN}_{\text{floor}} - \text{MEDIAN}_{\text{min}}) \\ &- \text{abs}(\text{MEDIAN}_{\text{floor}} - \text{MEDIAN}_{\text{maj}}) \end{split}$$

$$\Delta MEDIAN_{ADV} = MEDIAN_{ADV(t)} - MEDIAN_{ADV(t-1)}$$

This variable denotes change in the relative proximity of the majority party median and the minority party median to the median legislator on the floor.²⁴ I experimented with alternative measures for change in the median and obtained results that are extremely

²³ The term "liberal" before the 1930s is somewhat anachronistic. The meaning of the NOMINATE scale has likely shifted over time. The data analysis uses change scores from one Congress to the next, and thus presupposes that changes in the scale do not occur within a two- to four-year period (e.g., from the beginning of the 98th Congress in January 1983 to the end of the 99th Congress four years later). Such an assumption is more plausible than the claim that the scale does not shift over more extensive time spans Poole and Rosenthal (1997) present evidence that the first NOMINATE dimension has, with rare exceptions, captured conflict concerning government intervention in the economy.

²⁴ The ideological power balance model assumes that a single ideological dimension is primary when it comes to partisan rules changes. Analysis of the roll call votes on the individual rules changes suggests that this is a reasonable assumption: First-dimension NOM-INATE scores are generally the strongest predictor of members' votes. On a few occasions the second dimension also is significant, as in the overthrow of Speaker Cannon in 1910. Even in that case, however, first-dimension NOMINATEs are a much stronger predictor of members' votes than are second-dimension scores (see Schickler and Sides n.d. for an analysis of a nonpartisan 1899 Senate rules change in which the second dimension was primary).

similar to the results reported below. (See Appendix B for a description of one such alternative measure and an example that illustrates how scores on the $\Delta \text{MEDIAN}_{\text{ADV}}$ variable are calculated.)

As noted above, partisan models do not necessarily predict that change in the median will have no effect (see, e.g., Aldrich and Rohde 1998, who readily acknowledge the importance of the floor median). Yet, for partisan theories to add to our understanding of House rules changes, the variables identified by those theories should have an influence net of change in the floor median.²⁵

RESULTS

Table 1 presents descriptive statistics for the variables used in the analysis and also shows the mean for each variable in Congresses with no rules changes, promajority changes, and antimajority changes. At the bivariate level, there does seem to be a relationship between change in the floor median and partisan rules changes. For example, in the eight Congresses in which antimajority changes occurred, the median shifted by an average of .210 (SE = .063) in favor of the minority party; in the twenty-one Congresses with promajority changes, the median shifted by an average of .081 (SE = .028) in favor of the majority party. A similar, although statistically weaker, relationship exists as well between changing majority party homogeneity and

²⁵ It is also worth noting that even in the present era of highly polarized parties, the ideological power balance and homogeneity hypotheses will often yield different predictions. For example, if the majority party loses 20 seats in the House, the floor median will almost certainly move in the minority's direction even if each party's homogeneity remains unchanged and the two parties' distributions of ideal points do not overlap. In that circumstance, the ideological power balance hypothesis leads one to expect a prominority party

rules change, while the homogeneity hypothesis leads one to expect no change.

rules changes. The question is how well these relationships hold up in a multivariate analysis.

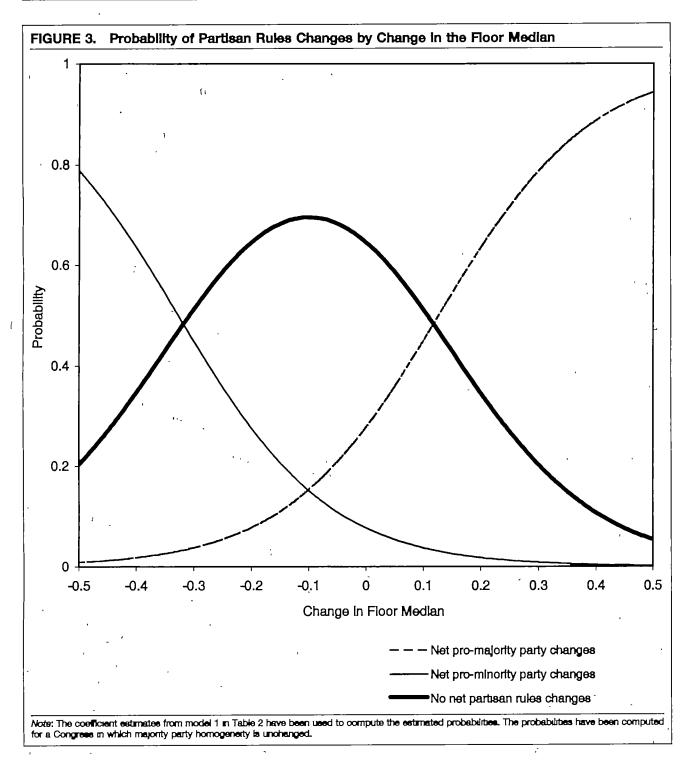

Since the dependent variable is a set of ordered categories, I use ordered logit to test the competing explanations of rules changes. Table 2 reports a series of models that assess the ideological power balance and party cartel models. Starting with a baseline model (labeled model 1), which includes change in party homogeneity and change in the floor median, the results are striking: The coefficient for change in homogeneity is small and insignificant (b = -1.518; SE = 3.422), while the effect of change in the floor median is of the correct sign and is both substantively and statistically significant (b = 7.968; SE = 2.075).

This first model, therefore, supports the ideological balance of power hypothesis and provides no evidence for the homogeneity hypothesis.

To understand these results better, it is helpful to use substantively interesting sample values for the variables in the model. Figure 3 takes a simple case in which the majority party's homogeneity is constant and shows the estimated effect of movement in the floor median on the probability of partisan rules changes. In such a situation, if there is no change in the floor median, the expected probability of a promajority rule change is .27, and the expected probability of an antimajority change is .07. If the floor median shifts by .25 in the majority party's direction—about the size of the shift toward the Democrats following the 1964 and 1974 elections—then the probability of a promajority rules change rises from .27 to .73. The probability of an antimajority change falls from .07 to just over .01. In fact, the 1964 and 1974 Democratic gains were both followed by promajority rules changes: the adoption of the 21-day rule to aid the passage of liberal legislation in 1965, and, among other changes, the elimination of

expected probability of a promajority rules change only slightly, from 27 to .32. By contrast, a similar increase in the median in favor of the majority party increases the probability of a promajority change from 27 to .82.

²⁶ The ordered logit models were estimated using SAS, version 6.12. The use of over-time data may produce problems of nonstationarity, autocorrelation, or heteroscedasticity. But the dependent variable and main independent variables are change scores, likely mitigating problems of nonstationarity and of autocorrelated residuals. Phillips-Perron and Dickey-Fuller tests on each variable reject the null hypothesis of a unit root at p < .05. Furthermore, when the analysis is replicated using OLS, the results are unchanged, and Durbin-Watson tests give no evidence for autocorrelated residuals. Finally, as Binder (1996, 16) argues with reference to her similar data set, "there are no theoretical reasons to expect ... autocorrelation or heteroscedasticity.... The historical record lends no evidence that past reforms have been mimicked by subsequent majorities or that there have been any learning effects from one Congress to another." ²⁷ If there is no change in the floor median, then an increase of two standard deviations in majority party homogeneity increases the

a committee staffing guarantee for the minority in 1975.

If the median shifts by .30 toward the minority party—about the size of the shift toward the Republicans following their strong, although not House-capturing, showing in the 1966 elections—then the likelihood of an antimajority rules change rises from .07 to .47, and the probability of a promajority change falls from .27 to .03. The 1966 GOP gains did lead to an antimajority rules change in 1967: A cross-party coalition uniting Republicans with conservative Democrats repealed the 21-day rule that had been passed in the

previous Congress. These examples illustrate the substantial effect of shifts in the floor median on partisan rules changes.

An important issue is the robustness of these results in response to plausible changes in model specification. First, when dummy variables for switches in party control are added to the model, there is no support for either the homogeneity or party control hypotheses, but change in the median remains significant. This is shown in model 2 of Table 2. Second, if the observed level of majority party homogeneity is used in place of change in homogeneity, the floor median continues to

be a strong, significant predictor, but the effect of party homogeneity is insignificant.28 Third, the results are again unaffected when I use a measure for change in homogeneity that is based on both NOMINATE dimensions, as opposed to just the first dimension (see models 3 and 4 of Table 2).29 Fourth, I altered the baseline model by adding a lagged value for the change in homogeneity variable. This move was based on the hypothesis that a change in homogeneity may not have an instantaneous effect because it may take time for majority party members to rally support for proposed reforms (see Rohde 1991). Even in this revised model, neither homogeneity variable had a significant influence, but change in the median continued to be significant.30 Finally, using Binder's list of rules changes as the dependent variable has little effect on the results. Those estimates are presented in Appendix C.31

Contrary to the predictions of the Cox and McCubbins majority party cartel model, neither changing party homogeneity nor changes in partisan control of the House appear to have a significant effect on partisan rules changes, but a shift in the floor median has a strong influence.³²

Some might question the validity of the measure for change in the floor median, as it is based on the admittedly imperfect DW-NOMINATE scores. A further robustness test of the model is to substitute change in the percentage of seats held by the majority party for change in the floor median. All else equal, as the majority party increases its share of seats, the ideological balance of power on the floor should shift in the party's favor. This specification also offers the opportunity to assess Dion's model. His theory suggests the majority party's seat share should have a negative effect on the adoption of partisan rules changes: The majority party is more likely to tighten its control when it has a slim majority.

When change in the share of seats held by the majority party is substituted for change in the floor median, both the homogeneity and seat share variables are significant (see model 5 of Table 2). The effect of the seat share variable is *positive*, as expected by the ideological balance of power model, but contrary to the expectations derived from Dion's theory.³³ Still, this

finding is consistent with some variants of conditional party government theory (Aldrich and Rohde 1998; Binder 1996). The key question is what happens in a model that contains the floor median as well as the majority party's seat share. Model 6 of Table 2 shows that, controlling for change in the floor median, neither the majority party's seat share nor majority party homogeneity has a significant effect on the likelihood of partisan rules changes. But the effect of change in the median remains strong and significant. Including the variable for change in the median also improves the fit of the model considerably, increasing the χ^2 statistic by 4.986 while sacrificing one degree of freedom (p < .05). The results reported in model 6 are unaffected by adding dummy variables for switches in party control.

It might be the case, however, that a more complicated conditional party government model would outperform the floor median as a predictor of rules changes. Table 3 presents a series of models that assess this possibility. Since Binder's (1996) test of her partisan model has justly been praised as convincing evidence for the conditional party government theory (see, e.g., Cox and McCubbins 1997), I estimated several models with the party capacity variable that Binder finds to be an important predictor of the adoption of rules concerning minority rights.

Model 1 of Table 3, which excludes the floor median variable, suggests that party capacity has a strong, significant influence on the adoption of partisan rules changes (b = .099; SE = .031). But as model 2 shows, when change in the floor median is added, the estimated effect of party capacity is cut substantially, although it remains just statistically significant at the .05 level (b = .058, SE = .035; p = .05). Change in the median is once again a strong and statistically significant predictor of rules changes, and its inclusion improves the predictive accuracy of the model considerably ($\chi^2 = 11.764$, 1 d.f., p < .01).

Although model 2 suggests that party capacity has a significant influence on the adoption of partisan rules changes when controlling for change in the median, the coefficient for party capacity is both lower in magnitude and much less robust than the coefficient for change in the median. In terms of magnitude, the standardized coefficient for change in the median is twice as large as that for party capacity (.58, as compared to .28). Furthermore, if Binder's list of rules changes is used as the dependent variable, as in model 3 of Table 3, party capacity is no longer statistically significant when change in the floor median is included (b = .043); SE = .039). Similarly, if change in party capacity is used as the independent variable in place of the observed level of party capacity (data not shown), the coefficient for party capacity is again insignificant. This holds

scores and only cover the 1879-1988 period.

The estimate for change in the median is 8.268 (SE = 2.064), and the estimate for homogeneity is 1.508 (SE = 1.272). The results are similar when the two-dimensional homogeneity measure is used. ²⁹ As noted in Appendix B, these two models use D-NOMINATE

⁵⁰ The estimate for change in homogeneity from Congress t-2 to Congress t-1 was -4.502 (SE = 3.576); the estimate for change in homogeneity from Congress t-1 to Congress t was -2.435 (SE = 3.586). The estimate for change in the median was 7.756 (SE = 2.107). The results were similar when I used the *level* of homogeneity in the current and preceding Congresses instead of change scores. ⁵¹ Binder's list of rules changes ends in 1990. The analysis using her list covers 1867-1990.

 $^{^{32}}$ These results are not attributable to collinearity. The correlation between change in the median and the one-dimensional measure for change in homogeneity is just -27. The correlation between change in the median and the two-dimensional measure for change in homogeneity is -31.

³³ Again, Dion restricts his discussion to rules affecting mimority rights, and he focuses on the nineteenth century, an era when

minority obstruction was particularly troublesome. This analysis is not a refutation of Dion's treatment of four cases of rules changes to limit minority obstruction. Instead, it suggests that Dion's theory cannot be extended to explain the broader set of changes analyzed here.

²⁴ The majority party seat share variable now is negatively signed, as one would expect from Dion, but it falls far short of statistical significance.

Changes, 1867-1998				Mandal O		Model 5

Note Standard errors are in parentheese, *p < 05, **p < .01; one-tailed tests. Models 3 and 5 use Binder's list of rules changes as the dependent

regardless of which list of rules changes is used as the dependent variable. Finally, if NOMINATE scores are used in place of Rice cohesion levels when calculating party capacity, the capacity variable is insignificant, controlling for change in the median. This again is the case regardless of which list of rules changes is used as the dependent variable (see models 4 and 5 of Table 3). Indeed, the only specification in which party capacity achieves statistical significance (when change in the floor median is included in the model) is model 2 of Table 3. Change in the median is statistically significant in each of these models.³⁵

vanable.

Finally, when Rohde's variant of conditional party government theory is assessed, the results support both the median voter model and the party polarization hypothesis. Model 6 of Table 3 includes change in homogeneity, change in party polarization, and change in the median. The homogeneity variable is small and insignificant, but both changes in party polarization

and changes in the median have a significant effect. In terms of magnitude, the standardized coefficient for change in the median is more than twice as large as that for change in polarization (.72, as compared to .31). When this analysis is replicated using Binder's list of rules changes, the effect of change in the median remains robust, but the polarization variable now is smaller and falls well short of statistical significance (b = 4.919; SE = 7.815). Nonetheless, the results in Table 3 suggest that party polarization may well have an important influence on the adoption of partisan rules changes. At the same time, it is worth emphasizing that the effect of change in the median is strong no matter which other variables are included in the model and no matter which dependent variable is used.³⁶

As a final robustness check, I split the time period in

³⁵ I also examined whether the Speaker's ideological distance from his party's median affects the adoption of partisan rules changes. Jones (1968) argues that if a party leader adopts positions that depart from the policy views of the coalition that elected him, then he will often face revolts that challenge his institutional power. Nonetheless, when this variable is included alongside change in homogeneity and change in the median, it has a small and insignificant effect, while the effect of change in the median remains robust. The Speaker distance variable is computed by comparing the Speaker's first-dimension NOMINATE score in the last Congress before he became Speaker with his party's median in the current Congress.

 $[\]infty$ One variable missing from the analysis is partisan need. Rules changes may be likely when majority party members' policy goals are stymied by rampant minority obstruction. One plausible measure for partisan need is the number of roll call votes in the preceding Congress (Binder 1996). When that variable is added to the baseline model (see Table 2, model 1), the estimates for the median and party homogeneity are unaffected, but the number of roll calls is significant. Use of the roll call variable is problematic, however, because it is nonstationary (using Dickey-Fuller and Phillips-Perron tests, one cannot reject the null hypothesis of a unit root, p=.58 and p=.61, respectively). Indeed, the mean number of roll calls increases dramatically after a 1970 rule change that made it easier to obtain recorded votes on amendments. When the roll call series is differenced (making it stationary), it is reduced in size and is maignificant.

half, analyzing separately those Congresses before Franklin Roosevelt's election as president and those Congresses from 1933 through 1998.³⁷ This allows for the possibility that the parameters of interest have changed substantially in recent years. As models 1 and 3 of Table 4 show, when only change in homogeneity and change in the median are included, there is no support for the party government interpretation in either period, whereas the ideological power balance model gains support both before and after 1933. Models 2 and 4 add change in polarization to this baseline model, and the results are instructive. In the 1867–1933 period, changes in neither polarization nor homogeneity have a significant effect, but the median has a strong, significant influence. In 1933-98, however, change in both the median and polarization have a statistically significant effect on the adoption of partisan rules changes. The standardized estimate for the polarization variable is still smaller than that for the median (.396, compared to .483), but the difference is much narrower than for the full 132-year period.38

In summary, at least one element of conditional party government theory—the emphasis on changes in party polarization—has become more important in recent years. Consistent with Rohde's (1991) analysis, as the parties have increasingly diverged in their policy

³⁷ An anonymous reviewer suggested using 1933 as the dividing point.

preferences, there apparently has been greater determination by majority party members to tighten agenda control. The homogeneity hypothesis receives little support, regardless of the period examined. The ideological power balance model has substantial explanatory force, no matter which period or dependent variable is examined.

DISCUSSION

In the ongoing debate concerning the role of political parties and floor majorities in shaping legislative rules (Cox and McCubbins 1993, 1997; Krehbiel 1991, 1993; Rohde 1991, 1994; Schickler and Rich 1997a, 1997b; Sinclair 1994), few studies have attempted to measure the key variables of interest over a long period. Binder's (1996) work is an important exception (see also Fink and Humes 1997), and it is perhaps the most convincing demonstration of the usefulness of a conditional party government approach for understanding institutional change in the House over a long time span. But the results reported here suggest that the apparent effect of majority party capacity uncovered by Binder may largely be an artifact of its relationship to change in the floor median. Although the majority party's unity and seat share appear to have a measurable influence on the adoption of partisan rules changes when the floor median is omitted from the analysis, including change in the median generally negates the effects of these variables and contributes significantly to the predictive accuracy of the model. Party capacity is significant in model 2 of Table 3, but its effect appears somewhat fragile.

Party government models of rules changes are premised on the assertion that the majority party is able, under certain circumstances (such as when it is homogeneous), to bind swing voters to its side on controver-

One might argue that the period covered should be split into even finer categories to capture the ebb and flow of partisan influence, since partisan variables may fare better during eras when parties are stronger, such as 1890–1910, than in other years. But splitting the period into shorter time spans is difficult to justify theoretically: Each theory assessed in this article aims to generalize about the determinants of legislative organization across time. The theories would be of extremely limited use if they were applicable only to sharply delimited time spans. The findings reported here suggest that the ideological power balance model successfully explains variation in legislative rules across an extended period.

sial rules votes (Cox and McCubbins 1994, 221). The success of the ideological balance of power model in explaining House rules changes and the general failure of party-based variables to do so suggests that the median voter on the floor has been free to unite with members of either party to enact new rules. Indeed, it has been relatively common for cross-party ideological coalitions to form and pursue their substantive agendas through amendments to House rules. The 1910 coalition of Democrats and dissident Republicans that overthrew Speaker Cannon, thereby providing an important boost to the growing Progressive movement in the House and the nation at large (Holt 1967), was hardly an aberration. In much the same way, the repeated battles over the discharge rule in the 1920s pitted conservatives against progressives (Beth 1994; Cooper [1960] 1988), and the clashes over the role of the Rules Committee in the 1940s-60s pitted conservatives drawn from both parties against liberal Democrats and their northeastern Republican allies (Bolling 1968).

Indeed, the battles over the discharge rule and Rules Committee illustrate the role of changes in the floor. median. In both cases, liberals (or, in the 1920s, progressives) repeatedly engaged conservatives in conflicts that turned on the ideological balance of power on the floor. Following large Democratic gains in the 1922 election, Democrats and progressive Republicans held a slim floor majority in the new 68th Congress (1923-25). The median, which had been nearly identical to the GOP median in the preceding Congress, shifted by more than one-third of a point toward the Democrats (refer to Figure 2). Soon after the opening of the 68th, Democrats and progressive Republicans united to pass rules changes that loosened GOP control of the flow of business to the floor (Cooper [1960] 1988). In 1925, after large gains by conservative Republicans in the 1924 election, the floor majority shifted back in their favor. Now, the floor median was 38 closer to the Republican than to the Democratic median. The new conservative majority tightened GOP leaders' agenda control by repealing the liberalized discharge rule adopted in the 68th Congress. Much the same pattern emerged in fights over the 21-day rule. Large Democratic seat gains in 1948 and 1964 gave liberals a floor majority, which shifted the floor median closer to the Democratic than to the GOP median. This led to adoption of the promajority 21-day rule in 1949 and 1965. GOP gains in 1950 and 1966 gave conservatives a floor majority, which shifted the floor median back toward the Republican median. As noted above, the nominal Democratic floor majorities that remained were unable to block repeal of the 21-day rule in 1951 and 1967.39

The basic conclusion is that a parsimonious explanation for partisan rules changes can be found in the ideological balance of power on the floor. As paradoxical as it may seem, a relatively nonpartisan model, based on change in the floor median, generally does a better job than explicitly partisan models in explaining rules changes that have significant partisan overtones.

This paradoxical conclusion should not be taken too far. The finding that changes in party polarization have played a significant role in recent years suggests that conditional party government models can add to our understanding of rules changes, particularly in this era of highly polarized parties. Furthermore, although change in the floor median appears to offer the best understanding of House rules changes, it may not be as potent an explanation for many other features of legislative organization. 40 For example, it is plausible that other variables—including party homogeneity—do a better job of explaining changes in internal party organization and in committee assignment practices. Unlike House rules, these do not necessarily require a vote of the full House and therefore may be less susceptible to influence by the median voter. Rohde (1991) convincingly argues that as the Democrats became increasingly unified in the 1970s and 1980s, they better used their caucus to form policy positions and were more aggressive in employing committee assignments to reward party supporters and sanction defectors. A critical issue for future research is to determine the extent to which the floor median constrains the majority party's ability to use caucus rules changes to obtain favored outcomes on the House floor.

Still, the evidence presented here strongly suggests that at least in the realm of legislative rules the ideological balance of power on the floor is a potent force limiting the majority party's ability to adopt changes that serve its shifting interests. More than three decades ago, Jones (1968) drew attention to the limitations placed upon party leaders by their need to maintain a procedural majority on the floor. This analysis of partisan rules changes over 132 years reinforces and extends his insight. To a substantial degree, House rules reflect and respond to an underlying ideological power balance on the floor that can be captured by a relatively simple spatial model (Black 1958; Downs 1957). As the floor median moves toward the majority party, its leaders can shape rules that enhance the party's agenda control; when the median moves away from the majority party, cross-party coalitions are well positioned to shift rules and procedures in ways that respond to the new ideological power balance.

³⁹ See Froman 1967, 97-9, for a discussion of how the 1965 version

of the 21-day rule, in particular, strengthened the Democratic leadership while it was (briefly) in effect.

⁴⁰ But see King 1997 and Schickler and Rich 1997a for evidence that the majority party typically does not control another key aspect of legislative institutions, committee jurisdictions

APPENDIX A: CONGRESSES WITH RULES CHANGES THAT HAD SIGNIFICANT PARTISAN OVERTONES

TABLE A-1.	Coding of Rules Changes	j
Congress	Code Rule Change	
40 (1868)	+1 Limited dilatory motions pending a vote on motion to suspend the rules	
43 (1874, 1875)	+1 Required majority to second a motion to suspend rules; sharply limited dilatory motions	
44 (1875, 1876)	0 Repealed rules changes from 43d Congress (-1); adopted Holman rule on appropriations bil	II ridera (+1)
46 (1880)	0 Required debate on rules suspensions and previous question (-1); reinstated seconding of r suspensions motions (+1)	гиюв
47 (1882, 1883)	+1 Limited dilatory motions in contested election cases, allowed rules suspensions by majority valued bills	vote for
51 (1890)	+1 Reed rules: abolished disappearing quorum; restricted dilatory motions	1 * 1
52 (1891, 1892)	0 Repealed Reed rules (-1); increased Rules Committee prerogatives and restored Holman rule	le (+1)
53 (1894)	+1 Beedopted Reed's disappearing quorum rule ,	` ,
54 (1896)	+1 Readopted remainder of Reed rules .	
60 (1909)	-1 Created Calendar Wedneeday	
61 (1909, 1910)	 Strengthened Calendar Wedneeday; created discharge process, motion to recommit guarant minority; enlarged Rules Committee 	eed for
82 (1911)	+1 Tightened germaneness requirement on revenue bills; restored Holman rule	
64 (1916)	-1 Amended Calendar Wednesday process to make more workable	
38 (1924)	-1 Liberalized discharge rule; loosened germaneness rule on revenue bills	•
9 (1925)	+1 Repealed discharge rule from 68th Congress	
7 2 (1931)	-1 Liberalized discharge rule; loosened Speaker control over discharging conferees	
'3 (1933)	+1 Made reports from Rules Committee nondivisible	•
74 (1935)	+1 Discharge petition signatures raised to 218	
79 (1945)	-1 House Un-American Activities Committee granted standing committee status	
31 (19 49)	+1 21-day rule adopted, making it easier to bypass Rules Committee	
32 (1951) [;]	1 21-day rule repealed	
37 (1961)	+1 Rules Committee expanded from 12 to 15 members	
39 (1965)	+1 21-day rule adopted; limited obstruction factics	' r
0 (1967)	-1 21-day rule repealed	
91 (1970)	O Protections for minority (e.g., staffing funds) in Reorganization Act (-1); reading of Journal divided with, unless ordered by a majority (+1)	spensed
12 (1971)	+1 Minority party guarantee of committee investigatory staff funding eliminated	
3 (1973)	+1 Limits on minority obstruction; various devices adopted to expedite business	
94 (1975, 1976)	+1 Eliminated proxy voting ban in committee; eliminated 1974 guarantee of one-third of funds for investigatory staffing; Rules Committee can walve requirement for 2-hour availability of cor- reports; abolished House Un-American Activities Committee	or minority Inference
95 (1977) ,	+1 Increased number of days for rules suspensions; Ilmited obstruction tactics; abolished Joint (Committee
6 (1979)	+1 Increased threshold for demanding a recorded vote; limited obstruction tactics	
8 (1983)	+1 Limited riders to appropriations bills	
02 (1991)	+1 Senes of changes, including requirement that any legislation with direct spending or revenues binding Congressional Budget Office estimate for "pay as you go" sequestration	s include a
03 (1993)	O Package of changes allowing delegates to vote in Committee of the Whole and allowing com to declare a quorum once a majority of members had been present for some part of sessic eliminated three select committees, made public the names of members who sign discharge p	on (+1):
104 (1995)	+1 Eliminated three committees; required supermajority for tax increases; several additional char opening of session (see Evans and Oleszek 1997)	nges at

Note: Coding Issues. Binder's (1996) alternative coding excludes cases that I identify in the 54th, 64th, 73d; 79th, 81st, 82d, and 87th Congressee I exclude the prominonty change identified by Binder in the 65th Congress, which made party committee states nondrivisible, because it was done to protect both parties from attacks on the floor. Floor debete and secondary sources each suggest that members saw the change as neutral with respect to the majority and minority parties (see, e.g., Hasbrouck 1927). The only other coding difference is that I code the 93d Congress as having promagority changes, whereas Binder codes it as having both promajority and prominority changes (she does not assess the relative importance of the changes, but the main minority party victory, a minimum staffing guarantee, was not implemented). Binder does not code Congresses after 1990

Binder (1996) estimates separate models to predict the suppression of minority rights. She assigns each Congress two dummy variables. The first is coded 1 if a rule oreating a new minority right was adopted in that Congress, 0 otherwise. The second is coded 1 if a rule suppressing an exetting minority right was adopted in that Congress, 0 otherwise. I combine these two variables into a three-point scale. Each Congress is accred +1 if a minority right was suppressed but no new ones were created; -1 if a minority right was created and no existing rights were suppressed; and 0 if no relevant rules changes were adopted or if a package of changes was adopted that both created and suppressed minority rights. When the analyses in Appendix C are replicated using Binder's dummy variable for minority rights suppression, the results are substantively similar to the estimates when the three-point scale that includes both suppression and creation of minority rights is used.

It is also worth highlighting a handful of difficult coding decisions. One concerned the expansion of the House Rules Committee. This promajority change was adopted in 1961 but applied only to the 87th Congress (1961–63). Two years later, the enlargement was made permanent I counted the 1961 change but not the 1963 decision, which perpetuated the status quo created in 1961 (i.e., the 1963 rule did not alter the composition of the Rules Committee, the 1961 change altered its composition in the Democratel favor). I estimated all the models presented here using both 1961 and 1963 as promajority changes and using only 1963. The coefficient estimates did not offend these as "minor" and did not suggest that the new rules had significant parties overtones. Therefore, consistent with my coding of other Congresses, I scored this Congress as a "0," but I also resstimated the models recoding this case as a promajority change. None of the coefficient estimates changed appreciably.

APPENDIX B: MEASUREMENT OF INDEPENDENT VARIABLES

Independent Variables

The following measures were used to operationalize the independent variables.

- ΔHOMOGENEITY = HOMOGENEITY (t) HOMO-GENEITY (t - 1), where HOMOGENEITY is the standard deviation of first-dimension DW-NOMINATE scores for majority party members divided by the standard deviation of all House members' first-dimension DW-NOMINATE scores.
- 2. ΔHOMOGENEITY IN TWO DIMENSIONS is change in the average distance (using D-NOMINATE scores) in two dimensions across all pairs of majority party members (see Poole and Rosenthal 1997, 82, 269). This measure has only been calculated using D-NOMINATE scores, and it covers only the years 1879–1988. As a result, the models using this measure were restricted to that period.
- SWITCH_{DEM} is a dummy variable scored 1 if the previous Congress was Republican and the present Congress is Democratic, 0 otherwise.
- SWITCH_{REP} is a dummy variable scored 1 if the previous Congress was Democratic and the present Congress is Republican, 0 otherwise.
- 5. PARTY CAPACITY = CAPACITY_{MAJ} CAPACITY_{MIN}, where $CAPACITY_{MAJ} = (MAJPCT) \times (MAJCOHESION)$, $CAPACITY_{MIN} = (MINPCT) \times (MINCOHESION)$,

MAJPCT = % of seats held by majority party,

MINPCT = % of seats held by minority party,

MAJCOHESION = Rice cohesion score for majority
party members, and

MINCOHESION = Rice cohesion score for minority party members.

 PARTY CAPACTTY-DW: Same as PARTY CAPACTTY, except replace MAJCOHESION and MINCOHESION with:

MAJCOHESION_{NOMINATE} = $1/\sigma_{maj}$, where σ_{maj} = the standard deviation of majority party members' first-dimension DW-NOMINATE scores.

MINCOHESION_{NOMINATE} = $1/\sigma_{mm}$, where σ_{mm} = the standard deviation of minority party members' first-dimension DW-NOMINATE scores.

7. Δ POLARIZATION = POLARIZATION (t) - POLARIZATION (t-1), where

POLARIZATION = $abs(MEDIAN_{MAJ} - MEDIAN_{MIN})$, where

MEDIAN Majority party median, and MEDIAN Minority party median.

8. ΔΜΕDΙΑΝ_{ADV} = MEDIAN_{ADV}(t) - MEDIAN_{ADV}(t - 1), where

MEDIAN_{ADV} = abs(MEDIAN_{floor} - MEDIAN_{min}) - abs(MEDIAN_{floor} - MEDIAN_{may}), and

MEDIAN_{floor}: Floor median, dimension 1, DW-NOMINATE.

An example illustrates how the measure is calculated. In the 89th Congress (1965–66), the estimated floor median was -.075; the Democratic majority's median stood at -.250, and the Republican minority's median was .200. From the equation above,

MEDIAN_{ADV (89th)} = abs(
$$-.075 - .200$$
) - abs($-.075 - .200$) = .10.

Following GOP gains in the 1966 elections, the floor median in the 90th Congress shifted to the right, standing at .040; the majority Democrats' median was -.239, and the Republicans' median shifted to .190. Thus,

MEDIAN_{ADV (90th)} = abs(.040 - .190)
- abs(.040 -(- .239)) = -.129, and

$$\Delta$$
MEDIAN_{ADV (90th-89th)} = -.129 - .100 = -.229.

The 1950 elections shifted the floor median so that, whereas it had been .10 closer to the majority party median than the minority median in 1965–66, it now stood .129 closer to the minority party than the majority party median.

In addition to the measure for change in the median described above, I replicated the analysis substituting a simpler measure:

$$\Delta \text{MEDIAN}_{\text{floor}} = \text{MEDIAN}_{\text{floor}}(t) - \text{MEDIAN}_{\text{floor}}(t-1),$$
 when Republican majority at time t ,
$$= (-1) \times [\text{MEDIAN}_{\text{floor}}(t) - \text{MEDIAN}_{\text{floor}}(t-1)],$$
 when Democratic majority at time t .

This has the drawback that it tends to take on an extreme value whenever a change in party control occurs, even if the new median is no closer to the position favored by the new majority party than the old median had been to the position favored by the outgoing majority. Nonetheless, it produces similar results to the estimates when the more complicated measure is used. The one caveat is that it requires dummy variables taking into account switches in party control to the Democrats or the Republicans, whereas such controls make no difference when the more complicated measure is used.

Use of Nominate Scores

A final issue concerning measurement is the use of DW-NOMINATE scores. These are virtually identical to the more well-known D-NOMINATE scores (see McCarty, Poole, and Rosenthal 1997). The two sets of scores correlate at higher than .92. The primary advantage of DW-NOMINATE scores is that they have been calculated through the 105th Congress, while D-NOMINATE scores have only been calculated through the 100th Congress (1987–88). When D-NOMINATE scores are used (this requires restricting the analysis to 1867–1988), the coefficients for party polarization and party capacity are reduced in size and become statistically insignificant, although the floor median remains strong and significant in each specification.

It is essential that both D-NOMINATE and DW-NOMINATE scores are designed to be comparable over time. More specifically, the location of individual members in the issue space is allowed to change over time only through a linear trend parameter for that member. This restriction also means that the location of a specific member is not solely a function of his or her votes in the present Congress. As a result, the homogeneity measure for a given Congress is based on information from all the Congresses in which members of that Congress served. This makes it more plausible to argue that the dispersion of members' ideological positions measures majority party homogeneity and is not simply a function of the majority party's actual record of success on the roll calls taken in that Congress. The party's record of success, of

course, might be endogenous, as it could be shaped in part by the rules adopted at the beginning of each Congress. This makes it all the more important to use measures of homogeneity, such as DW-NOMINATEs, that are not simply a function of the majority party's success rate in the particular Congress under examination.

Rice cohesion scores, by contrast, are calculated for each party based on all roll calls conducted in a given Congress. The scores are the mean absolute difference of the percentage of party members voting "yes" and the percentage of party members voting "no" over all the roll calls. I am wary of using Rice cohesion scores to measure party homogeneity, since they do not purport to measure individual members' preferences and may closely reflect the party's actual success in maximizing its voting unity. DW-NOMINATE scores are also calculated based on the roll call record, and thus are somewhat vulnerable to a similar critique, but they are less vulnerable because of the constraint on change in individual members' scores across Congresses.

One might object that it is inappropriate for DW-NOMINATE scores to include a member's entire voting history from preceding Congresses in calculating that member's ideology score in the present Congress. This could be a problem if a member's voting behavior changes markedly in the same Congress that major rules reforms are adopted. While Poole and Rosenthal (1997) show that it is quite rare for members' voting behavior to change appreciably over time, I nonetheless sought to avoid this potential difficulty by considering a measure for majority party homogeneity derived from Cox and McCubbins (1993, 149): They examine party loyalty scores on "party agenda votes" for each post-World War II Congress. Substituting this measure had little effect on the results. Indeed, during that period, the measure of homogeneity based on party agenda votes is less closely related to partisan rules changes than is the homogeneity measure based on NOMINATE scores.

Varlable	Theory (expected slgn)	Model 1a	Model 2a	Model 3a	Model 4a	Model 5a	Model 6a
∆MEDIAN _{ADY} (change in median)	Median voter (+)	7.380** (2.111)	7.947** (2.253)	6.735** (1.967)	6.946** (2.028)		13.224** (4.935)

The Political Economy of Expenditures by the Peruvian Social Fund (FONCODES), 1991–95

NORBERT R. SCHADY The World Bank

The Peruvian Social Fund (FONCODES) was created by President Alberto Fujimori in 1991 with the stated objectives of generating employment, alleviating poverty, and improving access to social services. This article uses province-level data on monthly expenditures, socioeconomic indicators, and electoral outcomes to analyze political influences on the timing and geographic distribution of FONCODES expenditures between 1991 and 1995. I reach three main conclusions. First, these expenditures increased significantly before national elections. Second, FONCODES projects were directed at provinces in which the marginal political effect of expenditures was likely to be largest. Third, these projects favored the poorest provinces, which suggests that the program also had a redistributive function. The results are robust to a large number of specifications and controls. The Peruvian data support predictions made in the literature on political business cycles as well as the literature on political influences on the allocation of discretionary funds.

o incumbents use social programs to get themselves reelected? There is a longstanding debate about the extent to which politicians can successfully manipulate the economy to coincide with elections. The traditional political business cycle literature predicts increases in expenditures before an election (Nordhaus 1975; Tufte 1978). A fundamental assumption underlying these early models—that voters are myopic and cannot see what motivates politicians—was brought into question with the advent of rational expectations theory. Since then, however, more sophisticated models have been developed, some of which lead to political budget cycles even in the face of fully rational voters.¹

The empirical evidence from less developed countries (LDCs) tends to support the predictions made in the political business cycle literature. In a study of 17 Latin American countries over 35 years, Ames (1987) shows significant increases in total public sector expenditures in electoral years. More recently, Schuknecht (1996) finds further evidence for political business cycles in a study of 35 countries between 1970 and 1992. One partial exception to this body of evidence is Remmer (1993), who uses recent data from six Latin American countries to argue that economic conditions generally deteriorate in the period leading up to an election and improve thereafter. This suggests that politicians may try to manipulate macroeconomic vari-

ables but are often unsuccessful, an argument also made for Western Europe (Lewis-Beck 1988). A related issue, which has not been resolved in the empirical literature, is whether voters in LDCs actually reward politicians for what Rogoff (1990, 21) calls their "preelection budget antics" (Dornbusch and Edwards 1991; Stokes 1996a).

There is also considerable controversy about the strategy a rational incumbent should follow with regard to the geographical distribution of expenditures. Much of the debate revolves around the relationship between voting patterns, on the one hand, and ideological preferences, income levels, and net transfers, on the other.

Theories of the determinants of voting behavior often consider the affinity of voters for different candidates (an "ideological" component) and the changes in welfare that voters can expect to see after an election (an "economic" component) (Dixit and Londregan 1996; Landon and Ryan 1997; Lindbeck and Weibull 1987; Markus 1988; Peltzman 1990). Incumbents can (obviously) increase their standing in voters' eyes with policies that improve overall welfare—economic growth, broadly speaking. Yet, they also can choose to favor some voters over others by being selective with taxes and transfers. How should a rational incumbent distribute taxes and transfers across the electorate? The answer clearly depends on whether a given level of net transfers sways some voters in favor of the incumbent more easily than others.

Define R_i to be the change in the probability that voter i will vote for the incumbent as a result of a unit change in net transfers. R_i is therefore a measure of the "political productivity" of net transfers to different voters:

$$R_i = g(y_i, a_i), \tag{1}$$

where y_i is income, and a_i is a time-invariant measure of the "affinity" between voter i and the incumbent. This affinity could include voter i's perception of the incumbent's character, or the ideological proximity between voter i and the incumbent. I assume that the

Norbert R. Schady is an Economist at The World Bank, 1818 H Street N.W., Washington, DC 20433 (nschady@worldbank.org).

An earlier version of this article appeared as a World Bank Policy Research Working Paper 2166 (August 1999). I thank particularly Christina Passon for much useful advice; Harold Alderman, Helge Berger, Jean Borvin, Anne Case, Gaurav Datt, Angus Deaton, Avinash Drott, Edmundo Murrugarra, Susan Stokes, Chang Tal-Hsieh, Mark Thomas, and John Waterbury; participants at the Northeast Universities Development Conference held at Yale University on October 16–17, 1998; participants at seminars held at Princeton University and The World Bank; and two anonymous referees for helpful comments The views and interpretations expressed in this article are those of the author and do not necessarily represent the views and policies of the World Bank.

¹ A useful summary of competing perspectives can be found in Alesina and Roubins, with Cohen, 1997.

parameter a_i ranges from $-\infty$ to ∞ , which represent strong dislike and like for the incumbent, respectively.

There are numerous competing theories about the relationship between a_i and R_i . Cox and McCubbins (1986) argue that R_i is largest when transfers are made to voters with a value of a_i that is large and positive. There are two key insights here. First, incumbents may be risk averse. Transfers by incumbents to core supporters, whose needs and preferences they understand well, are likely to be a safer investment than transfers to other (unknown) voters. Second, administrative costs and inefficiencies limit the fraction of transfers that actually materializes as a benefit to voters. This fraction may be higher when incumbents make transfers to core supporters.

Lindbeck and Weibull (1987) argue that R, is largest when transfers are made to swing or marginal voters with a value of a_i close to zero. The intuition behind this result is that transfers to voters who strongly favor (oppose) the incumbent are unlikely to make a difference, as these voters will probably vote for (against) the incumbent regardless of the transfer. Lindbeck and Weibull extend their model to consider cases in which politicians seek to maximize the probability of being reelected rather than the expected number of votes. Under these circumstances, if candidates are not equally popular, Lindbeck and Weibull show that supporters of the more popular candidate are more likely to be pivotal voters who can decide the outcome of the election. For any two values of a_i , that are identical in magnitude but opposite in sign (αa_{ij}) αa_i), incumbents therefore should favor supporters of the candidate who is more popular.

Dixit and Londregan (1996) suggest that the choice between a strategy that favors swing voters and one that favors core supporters depends on whether incumbents can collect taxes and distribute benefits more effectively among their supporters. In general, rational incumbents should favor swing voters when there are no such differences, but core supporters when there are.²

The discussion above implies that incumbents can observe the individual a_i directly. This is obviously unrealistic, but incumbents may be able to approximate voter preferences by looking at geographic patterns in previous elections. For example, they can assume that all voters in a province are identical or, more plausibly,

that the distribution of preferences differs systematically across provinces. It can be shown that the probability a randomly selected voter in province d voted for a party j is equivalent to the share of the vote for party j in that province (Deacon and Shapiro 1975). Voters in provinces in which 50% of the population voted for the incumbent in the last election are most likely to be marginal: The probability that they supported the incumbent is exactly the same as the probability that they supported other candidates. The same logic applies to core supporters, who are most likely to be found in provinces that voted heavily for the incumbent.

One also may consider dynamic models in which politicians reward fickle voters. Take the example of an incumbent who has already survived (at least) one reelection. One strategy for this two-time incumbent would be to buy back traditional supporters who have recently favored opposition candidates—either because it is cheaper or less risky to bring them back into the fold or because there are long-term benefits to having a stable base of support.³ Alternatively, a twotime incumbent can attempt to consolidate his position among voters who backed him for the first time. Comparing the results from two or more past elections enables an incumbent to identify provinces in which voters are most likely to have switched their support. Where politicians are clearly associated with their parties, incumbents also may be able to extract information by comparing the vote for their party in the two most recent elections.

What about the relationship between the political productivity of transfers and income? If there is diminishing marginal utility of income, voters with low initial levels of income should benefit more from a given transfer than their wealthier counterparts. Therefore, the political productivity of transfers to the poor should be higher (Dixit and Londregan 1996; Lindbeck and Weibull 1987). If the poor are less likely to vote than the nonpoor, however, the negative correlation between R_i and y_i may be dampened or become positive (Cox and McCubbins 1986; also Fleck 1994). Note, finally, that a negative correlation between y_i and transfers also can be explained by an altruistic parameter in the incumbent's utility function, a possibility that is discounted in all these models.

In this article, I use data on voting patterns and social expenditures from Peru in the early 1990s to analyze the influence of elections on the timing and distribution of expenditures made by the Peruvian Social Fund (Fondo Nacional de Compensación y Desarrollo Social—FONCODES) during President Alberto Fujimori's first term (1990-95). FONCODES

² The Dixit and Londregan (1996) model focuses on groups of voters (e.g., garment workers or senior crizens). In this context, Dixit and Londregan propose two additional parameters that should affect the decision to favor some groups over others. First, for any given value of a_{ij} some groups are more willing than others to compromise on their ideological preferences in exchange for material rewards. Groups less attached to their ideology should expect to receive higher transfers. Second, for any two groups with a mean value of a, equal to zero, one will likely have a larger variance (m statistical terms) m a, than the other. The lower variance group will have a larger concentration of voters with a value of a, close to zero. A given level of transfers will induce more members of this group to switch their vote, and they will therefore be favored by rational incumbents. In practice, these two additional parameters cannot be identified with data on electoral outcomes and expenditures, and I do not consider them further.

³ I thank an anonymous referee for this suggestion. Note that this is a different use of the term "buy back" from that found in numerous other works (e.g., Bruhn 1996; Gershberg 1994), where buy back refers simply to the negative coefficient on a regression of expenditures on the level of the progovernment vote in the most recent election, rather than the negative coefficient on the change in the progovernment vote. Insofar as the vote on this most recent election is not compared to the vote in a prior election, however, there is no way of telling whether these voters are being bought back or wooed for the first time.

was created in 1991, during the severe recession that followed the adoption of stringent stabilization and structural adjustment measures by the Fujimori government. Its stated objectives were to generate employment, alleviate poverty, and improve access to social services (World Bank 1998). By 1993, the Peruvian economy had begun a remarkable recovery, and FON-CODES was being hailed by government officials and foreign donors alike as an important component of a medium-term strategy to reduce poverty.

Scholars in Peru and abroad have generally been more guarded in their praise. Critics argue that social funds like FONCODES undermine line ministries and local governments, and questions about the "politicization" of FONCODES have bedeviled the program from its creation (Ballón and Beaumont 1996; Graham 1994; Kay 1996; Weyland 1998). Yet, there are no satisfactory studies of the influence of elections on FONCODES expenditures.⁴

This article attempts to fill that gap using highly disaggregated data on expenditures, socioeconomic indicators, and electoral outcomes. I use econometric techniques to analyze the timing and geographic distribution of FONCODES expenditures, and I reach three main conclusions. First, these expenditures increased significantly before national elections. Second, FONCODES projects were directed to provinces in which their marginal political effect was likely to be largest. Between 1991 and 1993, FONCODES expenditures favored core supporters and marginal voters. After a disappointing result in a national referendum held in 1993, however, the Fujimori administration redirected resources in an attempt to buy back the vote in turncoat provinces. Third, FONCODES projects favored the poorest provinces, which suggests that the program also had a redistributive function. My results, which are robust to a large number of specifications and controls, show that the kind of targeted povertyalleviation programs which have become increasingly widespread in Latin America and elsewhere may be particularly vulnerable to political interference.

The rest of the article proceeds as follows. After providing a brief description of Peruvian politics between 1990 and 1995 and of FONCODES, I describe data requirements and sources for this study. I then estimate the effect of the electoral calendar on the timing of FONCODES expenditures as well as the effect of the 1990 presidential election and the 1993 referendum on the distribution of expenditures. I conclude with some general thoughts on the use of social expenditures for electoral purposes.

THE FUJIMORI YEARS AND FONCODES

The election of the dark horse Alberto Fujimori to the presidency in 1990 marked the beginning of a fundamental transformation of Peruvian politics. Fujimori, an independent with no significant party organization,

defeated the center-right coalition headed by the well-known novelist Mario Vargas Llosa. Fujimori's party did not win a majority in either house of the Peruvian congress. Blaming "corrupt" institutions for his inability to introduce a coherent economic program or combat the terrorist insurgencies of Shining Path and the Túpac Amaru, Fujimori used the military to shut down congress and the judiciary in April 1992. Under international pressure to restore democracy, he drafted a new constitution, which was approved by a small margin in a referendum held in October 1993, and won a landslide reelection to the presidency and a majority for his party in the new unicameral congress in April 1995.

The academic literature on Peru argues that traditional sources of authority and intermediation between citizens and the state have been weakened under Fujimori (Cameron 1994; Conaghan 1996; Mauceri 1995; Seddon 1997). The "historical" political parties have all but disappeared.5 The legislative and judicial branches have not acted as an effective check on the executive. There also have been important changes in the relationship between various levels of government and in the conduct of social policy. Decree 776, passed in December 1993, abolished most sources of tax revenue traditionally used by municipal governments. Responsibility for the administration of numerous social and basic infrastructure programs has been transferred from local governments and line ministries in education, health, and transportation to the Ministry of the Presidency. By 1995, this ministry controlled more than 20% of the central government budget and oversaw thirteen programs involved in, among other things, nutrition, education, health, water, sanitation, and housing (World Bank 1996, 2).

FONCODES is one of the new programs created by Fujimori. Its charter establishes it as an "autonomous body" outside the traditional line ministries. By law, the FONCODES executive director reports directly to a five-member board of directors appointed by the president. This institutional arrangement raised concerns that FONCODES could easily become a means for dispensing pork, and these misgivings were reinforced when Luz Salgado, a former secretary general of

⁴ Moncada (1996) and Graham and Kane (1998) discuss the timing and distribution of FONCODES expenditures, respectively. As I discuss below, however, both works have serious limitations.

The four major parties that dominated civilian politics in Peru for decades have become irrelevant These four—the conservative Popular Christian Party, the center-right Popular Action, the center-left Alianza Popular Revolucionaria Americana (APRA), and the left-wing United Left—jointly garnered 82.2% and 97% of the vote in the presidential elections of 1980 and 1985, respectively. In the 1995 presidential election they won only 6.3% of the vote (Jurado Nacional de Elecciones 1995; Tuesta Soldevilla 1994). Cambio 90-Nueva Mayoría, Fujimori's party, has no outstanding leaders other than the president himself. Independent candidates with no party affiliation have dominated local politics. In the 1993 municipal elections, for example, independents received almost two-thirds (64.7%) of the votes cast (Tuesta Soldevilla 1995, 106).

The législature, where Fujimori's party has had an absolute majority since 1992, rubber-stamps the president's initiatives; on the only important occasion on which the Corte Suprema contravened Fujimori's wishes, ruling that a draft law which would allow Fujimori to run for a second reelection in 2000 was unconstitutional, the three members who voted with the majority opinion were dismissed from the beach.

Fujimori's Cambio 90 Party, was appointed the first executive director (Graham 1994, 108–9; Kay 1996, 79). Subsequent directors were recruited from the private sector (Arturo Woodman, Alejandro Afuso) and from other branches of government (Manuel Estela, Manuel Vara Ochoa), which helped dispel some of the initial concerns. Over time, FONCODES has improved coordination in the planning, execution, operation, and maintenance of projects with the line ministries and, to a lesser extent, with local governments and nongovernmental organizations (NGOs).

Between December 1991 and May 1995, FON-CODES funded almost 16,000 community-based projects, for a total budget of about 465 million soles.⁷ At the 1992 exchange rate, this was equivalent to roughly \$285 million (U.S. dollars). The average project size was quite small—about \$18,000 (U.S. dollars). These community-based endeavors include nutrition and family planning projects, rotating credit schemes, and projects for the construction or rehabilitation of schools, health posts, water and sanitation systems, rural roads, electrification schemes, and smallscale irrigation works. In addition, FONCODES has executed a series of centrally designed "special" projects, including a school breakfast program, the distribution of uniforms for schoolchildren, shovels for farmers, and motorized canoes for isolated jungle communities. Between December 1991 and May 1995, FONCODES spent about 135 million soles (roughly \$83 million in U.S. dollars) on these special projects. In 1993, FONCODES expenditures accounted for roughly 0.55% of GNP—more or less in the same order of magnitude as the Solidarity program in Mexico, which accounted for about 0.71% of GNP in 1992.

FONCODES has much in common with other social funds in the region (Glaessner et al. 1994). The bulk of its projects are demand driven and targeted. FONCODES' community-based projects (but not the special projects) are demand-driven in that communities choose a project from a menu and prepare a proposal for funding. FONCODES then functions as a financial intermediary: Rather than execute projects itself, it approves proposals and releases funds to the *núcleo ejecutor*, a group of community members elected specifically for this purpose. FONCODES also targets its investments, first by using a "poverty map" to assign resources to small geographic areas and then by conducting an informal on-site assessment of the poverty of the community requesting a project.8

THE DATA SET

In 1997, Peru was divided into 13 administrative regions, 24 departments, 194 provinces, and 1,812 districts (Webb and Fernández Baca 1997, 112). Regions and departments are administrative arms of the central

government, which appoints a governor for every region. Provincial and district-level mayors are chosen at municipal elections every three years. Data on FON-CODES expenditures, socioeconomic characteristics, and voting patterns are available at different levels of geographic aggregation.

FONCODES keeps monthly records on the number of projects and aggregate amounts spent in each district. Three points are worth noting about these data. First, because expenditures are recorded in the month in which a project is approved, there is a lag of about two weeks before disbursement of the first funds and of several months before the second (and final) disbursement. Second, only expenditures on projects are included, not administrative costs or general overhead. Third, district-level information on the distribution of funds is only available for the community-based projects. There is no information on allocation formulas or actual fund distribution for the special projects.

The Peruvian National Statistical Institute (Instituto Nacional de Estadística e Informática—INEI) has estimated population size, the proportion rural, and a host of socioeconomic indicators at the district level. Most of these indicators are based on a population and housing census conducted in 1993. The one important exception is the rate of chronic malnutrition, which is based on a census of height and weight among school-children also conducted in 1993.

The Jurado Nacional de Elecciones, the body that supervises elections in Peru, keeps records on elections held since 1990. Some of these data have been compiled and published (Jurado Nacional de Elecciones 1995; Tuesta Soldevilla 1994). Results are generally available for all provinces in the country and for all districts in metropolitan Lima.

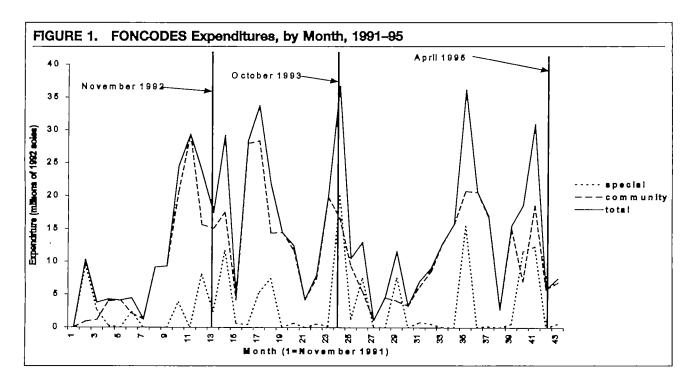

The level of aggregation used for the analysis in this article was dictated by theoretical considerations and the availability of data. The next section uses national aggregates of FONCODES expenditures to analyze the relationship between the timing of expenditures and the electoral calendar. Sources of funding for and the administration of the community-based and special projects are different, so the analysis is broken down by project type. FONCODES has assigned resources to individual provinces since 1993 and to individual districts since 1996. The following section uses a provincelevel data set to analyze the influence of electoral outcomes on the geographic distribution of FON-CODES expenditures for community-based projects. To avoid having one data point account for 5.78 million inhabitants—more than one-quarter of the population of the entire country—the province of metropolitan Lima has been further divided into its districts. The term "province" is used throughout to refer to these metropolitan districts and to national provinces.

THE TIMING OF FONCODES EXPENDITURES

Is there evidence of a political cycle in FONCODES expenditures? Figure 1 graphs monthly data for the amounts approved for community-based and special

⁷ All expenditures are in constant 1992 soles, unless otherwise indicated.

Note, however, that even without political interference actual expenditures in a given province rarely would be equal to allocations because of the demand-driven nature of the program.

projects between November 1991 and May 1995.9 The chart shows that expenditures are highly irregular, especially (but not only) for the special projects. There are at least five distinct spikes in total expenditures. Three of these coincide with periods immediately before three national elections: the November 22, 1992, election to the constituent assembly (month = 13); the October 31, 1993, referendum (month = 24); and the April 9, 1995, presidential election (month = 42). Figure 1 provides some prima facie evidence that the timing of FONCODES expenditures was affected by elections.

To formally test the possible effect of the electoral calendar on expenditures, I estimate a series of regressions of the following form:

$$\operatorname{Exp}_{t} = \alpha + \beta \operatorname{Elec}_{t} + \chi z_{t} + u_{t}, \tag{2}$$

where Exp_t stands for FONCODES expenditures in time t; Elec, is a dummy variable for the presence (or absence) of an election in the three previous months; z_t is a vector of exogenous variables that affect expenditures, including a linear time trend and quarterly dummies; and u_t is the error term. If expenditures are timed to coincide with elections, we would expect the parameter β to be positive. Note that this formulation assumes that the timing of elections is exogenous. Insofar as it is easier to manipulate the timing of FONCODES expenditures than the timing of elections, this is a reasonable assumption.

Table 1 reports results of OLS regressions of expen-

ditures both in total and broken down for community-based and special projects. Columns 1, 3, and 5 report results from the regressions of expenditures on a single electoral dummy variable; columns 2, 4, and 6 include three separate electoral dummies to allow the effect of elections on expenditures to vary by election. All estimates are corrected for serial correlation in the error term using the Cochrane-Orcutt (1949) procedure.

The results in Table 1 confirm the general picture in Figure 1. The electoral parameter in columns 1, 3, and 5 is positive and significant at the 5% level or better in all three specifications. This suggests that expenditures on both community-based and special projects were significantly higher than expected in the three months leading up to elections. When the three elections enter into the regression separately, their influence on the timing of expenditures is most apparent for the special projects, especially for the October 1993 referendum and the April 1995 presidential election.

The changing political context in Peru may explain differences in the effect of elections on FONCODES expenditures. The Fujimori government had much at stake in the October 1993 referendum and the April 1995 presidential election. The referendum on the new constitution was widely seen as a referendum on three years of Fujimori government (Roberts and Arce 1998, 229). Moreover, the new constitution included a clause that would allow Fujimori to run for reelection, which he could not do under the 1980 constitution. The April

⁹ Moncada (1996) presents a simple timeline of quarterly FON-CODES expenditures and elections between 1991 and 1995. Interpretation of Moncada's graph is not easy, however, because elections do not always fall at the end of a quarter. Also, Moncada does not formally test the relationship between elections and expenditures, perhaps because of the small number of quarters (sixteen) and the large number of national elections (three) during the period.

¹⁰ Because of the two-week lag between approval of a project and disbursement of funds, the relevant month for the parameter Elec, in equation 2 is taken to be that in which the project was approved, if the election took place in the second half of the month, or the month preceding it, if the election took place in the first half of the month. Note that this is equivalent to shifting all approved expenditures forward by two weeks.

	Community-Based Projects		Specia	Special Projects		Total Expenditures	
	(1)	(2)	(3)	(4)	(5)	(6)	
Election	7.05* (3.48)	_	5.07* (2.12)	_	12.72** (4.58)	_	
Election 1	_	6.08 (5.32)	→ `	0.82 (2.28)		3.73 (6.52)

Number of observations	42	42	42	42	42	42	

Note Standard errors corrected for sensi correlation using the Coohrane-Oroutt procedure are reported in parentheses. There are four sessional duminuses one for each quarter of the calendar year. A constant was calculated but is not reported p < 0.05, p < 0.05, p < 0.05, p < 0.05.

1995 election would assure Fujimori five more years as president. By contrast, the November 1992 election to the constituent assembly took place at a time when the government was virtually unchallenged: The opposition was in disarray after Fujimori's "self-coup" of April 1992, and the president's popularity was very high. Indeed, three of the four "historical" parties— Popular Action, APRA, and the United Left—did not even participate in the 1992 election, alleging that this would "legitimize" Fujimori's coup. The Popular Christian Party participated but won only 9.8% of the vote. Fujimori's Cambio 90-Nueva Mayoría party won 49.2% of the vote and 44 of the 80 seats in the constituent assembly. The remaining 41% of the vote went to smaller parties, many of which were formed shortly before the election.

The empirical analysis above suggests that Fujimori boosted FONCODES expenditures when it mattered most, but other factors are obviously at work. Consider, for example, the expenditure spike in September 1994 (month = 35), the second largest in the data set. In August 1994, Manuel Vara Ochoa replaced Manuel Estela as the executive director of FONCODES. Estela was a technocrat who was highly regarded at the World Bank and the Inter-American Development Bank. Before assuming the post at FONCODES, he had been the head of SUNAT, the government agency charged with the collection of taxes in Peru. Estela brought to FONCODES his advisors from SUNAT and a working method that emphasized a rigorous screening of project proposals. This was not to Fujimori's liking, and the president quickly became dissatisfied with Estela's unwillingness to meet "disbursement targets." By contrast, Vara Ochoa was a friend of Fujimori's from their days as professors at the Agrarian University in Lima, and he was understood to be more sensitive to the political importance of a speedy approval process. The massive spike in expenditures in September 1994 may be a result of the wholesale approval of projects that had not been funded under Estela.

THE GEOGRAPHIC DISTRIBUTION OF FONCODES EXPENDITURES

To determine the influence of elections on the geographic distribution of FONCODES expenditures for community-based projects, I test a model in which *past* electoral outcomes are used to predict *future* expenditures.¹² I start by describing some features peculiar to

¹¹ Anthor's conversations with staff at FONCODES and at the Ministry of the Presidency. One knowledgeable staff member described the relationship between Estela and Pujimori as "strained" and related a telephone conversation in which Fujimori gave Estela a serious warning ("un toque de atención de palacio").

¹² Arguably, voters base their decisions on the promises made by an incumbent and his challenger(s) before an election, and this is the starting point for much theoretical work on the subject (Cox and McCubbins 1986; Dixit and Londregan 1996; Lindbeck and Weibull 1987). Promises can be just that, however, and voters are likely to take the "revealed preferences" of incumbents, evidenced by their behavior in office, as a more reliable indication of the policies they intend to follow in the future. The issue of the (lack of) credibility of promises is particularly relevant in Peru. Pujimori was elected in 1990 on a platform that opposed economic shock therapy, yet he implemented one of the most radical orthodox programs to stabilize and restructure the economy within weeks of taking office (Roberts

TABLE 2. Socioeconomic Characteristics, Voting Patterns, and FONCODES Per-Capita Expenditures on Community-Based Projects, by Province

	Mean	St. Dev.	Median	25th %	75th %	Mln.	Max.

Source: Information on the FONCODES poverty index and per-capita expenditures was made available by FONCODES. Information on population and the proportion rural is based on the 1993 Census and is available from INEL information on the pro-Fujimon vote in 1990 and 1993 is found in Tuesta Soldevilla 1994.

the Peruvian setting, discuss the econometric specification, and present results.

Two-Tier Elections, Taxes, and Transfers in Peru

At least two features of elections and expenditures need to be discussed in the context of a model of political influences on the geographic distribution of social expenditures in Peru: the two-tiered structure of presidential elections and the geographic incidence of the taxes, if any, that must be raised to finance expenditures.

Presidential elections in Peru are often decided in two stages. If no candidate receives a simple majority in the first round of the election, a run-off is held between the two candidates with the largest number of votes. In the 1990 election, Vargas Llosa led by a small margin after the first round of voting on April 8 (32.6% to Fujimori's 29.1%), but he lost by a large margin in the second round on June 10 (37.6% to Fujimori's 62.4%). Fujimori was a virtual unknown in many areas of the country until shortly before the first round (Carrión 1996; Schmidt 1996; Stokes 1996b), but he had become a household name two months later. Because voters in Peru were arguably constrained by lack of information in the first round, I use the results of the run-off for all estimations below.

Transfer programs like FONCODES are generally paid for out of tax revenues. Since taxes have a geographic incidence pattern that can affect electoral outcomes, one must consider the distribution of "net transfers," or the per-capita difference between transfers and taxes needed to finance a program.

FONCODES was initially financed out of general

and Arce 1998; Stokes 1996b). For this reason, I take Fujimori's record in office to be a more credible indication of his intended policies than any campaign promises.

government revenues. In early 1994, however, the Peruvian government appealed to the World Bank and the Inter-American Development Bank for funding, and two loans for \$100 million and \$94 million (U.S. dollars), respectively, were made available for FON-CODES.¹³ These loans included provisions for a fiveyear grace period and full amortization over seventeen years—presumably, well after Fujimori would have left office. Theory suggests that fully rational voters should take into account the net present value of the expected taxes that must be raised in the future to repay loans. In practice, however, short time horizons, lack of information, and the real or imagined possibility of debt renegotiation or default could limit the extent to which voters in Peru considered these future costs. This article only considers FONCODES expenditures.

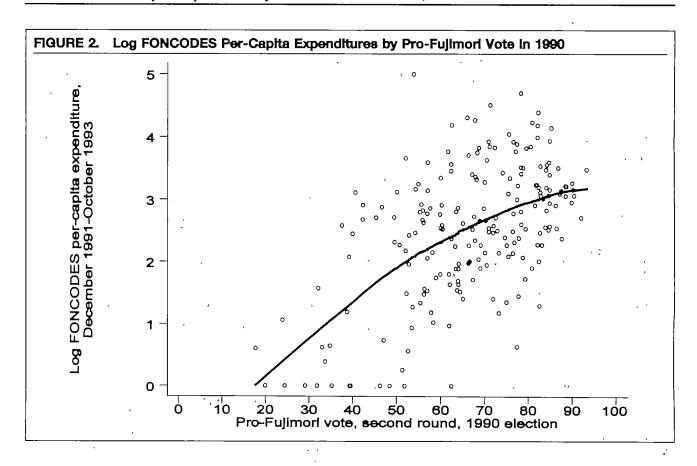

Table 2 provides descriptive statistics of socioeconomic characteristics of provinces, voting patterns, and per-capita expenditures made by FONCODES. It shows that provinces in Peru vary a great deal on all these counts. The variation in per-capita FONCODES expenditures is particularly noteworthy: Some prov-

[&]quot;This is the poverty index used by FONCODES in 1996. It is a weighted mean of eight variables: the rate of chronic matinization among schoolchildren, the rate of filteracy, the proportion of children not in school, and the proportion of households who live in overcrowded housing, have inadequate roofing, no access to running water, no sewerage, and no electricity. Higher values of the index are an indication of higher poverty. All values are normalized so that the province with the lowest amount of poverty has a value of the FONCODES poverty index equal to 1.

^bSummary statistics for the pro-Fujimon vote in 1990 and 1993 are population weighted. They do not correspond exactly to the actual fractions voting for Fujimori because of differences between total population and the population of eligible voters. Moreover, electoral data for the second round of the 1990 presidential election are only available for 205 of the 224 provinces that exacted at the time.

This refers to per-capita expenditures made by FONCODES on community-based projects between December 1991 and March 1996, in 1992 soles.

¹³ Determining the exact moment at which foreign funding became available is not straightforward. The World Bank loan, for example, was approved in December 1993 and became effective in March 1994; disbursement agamst it began in May 1994. But the loan included a proviso that up to \$10 million (U.S. dollars) could be used to fund eligible community-based projects approved since August 1, 1993. There is also controversy about the extent to which multilateral organizations such as the World Bank, the Inter-American Development Bank, and the International Monetary Fund (IMF) attempted to convince Fujimori of the importance of programs targeted at the poor or went along with his own initiatives only reluctantly. Although the IMF and the banks had some initial concerns about FONCODES (Graham 1994; Kay 1996, Weyland 1998), the fact that it was very similar to other programs funded by the World Bank and the Inter-American Development Bank throughout Latin America meant that loans for FONCODES could be justified because of their likely effect on the poor.

inces received no transfers whatsoever, while others received more than six times the mean.

Figures 2 and 3 show scatter diagrams and nonparametric (kernel) regressions of the logarithm of percapita FONCODES expenditures as a function of the proportions voting for Fujimori in the 1990 presidential election and the 1993 referendum, respectively. Figure 2 reveals a positive correlation between the 1990 Fujimori vote and expenditures between December 1991 and October 1993; Figure 3 shows a negative correlation between the 1993 Fujimori vote and expenditures in the November 1993—March 1995 period. In both instances, there appears to be some curvature in the relationship between the vote and expenditures.

Figures 2 and 3 provide some prima facie evidence that the distribution of FONCODES expenditures between 1991 and 1995 may have been responsive to electoral influences and that the 1993 referendum was a turning point for FONCODES. This has been argued elsewhere (Graham and Kane 1998; Kay 1996; Roberts and Arce 1998), but much of the earlier work has some

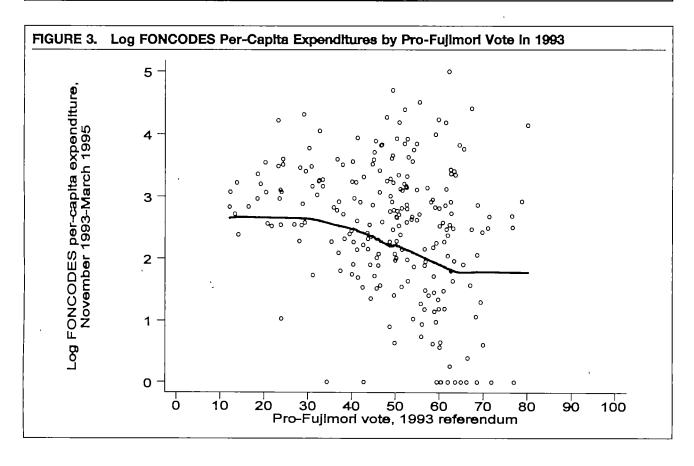

important limitations. First, it frequently does not use a multivariate regression framework to separate political from other effects. To see why this may seriously bias the results, consider expenditure patterns after 1993. FONCODES spent more on poor provinces before and after the 1993 referendum, and these poor provinces largely voted against the government in 1993. Were the expenditures made by FONCODES after October 1993 motivated by electoral considerations, redistributive considerations, or both? Multivariate regression analysis allows for a parsing out of the "political" and "poverty" influences on the distribution of FONCODES funds.

Second, previous studies generally test for a linear effect of the last election on the distribution of expenditures (Graham and Kane 1998). This approach does not allow for nonlinearities, which are at the heart of the marginal voter models, or the dynamic changes inherent in models that take into account more than one election.¹⁵

Third, earlier work uses the larger department-level (rather than province- or district-level) information on the distribution of FONCODES expenditures and the vote in various elections. This seriously diminishes the sample size and makes it difficult to run meaningful

 $^{^{14}}$ Nonparametric regression analysis can be thought of as a moving average. The expectation of Y (in this case, the log of per-capita FONCODES expenditures) is estimated conditional on X (the progovernment vote in the 1990 election or the 1993 referendum) without imposing any assumptions about functional form. It is therefore a much more flexible and accurate way to represent bivariate associations than, say, ordinary least squares (OLS). For an excellent introduction to nonparametric regressions see Deaton 1997, 190–203, as well as Silverman 1986 and Hardle 1991. To avoid dropping provinces that received zero transfers, I added 1 to per-capita expenditures in every province before taking logs (see Maddala 1983, 181, for a similar ad hoc correction).

¹⁵ This is a shortcoming in much of the empirical literature on political influences on expenditure patterns. Wright's (1974) analysis of geographic patterns in the distribution of discretionary funds during the New Deal is one early and important exception. More recently, Case (1997) finds evidence that expenditure patterns in Albania conform to the predictions made in the Lindbeck-Weibull (1987) model

regressions. Even more important, in Peru there are often very large differences in the vote within departments. In the department of Amazonas, for example, only 23.2% of the population in the province of Condorcanqui but 60.0% of the population in neighboring Bongara voted for the government in 1993. More formally, the total variance in the distribution of the progovernment vote can be decomposed into interand intradepartment components (e.g., Cowell 1995). Such a decomposition shows that less than half the total variation across provinces in the vote in the 1990 election and the 1993 referendum (43.0% and 46.8%, respectively) is accounted for by differences across departments. Since all this information was published by province, it is hard to believe that the government would deliberately choose not to make use of it.

Finally, the results presented by Graham and Kane (1998) and others do not acknowledge that estimates of the influence of elections on FONCODES expenditures after 1993 may be contaminated by simultaneity bias. I now turn to this issue.

Econometric Specification

Formally estimating the (possible) effect of elections on expenditures presents a number of econometric complications. Simultaneity bias is perhaps the most obvious. Consider the following equation.

$$\operatorname{Exp}_{pr} = \alpha + \beta \operatorname{Elec}_{pr-1} + 8z1_{pr} + \varepsilon_{pr}, \qquad (3)$$

where Exp_{pt} is per-capita expenditures in province p at time t, $\operatorname{Elec}_{pt-1}$ is the outcome of an election in

province p in the previous period t-1, $z1_{pt}$ is a vector of other variables that affect the distribution of expenditures, and ε_{pt} is the error term. If the error term is autocorrelated over time, it could be rewritten as:

$$\varepsilon_{pt} = \rho \varepsilon_{pt-1} + \nu_{pt}, \tag{4}$$

where ρ is the autocorrelation coefficient. Equation 3 then becomes:

$$\operatorname{Exp}_{pi} = \alpha + \beta \operatorname{Elec}_{pi-1} + \delta z 1_{pi} + \rho \varepsilon_{pi-1} + \nu_{pi}.$$
(5)

Politicians attempt to manipulate expenditures because they believe that these have an effect on elections:

$$Elec_{pt} = \chi + \gamma \ Exp_{pt} + \eta z 2_{pt} + w_{pt}, \qquad (6)$$

where $z2_{pt}$ is a vector of other variables that affect election outcomes, and w_{pt} is the error term. If both equations 5 and 6 hold, then it can easily be shown that estimating the parameter β by OLS will produce results that are biased and inconsistent (e.g., Deaton 1997, 97-8). The intuition is that electoral outcomes are "contaminated" by expenditures in the previous period(s).

Bias is induced when both conditions—serial correlation in the error term and an effect of expenditures on elections—are met. In practice, there is often good reason to suspect that the error term ε_{pi} is positively autocorrelated over time. Demand-driven programs like FONCODES probably involve a cumulative acquisition of skills and knowledge by potential beneficia-

ries: It takes time to understand what kinds of projects are eligible for funding, practice to prepare a good proposal, and time to develop contacts with the social fund staff who are ultimately responsible for review of the application. If there is such a learning curve, then communities that prepare a successful proposal once should find it easier to do so again, whereas those who are turned down may decide that applying for funding is not worth the effort. In terms of equation 5, positive and negative shocks to the error term in one period are likely to be carried forward into the next period. Meanwhile, the presumption that social expenditures affect electoral outcomes seems reasonable. Since there may well be serial correlation and an effect of expenditures on elections, studies that disregard the possibility of simultaneity (e.g., Bruhn 1998; Graham and Kane 1998) must be treated with caution.16

The standard solution to this simultaneity problem is instrumental variables, but the search for appropriate instruments is not simple. Variables that affect elections tend to affect expenditures as well. The Peruvian case offers a partial solution, however, because we may legitimately be able to treat the 1990 election as exogenous to the model. Because FONCODES did not fund any projects until more than a year after the 1990 election, that election cannot have been affected by FONCODES expenditures, equation 6 does not apply, and simultaneity should not be a source of bias in the parameters estimated in equation 3 for the December 1991-October 1993 period. Therefore, the break in FONCODES expenditures before December 1991 may work as a "natural experiment" that allows us to identify the effect of an election on expenditures (a general discussion of these issues can be found in Angrist and Krueger 1999; Deaton 1997, 112-5). More generally, this result highlights the value of research that focuses on new social programs to estimate the effect of elections on public expenditure patterns.¹⁷ Estimates of the effect of elections on expenditures after October 1993 are more open to question because the 1993 referendum may itself have been determined in part by FONCODES expenditures in the preceding period.

Lack of comprehensive data and censoring are both potential sources of bias. Information on the results of the 1990 presidential run-off is not available for 19 provinces. Also, seven new provinces were created

between 1990 and 1995. As a result, we have data on FONCODES expenditures for 231 provinces but data on elections for only 205 provinces.

There is nothing distinctive about the provinces for which electoral data are missing—they are not, for example, particularly poor or rich, or concentrated in one part of the country. As a safeguard, however, I ran additional regressions in which the missing values were replaced with the relevant departmental averages. ¹⁸ The results (not reported) are very similar to those which do not include these provinces, which suggests that this is not a source of bias.

FONCODES financed no community-based projects in twelve provinces between December 1991 and October 1993 and in another twelve provinces between November 1993 and March 1995 (six of the provinces overlap). Censoring of this sort can make OLS estimates biased and inconsistent. Tobit regressions are routinely used as a solution to this problem, but Tobit estimates will also be biased and inconsistent if, as is often the case, the distribution of the error term is heteroskedastic. An alternative estimator, Powell's censored least absolute deviations (CLAD) estimator, is unbiased and consistent but requires large amounts of data (see Deaton 1997, 85-90, for an excellent introduction to these issues). In practice, the bias induced by censoring in the regressions in this article is likely to be small because censoring affects less than 6% of the sample. I therefore present OLS estimates and note when the Tobit or Powell estimators produce noticeably different results.

Estimates of Political Effects: 1991-93

Table 3 presents estimates of the effect of various parameters on the logarithm of per-capita FON-CODES expenditures between December 1991 and October 1993. Column 1 reports the result of an OLS regression on three parameters of interest only: the measures of marginality, core support, and initial consumption (Cox and McCubbins 1986; Dixit and Londregan 1996; Lindbeck and Weibull 1987). "Nonmarginality" is proxied by the absolute deviation of the vote from 50% (as in Case 1997) and core support by the vote for Fujimori¹⁹; income is proxied by the composite poverty index developed by FONCODES in 1996.²⁰

¹⁶ A similar problem can obviously bias the results in regressions of observed electoral outcomes on expenditures (e.g., Weyland 1998), if the distribution of these expenditures was itself politically motivated. ¹⁷ Unless, of course, the new program was promised before an election, the promise was regarded as credible, and it influenced the outcome of the election (Avinash Dixit, personal communication with the author, April 1998). Fujimori committed himself to not implementing the kind of shock program advocated by Mario Vargas Llosa, a commitment he quickly broke after the election. His platform also made references to continued subsidies for basic consumer goods and to the promotion of small domestic industries. (I thank an anonymous referee for this information) The results for the 1991-93 period will only be contaminated by simultaneity bias, however, if Fujimori's campaign promises were credible and specific enough to enable voters in different provinces to predict differences in the transfers they could expect to receive from a program such as FONCODES (which was never mentioned in the campaign).

¹⁸ For example, there are no electoral results for the seven provinces in the department of Apurímac, but we know that 81.54% of the population of the department voted for Fujimori. These regressions, therefore, would assume that the pro-Fujimori vote in each of the seven provinces was 81.54%.

¹⁹ Alternatively, core supporters could be approximated by the vote for Fujimon in the first round and swing voters by the additional vote for Fujimori in the second round (Chang Tai-Haieh, personal communication with the author, September 1998). A disadvantage of this procedure in the Peruvian context is that it would further limit the sample size, as the results of the first round are available only for 180 of the 224 provinces that existed at the time.

²⁰ FONCODES has made adjustments to the index in virtually every year—dropping some individual indicators, adding new ones, and changing the weights given to each. The indices used before 1996 were disaggregated at the province level only. Since I disaggregated the province of metropolitan Lima into its individual districts, only the 1996 index could be used for the analysis. Because most of the

TABLE 3. The Effect of the Second-Round 1990 Presidential Election on the Distribution of Per-Capita FONCODES Expenditures for Community-Based Projects, December 1991– October 1993

	(1)	(2)	(3)

F-test	9.61***	11.85***	2.34
R ²	0.434	0.445	0.781
Number of observations	205	205	205

Note. Standard errors corrected for heteroekedasticity are reported in parentheses. An F-test for joint eignificance of both political variables is also reported. A constant was calculated but not reported. Additional controls: A Fourier sense expansion of the FONCODES poverty index; province-level averages for the age of the household head; the average number of years of schooling of household members, the occupation of all adults in the household; separate variables for the proportion of households who own a car, a refrigerator, color TV, and black-and-white TV; the proportion of the population that is indigenous (defined as those whose mother tongue is a language other than Spanish); the infant mortality rate; a dummy variable for border provinces; and 25 departmental dummies $^*p < .06$, $^{**p} < .01$, $^{***p} < .001$.

Note that one cannot test a dynamic model for 1991–93 because Fujimori was first elected in 1990. Moreover, given the dramatic changes in the Peruvian political landscape in the early 1990s and the fact that Fujimori was not the candidate of an established party, he could not reasonably hope to extract information from presidential elections held before 1990.

If variables are omitted from the model, and if these variables are correlated with the measures of marginality, core support, or the FONCODES poverty index, then the coefficients on these parameters will be biased and inconsistent in the usual way. I address this problem by including a large number of controls. The OLS regression for column 2 in Table 3 includes parameters for the (log of the) population of a province and the proportion rural. The large *t*-statistic on the FONCODES poverty index in columns 1 and 2 suggests that

individual indicators tend to be highly correlated with one another, however, the choice of index is unlikely to have an important effect on the results. The results in tables 3 and 5 are robust to alternative measures of income, such as the province-level estimates of imputed income and imputed proportion below the poverty line developed by INEI. (An explanation of these and other district-level welfare measures can be found in Schady 1999.)

it is important for the relationship between expenditures and the index to be specified correctly. To account for possible nonlinearities in this relationship. I include a Fourier series expansion of the FON-CODES poverty index in column 3.21 In addition, this regression includes numerous socioeconomic controls listed at the foot of the table and a dummy variable for border provinces. This border dummy is included as a control because FONCODES may have spent differently in areas near the volatile Ecuadorian border.22 Finally, the specification in column 3 includes 25 department-level dummies. Regional offices of FON-CODES generally correspond to departments, and these dummies are meant to capture differences in institutional capacity across offices as well as any other possible department-level differences.

The results in Table 3 show that marginal voters, core supporters, and the poor all received a disproportionately large share of FONCODES expenditures. The coefficient on the measure of nonmarginality is always negative and is significant at the 5% level when all the controls are added; the coefficient on the measure of core support is positive and significant at the 5% level in every specification.²³ Note that this is a very strong result indeed: The political variables are significant even after dozens of controls, including sophisticated nonlinear measures of the poverty of a province, are incorporated into the model. Finally, the coefficient on the FONCODES poverty index is positive and significant at the 1% level, which shows that FONCODES spent significantly more on the poor. The sign on the coefficients when the parameters are estimated with Tobit or Powell's CLAD is the same, and the magnitude of the effects of the political variables and the FONCODES poverty index tends to be larger

²¹ The Fourier series expansion includes terms for the log of the FONCODES poverty index, its square, the sine of the log of the index and the sine of twice the log of the index, and the cosine of the log of the index and the cosine of twice the log of the index. As usual, the logarithm of the FONCODES poverty index had to be rescaled to prevent values smaller than $-\pi$ or larger than π . The coefficient on the FONCODES poverty index is not reported in column 3 of Table 3, or in columns 3 and 6 of Table 5, because it is meaningless on its own when the square, sine, and cosine parameters are included in the regression.

²² A 150-year-old border dispute between Ecuador and Peru simmered throughout the early 1990s and broke out into open warfare in early 1995. Much of the area along the border is extremely remote jungle, mainly inhabited by indigenous people, with little connection to the formal Peruvian (or Ecuadorean) economy. There are anecdotal accounts which suggest that state institutions, including FON-CODES, were pressured to "develop" these border provinces. In none of the estimations in this article, however, did the border dummy variable, or a separate dummy only for provinces along the Peru-Ecuador border, have a significant positive coefficient. A permanent peace agreement between the two countries was signed in Brasilia on October 26, 1998.

²³ If politicians maximize the probability of being reelected, rather than the expected number of votes, then the positive coefficient on the pro-Fujimori vote could also be a measure of the "partisan reward" for the supporters of the stronger party predicted in the modified Lindbeck-Weibull model (Case 1997; Lindbeck and Weibull 1987). More generally, there is no obvious way to disentangle the effect of core support from that of partisan reward when the incumbent is also the stronger of the two parties (Mark Thomas, personal communication with the author, March 1998).

TABLE 4. The Magnitude of Political and Poverty Effects on the Distribution of Per-Capita FONCODES Expenditures for Community-Based Projects, December 1991– October 1993

	(1)	(2)	(3)
1990 election: Percentage vote for Fujimori	43.29	54.83	44.88
1990 election: absolute value (% for Fujimorl- 50%)	-2.65	-12.54	-39.67
Log (FONCODES poverty Index)	56.08	33.86	

Note: Each cell reports the effect of a change of one standard deviation in the variable in question on the distribution of per-capita FONCODES expenditures for community-based projects. Columns 1, 2, and 3 correspond to columns 1, 2, and 3 in Table 3.

than the corresponding OLS estimates. The only important difference is that the CLAD estimates produce larger standard errors, so that the political coefficients are no longer significant when all the controls are included.

How large are these estimated effects? Table 4 reports the predicted effect of a change of one standard deviation in core support, marginality, and the (log of the) FONCODES poverty index on per-capita FONCODES expenditures. Column 2, which corresponds to column 2 in Table 3, shows that, ceteris paribus, an increase of one standard deviation in the vote for Fujimori resulted in a 55% increase in per-capita expenditures, whereas a similar increase in marginality resulted in a 13% increase in per-capita expenditures. Increases in poverty also have a large influence on expenditures: An increase of one standard deviation in the (log of the) FONCODES poverty index resulted in a 34% increase in per-capita expenditures.

Table 4 suggests that the effect of the two political variables is large indeed, especially as the number of controls increases. But interpretation of the magnitude of the political effects is not straightforward because marginality and core support work against each other at levels of support for Fujimori above 50%. For instance, a province in which 75% of the population voted for Fujimori could expect to receive large or small per-capita transfers, depending on whether the effect of core support or marginality is more important. To clarify this matter, Figure 4 graphs predicted expenditures at various levels of support for Fujimori for each of the specifications in Table 3. Other variables in the regressions are kept constant at their means.²⁴ Note that Figure 4 therefore summarizes both the core supporter and marginal voter effects. If only core supporters affect the distribution of expenditures, then the predicted per-capita expenditure schedule should be smooth, with no kink at the 50% point. Conversely, if only marginal voters affect the distribution of expenditures, then the line should be perfectly symmetrical above and below the 50% kink. Figure 4 shows that the estimated influence of core support is much larger than that of marginality when only the two political variables and the FONCODES poverty index are included in the regression (specification 1), but the effect of marginality increases noticeably with the number of controls (specification 3).

Estimates of Political Effects: 1993-95

The Peruvian political landscape changed dramatically between 1990 and 1993. In the 1993 referendum, Fujimori generally did well in wealthier urban areas, especially Lima, but he lost the support of large segments of lower class and rural voters who had brought him into office in 1990 (Roberts and Arce 1998; Stokes 1996b). What effect did these massive shifts in Fujimori's constituency have on the distribution of FONCODES expenditures?

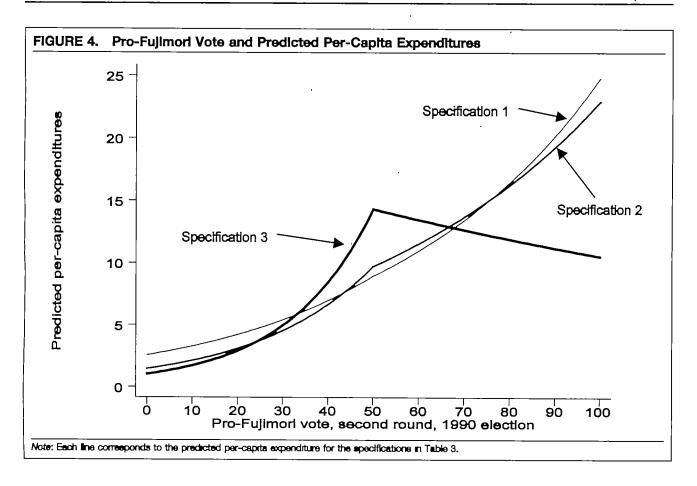

Table 5 reports results from a set of regressions of per-capita FONCODES expenditures between November 1993 and March 1995 on the 1993 referendum. Columns 1 through 3 are based on regressions of expenditures on measures of core support and nonmarginality from the referendum. These specifications therefore test a model similar to that found so important for the 1991-93 distribution of FONCODES expenditures, updated with the results of the 1993 referendum. Columns 4 through 6 are based on regressions of expenditures on the change in the pro-Fujimori vote.25 If Fujimori were trying to buy back the vote in errant provinces, then the coefficient on the change in the vote would be negative; conversely, if Fujimori were attempting to consolidate his power base in provinces with new-found supporters, then the coefficient would be positive.26

The results in Table 5 should be interpreted with caution. As I argue above, if FONCODES expenditures between December 1991 and October 1993 affected the outcome of the 1993 referendum, then any regression of expenditures after October 1993 that includes the results of the referendum as an explanatory variable is likely to be contaminated by simultaneity bias. Yet, with this caveat in mind, the results in Table 5 suggest that *changes* in the vote between 1993 and 1990, rather than simply the level of government

²⁴ Mechanically, this can be done by multiplying the coefficient on nonpolitical parameters in the regression by the mean value for the parameter in question and then adding them to the constant in the regression. The coefficients on the measures of core support and nonmarginality are then used to predict expenditures at every level of the vote between 0 and 100%.

²⁵ "Change" is defined as the 1993 pro-Fujimori vote minus the 1990 pro-Fujimori vote, divided by the pro-Fujimori vote in 1990. Dividing through by the results of the 1990 presidential election recognizes that, say, a 5% reduction in the pro-Fujimori vote is unlikely to mean the same thing in a province in which 70% of the population voted for Fujimori in 1990 as in one in which the level of support in 1990 was only 20%.

²⁶ One shortcoming of an approach that focuses on changes in the vote is the fact that the 1990 presidential election and the 1993 referendum were different in character. In the referendum, voters could "safely" express opposition to part of Fujimori's program without having to choose an alternative (Graham and Kane 1998, 82, Roberts and Arce 1998, 229).

support in the 1993 referendum, influenced the distribution of FONCODES expenditures after 1993. The coefficients on the measures of marginal vote and core support are jointly insignificant at the 5% level in all the specifications. By contrast, the coefficient on the change in the pro-Fujimori vote is negative and significant at the 1% level or more in two of the three specifications in Table 5. Roberts and Arce (1998) argue that Fujimori attempted to "recapture the loyalty of the popular sectors" by picking up the pace of poverty-alleviation programs after 1993. The results in Table 5 suggest that social expenditures channeled through FONCODES were used for such a buy-back strategy in a very focused way: FONCODES projects were specifically directed at provinces that supported Fujimori in 1990 but abandoned him in 1993.

Table 5 shows that poverty continued to be an important determinant of per-capita expenditures: The coefficient on the (log of the) FONCODES poverty index is positive, large, and highly significant in all specifications. Rurality is also associated with significantly higher per-capita expenditures (columns 2 and 5).²⁷ This finding does not conform with the extensive literature in the political economy of development that argues that vocal and organized urban constituencies in LDCs siphon off the bulk of public funds (Bates 1981;

Graham 1997; Nelson 1992). FONCODES expenditures between November 1993 and March 1995 favored rural areas, perhaps because other social programs in Peru at the time were directed at urban populations.²⁸

What, finally, can we say about the magnitude of these effects? Table 6 summarizes the effect of a change of one standard deviation in the log of the FONCODES poverty index and the measure of the change in pro-Fujimori support on the distribution of per-capita FONCODES expenditures. The results suggest that the political influence on the distribution of FONCODES expenditures continued to be large: A decrease of one standard deviation in the pro-Fujimori vote resulted in an increase of between 16% and 34% in per-capita expenditures. The effect of poverty on the FONCODES expenditures appears to have increased after the referendum. This result is consistent with other work (Paxson and Schady 1999), which shows that the targeting of FONCODES investments to the poor improved over time.29

²⁷ Interpretation of the coefficients on the proportion rural and population size in columns 3 and 6 of Table 5 is not straightforward because of the high degree of colinearity between these variables and all the additional controls. The same caveat obviously applies to column 3 in Table 3 as well.

²⁸ These included two housing programs (ENACE, Banco de Materiales); a program for the construction of electricity, water, and santtation systems (UTE-FONAVI); a small welfare program for destitute families (INABIF); and a school construction program that spent mamly in urban areas (INFES) (see World Bank 1996).

²⁶ Parson and Schady (1999) present nonparametric regressions for FONCODES expenditures on education projects as a function of mean district per-capita meome, by year. The regressions show that the geographic targeting of FONCODES projects clearly improved between 1992 and 1995.

Note: Standard errors corrected for heteroekedastrorty are reported in perentheses. An F-test for joint significance of both political variables from the 1993 referendum is also reported. A constant was calculated but not reported. For a list of additional controls, see note to Table 3. *p < 05, **p < 01, ***p < 001, ***p < 001.

CONCLUSION

Much theoretical and empirical work on public expenditure patterns in democratic regimes argues that politicians manipulate the timing, composition, and geographic distribution of expenditures to maximize the likelihood of remaining in office. Increases in public expenditures are timed to coincide with upcoming elections; budgetary trade-offs are made to satisfy important constituencies; and expenditures are directed toward areas of the country that are considered critical for an incumbent's reelection bid.

The bulk of studies on political influences on expenditures in LDCs and elsewhere has focused on aggregate macroeconomic variables (e.g., Ames 1987; Remmer 1993). This literature has shown that politicians frequently manipulate aggregate demand and large-scale subsidy or universalist social programs to suit

their electoral ambitions. Such manipulation may now be less feasible, however. An increasingly global environment makes countries more vulnerable to sudden losses of investor confidence and capital flight (e.g., Rodrik 1999), and the costs of blatant political interference in the macroeconomy may be prohibitive. At the same time, many universalist social programs have ceased to exist or have been cut along with public sector budgets. Understanding how politicians, in Peru and elsewhere, attempt to manipulate small-scale, targeted poverty-alleviation programs is particularly timely.

This article uses formal econometric modeling and a rich, highly disaggregated data set to analyze the effect of elections on the timing and distribution of expenditures made by the Peruvian Social Fund between 1991 and 1995. An important advantage of this approach is that it allows the political and poverty influences on FONCODES expenditures to be parsed out. I argue that there is a large, significant effect of elections on the timing and distribution of FONCODES expenditures. These were boosted before national elections, and community-based projects were channeled to provinces where the political returns were expected to be large. Moreover, the Fujimori administration altered its expenditure patterns to take into account the worsethan-expected government performance in the 1993 referendum.

The results of this study show that FONCODES has clearly been responsive to political imperatives. Indeed, it was arguably very well suited for President Fujimori's electoral ambitions. Unlike most programs

conducted by the line ministries in Peru, FONCODES expenditures are truly discretionary. Since 1993, FONCODES has had a backlog of thousands of proposals that could be funded at opportune times in provinces deemed electorally important. Polls suggest that FONCODES projects are closely identified with the presidency and with Fujimori himself (Moncada 1996, 62).

But FONCODES also appears to have had an important redistributive function. My results show that funds flowed disproportionately to poor provinces. Household survey data indicate that the infrastructure constructed by FONCODES reaches a larger fraction of households, especially poor ones, than other programs in the Ministry of the Presidency (Paxson and Schady 1999; World Bank 1999). Such success in reaching the poor can in part be explained by the fact that FONCODES is free of many of the restrictions, much of the paperwork, and many of the inefficiencies that have given the public sector in Latin America a bad name.

Was FONCODES an effective poverty-alleviation program or a brazen attempt to buy votes? There is no simple answer because decisions about funding apparently were made on the basis of both political and poverty criteria. Ironically, it is precisely those features that enabled FONCODES to reach the poor—such as a high degree of flexibility in the allocation, timing, and composition of expenditures—which made it particularly vulnerable to political interference. This tension between effective redistribution and pork barreling need be no coincidence: Nelson (1992) argues that programs for the poor are much more likely to be implemented when the executive keeps control over patronage.

The government of President Alberto Fujimori has privatized state-owned enterprises, liberalized markets, and slashed subsidies and tariffs in Peru. Fujimori has thus eliminated many of the tools traditionally used by incumbents to enlist the support of important constituencies before an election (Grindle 1996; Herbst 1990). Of course, low inflation and high rates of economic growth also bring important returns at the polls, returns that may far exceed those from the more interventionist policies of yore (Nelson 1992; Przeworski 1993; Stokes 1996a). This article shows, however, that old populist habits die hard.

Free to Trade: Democracies, Autocracies, and International Trade

EDWARD D. MANSFIELD Ohio State University

HELEN V. MILNER Columbia University

B. PETER ROSENDORFF Georgetown University and University of Southern California

Relatively little research has focused on whether countries' political institutions affect their international trade relations. We address this issue by analyzing the relationship between regime type and trade policy. In a formal model of commercial policy, we establish that the ratification responsibility of the legislature in democratic states leads pairs of democracies to set trade barriers at a lower level than mixed country-pairs (composed of an autocracy and a democracy). We test this hypothesis by analyzing the effects of regime type on trade during the period from 1960 to 1990. The results of this analysis accora with our argument: Democratic pairs have had much more open trade relations than mixed pairs.

The effects of domestic political institutions on trade policy have long been a source of controversy among social scientists. Despite the widespread interest that this debate has prompted, however, remarkably few studies have addressed the links between political regime type and commercial policy.1 Most work on the political economy of trade policy that examines institutional factors focuses only on variations in policy among democracies and avoids comparing democracies with other types of regimes. Moreover, many analyses of trade barriers—especially those by economists—ignore the effects of domestic political institutions. In light of the recent interest expressed in how regime type influences various aspects of foreign policy (e.g., Doyle 1986; Farber and Gowa 1995; Russett 1993; Siverson and Emmons 1991), a systematic analysis of the links between regime type and trade policy seems long overdue.

Here, we examine whether groups of democracies are better able to liberalize trade than are groups of autocracies or groups comprised of both democracies and autocracies. By providing one of the first assess-

Edward D Mansfield is Associate Professor of Political Science, Ohio State University, Columbus, OH 43210 (mansfield@poliscl. sts.ohio-state.edu). Helen V. Milner is Professor of Political Science, Columbia University, New York, NY 10027 (hvm1@columbia.edu). B. Peter Rosendorff is Associate Professor in the School of International Relations, University of Southern California, Los Angeles, CA 90089, and in the Department of Economics and the School of Foreign Service, Georgetown University, Washington, DC 20057 (bpeter@usc.edu).

Earlier versions of this paper were presented at the 1997 annual meeting of the American Political Science Association, Washington, DC, and at seminars at the University of Chicago (PIPES), Georgetown University, Stanford University, the University of Southern California, and Yale University. We are grateful to participants in these seminars, to David Baldwin, Marc Busch, James Fearon, Jeffry Frieden, Joanne Gowa, Dean Lacy, David Lake, Charles Lipson, John McLaren, John Odell, Robert Pahre, Mohan Penubarti, Ronald Rogowski, Seth Sanders, and Duncan Saldal for helpful comments, and to Joe McGarvey and Jon C. Pevehouse for research assistance. In conducting this research, Mansfield was assisted by a grant from the Ohio State University Office of Research and by the Hoover Institution at Stanford University, where he was a National Fellow during 1998-99. Rosendorff was assisted by a grant from the James H. Zumberge Faculty Research and Innovation Fund at the University of Southern California.

ments of whether patterns of commercial protection depend on regime type, we help shed light on whether there is a "democratic difference" in foreign economic policy. Our study also should contribute to a broader understanding of the political economy of trade policy. One recent analysis concludes: "Theoretical and empirical work relating [domestic] institutional contexts to trade policy outcomes is in its infancy but should be a promising area of research" (Rodrik 1995, 1485). We seek to help fill this important gap in the literature.

We develop a formal model that emphasizes the role of domestic legislatures in democracies. Central to this model is that the chief executive (i.e., prime minister or president) in a democracy needs the approval of a legislative majority to enact her preferred trade policies.2 Absent such approval, the legislature's preferred policy becomes law. We argue that legislative "ratification" of commercial policy occurs in both parliamentary and presidential systems. In parliamentary systems, ratification is often ex ante; the potential prime minister must negotiate an acceptable trade policy with her legislative majority before taking office. This internal bargain is enforced afterward because the majority can call for a vote of (no) confidence if the prime minister strays from the accepted position in international economic negotiations. In presidential systems, major changes in trade policy usually require legislative ratification ex post.

By contrast, autocracies vest the chief executive with much more authority than democracies. Autocrats do not need a legislative majority to pass their trade policy initiatives; either a legislature does not exist or it rubber-stamps executive proposals. We claim that this institutional difference contributes to a greater tendency for pairs of democratic countries to agree upon lower trade barriers than pairs comprised of a democracy and an autocracy (i.e., mixed pairs). We further demonstrate that whether pairs of autocracies liberalize trade more extensively than either pairs of democracies or mixed pairs depends on the preferences of the

¹ For a few exceptions, see Bliss and Russett 1998, Dixon and Moon 1993, and Morrow, Siverson, and Tabares 1998.

² We are not arguing that autocracies do not need domestic political support. Our point is that autocrats do not require the majority approval of a legislature elected by the public to represent its interests. Autocrats may well depend on the support of such actors as the military or industrialists, but these groups do not represent the voting public.

political decision makers involved, as well as on institutional differences between their regime types. Hence, we can make no prediction about the trade barriers of autocratic pairs relative to mixed pairs or democratic pairs without knowledge of the respective executives' trade policy preferences.

Our focus differs sharply from studies that address how institutional variations among countries with the same regime type affect trade policy. Crucial to the following analysis is that the institutional feature which distinguishes democracies from autocracies is the existence of a popularly elected legislature with the capacity to constrain a country's chief executive. We assume that legislatures are more protectionist than executives in democracies and show that, even so, pairs of democracies are more likely than mixed pairs to liberalize commerce.³ Our focus, then, is on differences across regime types not within them.

The results of an empirical analysis based on the period 1960–90 are consistent with these predictions. Holding constant various economic and political factors, democratic dyads tend to trade more freely than dyads composed of a democracy and an autocracy. Furthermore, no significant difference exists in the openness of commerce within autocratic pairs and within democratic pairs.

THE MODEL

The Actors and Their Preferences

A key difference between an autocracy and a democracy is that the latter is vested with a legislature that has de jure and de facto ratification power over the chief executive's proposals. Because no such institution exists or has such powers in an autocracy, it is modeled as a unitary actor; it has only an executive, who is effectively a dictator and is labeled A. In contrast, a democracy is characterized by two actors: an executive, who may be the president or prime minister, P, and a legislature, represented by the median legislator, C. In what follows, we consider the case in which two countries enter into negotiations to reduce trade barriers between them. The labels A, P, and C refer to the "home" country in these negotiations, whereas A^* , P^* , and C^* refer to the "foreign" country.

In the home country, each of the aforementioned actors tries to maximize its utility by obtaining the greatest possible level of electoral support. That support depends on the trade policy chosen. Every actor wants to enact the level of trade barriers that will maximize its political support (i.e., its ideal point). But each one must strike a balance among the conflicting preferences of its constituents to determine the ideal level. Actors receive political support from a variety of domestic groups. Some groups prefer that the home country lowers trade barriers (e.g., consumers, export-

ers, users of imported inputs, owners of relatively abundant factors), and others prefer that it raises barriers (e.g., import-competing firms, owners of scarce factors). All groups, however, prefer that the foreign country's trade barriers be as low as possible, an outcome that benefits consumers, exporters, and import-competing firms alike. Ceteris paribus, all domestic groups will increase their electoral support for policymakers in the home country if these officials negotiate very low levels of protection abroad. We refer to the home country's trade barriers as t and those of the foreign country as t^* .

The political support function of each actor, U_i , can be expressed as a simple loss function. Every actor has an ideal level of trade barriers at home and abroad, denoted (t_i, t_i^*) , that i would choose if it were not constrained by any of the other actors. All domestic actors prefer the elimination of foreign trade barriers; hence, $t_i^* = 0$ for i = P, C, A, and $t_i = 0$ for $i = P^*$, C^* , A^* . Each actor maximizes its utility by minimizing the difference between the level of protection that it prefers both at home and abroad and the level that actually obtains. For the home country, i's utility function is

$$U_i(t, t^*) = -(t - t_i)^2 - t^{*2}$$
 for $i = P, A, C$. (1)

For the foreign country, its actors attempt to maximize

$$U_i(t, t^*) = -t^2 - (t^* - t_i^*)^2$$
 for $i = P^*, A^*, C^*$.
(1*)

These utility functions imply that the actors' indifference curves are circles. Their utility decreases symmetrically as changes occur in any direction away from their ideal level of trade barriers at home and abroad. Such utility functions are very common to spatial models (e.g., Enelow and Hinich 1984).

Our approach to the making of trade policy is consistent with behavior in both democracies and autocracies. For instance, it captures the notion that democratically elected politicians are motivated by a desire to be reelected, the chances of which grow larger in the face of both rising welfare experienced by voters

³ If legulatures are not more protectionist than executives, then the results depend on the actors' preferences. Differences in trade policy will depend on both institutions and preferences in that case. We focus instead on the case in which the effect of institutional variation is robust to any preference ordering among the players.

⁴ This formulation of the objective functions bears some similarity to Krugman's GATT-think (Ethier 1998; Krugman 1997), in which trade negotiators are motivated by mercantilist notions: Exports are good, imports are bad, and an equal increase in exports and imports is good.

⁵ As implied above, the objective functions 1 and 1* can be seen as the reduced form of a model that combines elements of the underlying economy with a political game of policymaking. For instance, if political support (as in Hillman 1982) is a function of consumer surplus (CS), tariff revenue (T), profits of the import-competing firms (Profits₁), and profits of the exporting firms (Profits₁), then for the home country, $(t_i, t_i^*) = \operatorname{argmax} F(\operatorname{CS}(t, t^*), \operatorname{Profits}_1(t), \operatorname{Profits}_1(t^*), \operatorname{and} T(t))$ for t = P, C, A, where F is increasing in each argument (Hillman, Long, and Moser 1995). The exact form of the function F and the weights placed on each term depend on the underlying market demand and supply conditions, the relative political pressure that each group can bring to bear, and the political institutions that mediate this pressure. This approach is consistent with Grossman and Helpman (1994), who posit that the government cares about a weighted average of social welfare and campaign contributions. Then equations 1 and 1* would be the second-order approximations of a political support function around the ideal points.

and increasing campaign contributions (or lobbying activity undertaken) by organized lobbies, such as industry groups. Hence, trade policies that raise consumer surplus and firm profits increase the political support that a politician receives. Consumers are made better off by a rise in their surplus; and because they vote according to their pocketbooks, their support for the government grows. In addition, as firms' profits rise, they distribute higher profits to consumers (who are also stockholders) and make larger contributions to (or exercise greater influence over) politicians. Note that the government responds to the pressures of both its import-competing and exporting firms. We assume that the government does not have a direct instrument to benefit the exporting sector (such as a subsidy), but it can reduce trade barriers abroad through negotiations and reciprocal concessions, thereby benefiting local exporting industries.

In autocracies, the executive must also maintain political support. The extent of the support provided by consumers and firms often depends on economic conditions. For example, a recent analysis notes that, in the wake of Deng Xiaoping's death, China's autocratic leaders "are acutely aware that a vibrant, flourishing, and progressing economy is the core of their legitimacy" (New York Times, February 21, 1997, A15). Again, trade policy has a direct influence on consumer surplus and firms' profits. Greater consumer surplus means higher real incomes, fewer incentives to riot and rebel, and thus more support for autocratic leaders. Similarly, greater firm profits mean higher incomes for at least some groups (the firm owners), implying increased political support for the autocrat. Whether autocrats care more about consumers and the overall state of the economy or the special interests of firms depends on a number of factors that do not concern us here.

The trade policy preferences of autocrats relative to those of democratic leaders are of central concern. It is unclear whether, on average, autocrats are more protectionist than democratic heads of state. Freed from the need to finance expensive electoral campaigns, autocrats may be more attentive to the economy's performance and hence less protectionist than their democratic counterparts. Yet, if autocrats depend only on the support of a small group of powerful interests, they may be more willing to extract economic rents (through trade barriers and other means) from those sectors of the economy in which these interests do not operate. We handle this difficult issue by varying the preferences of the autocrat relative to those of the democratic executive and assessing how changes in their relative preferences combined with the institutional differences between these two regime types affect our results.

In a democracy, the two main political actors often do not agree on the ideal level of home trade barriers; that is, t_P and t_C are unlikely to be identical. The executive and the median legislator may weigh consumer surplus and firm profits differently in their electoral calculus. Legislators, who represent smaller constituencies than the chief executive, are more easily

captured by special interests than the executive (Mansfield and Busch 1995; Rogowski 1987). We assume that the median legislator cares more about the profits of import-competing firms than about consumer surplus and holds more protectionist preferences than the democratic executive (Lohmann and O'Halloran 1994; Rosendorff 1996). Thus, we assume that $t_P < t_C$ and $t_{P^*} < t_{C^*}$.

All domestic agents prefer that, ceteris paribus, foreign barriers be as low as possible. Ideal values for the domestic trade barriers do vary, however. The median voter theorem is therefore applicable: Single-peaked objective functions over a single dimension imply the median voter is decisive (Black 1958). This similarity of preferences allows us to avoid the cycles associated with median voter models in larger dimensions. We can identify the median legislator as that member who holds the median value for the level of domestic trade barriers, and the legislature as represented by this median legislator.

Each player receives the maximum utility when its ideal trade barrier combination is adopted. Maximum feasible utility for each player is $U^P(t_P, 0)$, $U^C(t_C, 0)$, $U^A(t_A, 0)$, $U^{P^*}(0, t_{P^*}^*)$, $U^{C^*}(0, t_{C^*}^*)$, $U^{A^*}(0, t_{A^*}^*)$.

The Noncooperative Trade Barrier Setting Game: The Trade War

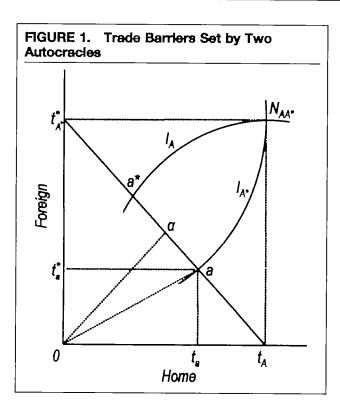

In the absence of any agreement on mutual trade policy concessions, each country is free to set trade barriers only in its own country. Each country sets its trade policy simultaneously, taking the actions of the other as given. The Nash equilibrium to this noncooperative trade barrier-setting game can be considered the "trade war" outcome, which is what we assume occurs when countries do not agree to mutually acceptable trade barrier concessions. Political leaders at home have authority over t. Foreign barriers (t^*) are controlled by the foreign government. When both countries are autocratic (denoted AA*), each executive determines the level of trade barriers in her country. Consider the problem facing the home autocrat, A, who maximizes equation 1 taking t^* as given. A's reaction function is independent of t^* and hence is vertical at t_A . Similarly, \hat{A}^* 's reaction function is independent of t and hence horizontal at $t_{A^*}^*$. The Nash equilibrium is the pair of preferred trade barrier levels (t_A, t_{A^*}) chosen by the home and the foreign autocrat. In Figure 1, this point is labeled N_{AA} . Note that both parties could be made better off if they could negotiate to a point on or closer to the Pareto frontier, $t_A t_A^*$.

When one or both countries are democracies, we assume that the legislature $(C \text{ or } C^*)$ has the final say on domestic trade policy. Again, each domestic play-

⁶ Throughout, we assume that there is a meaningful difference between their preferences; we assume that $t_C > 2t_P$ and $t_C^* > 2t_{P^*}^*$.

⁷ This follows from the additive separability of t and t^* in the objective functions in equations 1 and 1*.

This assumption is not necessary for our results. If the legislature simply has some ability to force the executive to take its preferences into account in the event of the trade war outcome, then our results

er's ideal domestic policy is independent of the actions of the foreign player (and vice versa). When the home country is a democracy and the foreign one is an autocracy (denoted DA^*), the best-response functions call for C to implement t_C for any value of t^* and for A^* to play t_A^* , irrespective of t. The noncooperative game between home and abroad has as its equilibrium $N_{DA^*} = (t_C, t_A^*)$, as labeled in Figure 2A, B, and C. Realized returns to C, P, and A^* are $C(t_C, t_A^*)$, $P(t_C, t_A^*)$, and $A^*(t_C, t_A^*)$. These returns are lower than the respective optima $C(t_C, 0)$, $P(t_P, 0)$, and $A^*(0, t_A^*)$. Pareto improvements are possible; if C, P, and A^* can agree to mutually reduce trade barriers (slightly) from (t_C, t_A^*) , all could gain.

Finally, when both countries are democracies (DD^*) , the Nash equilibrium is set by the two legislatures. In this case, failure to find mutual concessions leads to point $N_{DD^*} = (t_C, t_{C^*}^*)$ in Figure 3.

leads to point $N_{DD^*}=(t_C,t_{C^*}^*)$ in Figure 3. In all three cases, the Nash equilibrium to this simultaneous game of trade barrier setting is the defect-defect outcome in the prisoners' dilemma. If the countries do not cooperate, they will choose a level of trade barriers at home that is ideal, but that results in a higher level abroad than they ideally desire. Since both countries make such a choice, they end up at the noncooperative Nash equilibrium, which is not welfare maximizing. If they coordinate their trade policies, then they can both achieve welfare gains. As such, the problem facing political leaders is to reach a pair of trade barrier levels closer to their optima, and this necessarily involves mutual concessions.

are maintained. The legislature's preferences must simply affect a democracy's unilateral, noncooperative choice of barriers.
